1Introduction

The only reasonable solution is to dismember the [computer] manuals, study them for six months under the guidance of an Etruscologist, condense them into four file cards (which will be enough), and throw the originals away.

U. Eco, “How to Follow Instructions” (1994, 141)

1Why Etruscans and Etruscology?

Although the Etruscans are the third ancient civilization in western Europe after Greece and Rome, in contemporary culture they are almost a synonym for mystery, and Etruscologists are thought to be able to solve mysteries—as Umberto Eco ironically confirms.¹ In European culture this opinion is deeply rooted. The Greek historians Herodotus (fifth century BCE) and Dionysius of Halicarnassus (first century BCE) raised the Etruscan question and attempted to clarify the mysterious origins and language of this people in two different ways—the first declaring origins among the Lydians, the second among the Italics. This situation was exacerbated by later events. The twenty books of *Tyrrhenika*, “Etruscan matters,” written in Greek by the Roman emperor Claudius (10 BCE–54 CE), as well as other ancient texts on the Etruscans, are lost, and this is not by accident. For several reasons, Christian authors identified the Etruscans as pagans, and monks in the Middle Ages deliberately did not copy Greek and Roman literature on non-Christian peoples. This situation changed in the late Middle Ages and especially in the Renaissance, when Etruscan objects and monuments came to light and archaeology began to play the primary role in defining the Etruscans. Details of Etruscan sepulchers were drawn by the two greatest artists of the Renaissance, Leonardo da Vinci (1452–1519) and Michelangelo Buonarroti (1475–1564). Etruscan studies were carried out especially in Italy, but not exclusively by Italian scholars; the first modern book was written in Latin by the Scottish humanist Thomas Dempster in the seventeenth century and was published a hundred years later in Florence.² Its publication increased the fascination with the Etruscans in the eighteenth century and spawned *Etruscheria* (“Etruscomania”), the amateur passion for them.

A scientific development closely connected with Italian culture followed the early interest in *Etruscheria*. An important step was the Chair of Archaeology established in 1810 at the University of Perugia and maintained

until 1877, dealing with Greek, Etruscan, and Roman archaeology.³

Interest in the “mysterious” Etruscans in the following years suffered long breaks, interrupted by important archaeological discoveries, such as the temple and statues found at Veii from 1914 onward, which helped arouse interest and establish modern Etruscan studies. Modern Etruscan studies are closely connected with the name of Massimo Pallottino (1909–1995), who held the Chair of Etruscology at the University of Rome “La Sapienza” from 1942 to 1980 and founded Etruscology as a modern scientific discipline. He was the acknowledged authority in studies of pre-Roman Italy not only in his own country but all over the world, founding and leading a summer school in Etruscology and Italic studies reserved for non-Italian scholars at the University for Foreigners of Perugia. In Pallottino’s view, Etruscology and Etruscologists study every aspect of Etruscan culture—as Egyptology and Egyptologists do for Egyptian culture—literacy tradition, inscriptions, art, archaeology, and so on, which are used to construct a general historical framework. The Etruscologist is mostly a historian. Pallottino expressed his thoughts in a major work, *Etruscologia*, which was firstly published in 1942 by the established Italian publisher Hoepli, famous for its series of handbooks. Over the next four decades, the book underwent six new editions, each one systematically revised by the author, which made it the standard work on the subject.⁴ After Pallottino’s death, *Etruscologia* was reprinted in Italy in 2006. The comprehensive text, which has been translated into all the major languages of Europe (English, French, German, and Spanish, plus Hungarian, Polish, and Portuguese) and has been adopted by several generations of Etruscology students, was a milestone not only for the subject, but also for Italian culture. The availability of such an important book influenced the publication of further volumes on Etruscan culture, in all major languages by many authors. The constant increase in specialization and the incessant progress of archaeological discoveries have by now made it impossible for a single scholar to control all the information and to write a comprehensive text; it is no accident that the volume intended to update *Etruscologia* is written by eleven authors under the direction of Gilda Bartoloni, a pupil of Pallottino.⁵ The best way to satisfy the universal interest in the “mysterious” Etruscans is an exhaustive book covering them in English.

Several general books on Etruscans, including the first dictionary, have recently been published in English and confirm that large publishing projects are still a very modern way to disseminate archaeological results.⁶ Some recent books are similar in certain respects to the present one. The large number of contributors and their international provenance reflect the high level of specialization and the worldwide undertaking of research on the Etruscans. Some statistics may be of interest: sixty-seven authors from eleven countries have written ninety chapters (three have two authors). If the sixty-seven authors are divided by nationality, thirty-nine are from Italy, seven from France, six from Austria, four from the United States, three from Switzerland,

two each from England and Germany, and one each from Lithuania, Spain, Sweden, and the Netherlands. If the sixty-seven authors are divided by institution, thirty-one are from Italian institutions, eight from French, seven from Austrian, five from American, four from German, two each from English and Swiss, and one each from Canadian, Dutch, and Swedish universities; five authors are independent scholars. Thus geographic mobility slightly changes the picture of nationality, and although Italian scholars are the most prolific and mobile, Etruscology is an international matter. If the ninety chapters are divided by institution, forty are from Italian institutions, thirteen from Austrian, eleven from French, eight from American, four from German, three from English, two each from Dutch and Swiss, and one each from Canadian and Swedish universities; five are by independent scholars. Similar results can be reached if the ninety chapters are divided by author's nationality: fifty-five are by Italians, ten by French contributors, eight by Austrians, six by Americans; and three each by English and Swiss, two each by Dutch and German, and one each by Lithuanian, Spanish, and Swedish authors. Scholars in Etruscology are thus disseminated all over the world, but they are concentrated in Italy, followed by France and Austria. This is not an accident, but corresponds exactly to the chairs of Etruscology in the universities of these nations. Twenty-eight Etruscologists form a special group in the Italian academic system of *Scienze dell'Antichità*, and in the 2014–2015 academic year they were active in twenty-two universities.⁷ Although Etruscology chairs have not been established in France, where research on Etruscan culture is traditionally carried out by Classical philologists, lectures on Etruscan archaeology are held at the *Ecole du Louvre* in Paris; at the University of Vienna in Austria a chair of *Etruskologie und Italische Altertumskunde* has been established. In England, a Sybille Haynes Lectureship in Etruscan and Italic Archaeology was recently created at the University of Oxford. Two positions—in Germany at the University of Tübingen and in Belgium at the University of Louvain la Neuve—have no longer been active in Etruscology. It must be added that scholars from several countries are mainly concerned with the Etruscans but officially teach other archaeological disciplines: the present editor held from 2008 to 2015 the chair of *Ur- und Frühgeschichte* at an Institute with a long tradition of research on Iron Age Italy.⁸

Other institutions focusing on the Etruscans may be mentioned, such as the *Istituto di Studi sul Mediterraneo Antico* of the *Consiglio Nazionale delle Ricerche* (Rome) and the *Unité Mixte de Recherche Arche'ologie et Philologie d'Orient et d'Occident* supported by the *Centre National de la Recherche Scientifique* and the *Ecole Normale Supérieure* (Paris). The leading institution in Etruscan studies, the *Istituto Nazionale di Studi Etruschi e Italici*, founded in 1925 in Florence, which has published the journal *Studi Etruschi* since 1927, organizes scientific symposia, and includes sections in Austria, France, Germany, and the United States.⁹

This wide range of scientific activity allows us to conclude that the Etruscans may be mysterious primarily for publishers and readers, both of whom love mysteries.

2Authors and structure of the book

If Pallottino as founder of modern Etruscology and his immediate pupils formed respectively the first and second academic generations of Etruscologists, the scholars on duty in this book—including the present editor and most of its authors—are the third and fourth generations, with some second generation exceptions. The aim of such a balanced mixture between innovation and tradition is an up-to-date and reliable handbook. The choice of author for each contribution followed three distinct principles. First, several Etruscologists have been asked to deal with subjects that are quite new for them, to augment their interest and to avoid routine chapters. Second, some scholars have been invited to contribute to this book even though they were not specifically interested in Etruscan subjects, because they have new approaches and bring new light to old questions. Third, some very technical subjects in need of vast direct experience could only be treated by a few scholars. In such cases an editor has no real choice, as is shown by comparing the tables of contents of the above-mentioned general books and the present one: often the same author deals with the same theme in several places.

This handbook is in two main parts: critical reviews of methods and main issues (part 1), and syntheses of history, civilization, the landscape of Etruria, and Etruscans outside Etruria (part 2).

2.1Part 1

Because the Etruscans were a cultural bridge between differing times and areas (protohistory and history, East and West, Greece and Rome), Etruscology deals with many aspects extending throughout the first millennium BCE, from protohistory to Roman times, from the classification of Iron Age artifacts to the history of art proper. Therefore it has never developed a methodology of its own but needs multiple approaches to this wide range of subjects. The first section of part 1 (**chapters 2–8**) is devoted entirely to methodology in the history of Etruscology, from the question of the origin of the Etruscans to images of the Etruscans in Greek and Latin literature, from the earliest phases of the discipline to modern interpretations of art and iconology, including recent research on DNA analysis. The study of the Etruscan language, known exclusively through ancient inscriptions, has always had a special role and therefore needs a special treatment of its

methodology.

“Issues” offers a combination of major subjects typical of any important ancient civilization along with some areas where Etruscans were preeminent in the ancient world (section II, **chapters 9–31**). The issues discussed include three thematic divisions, devoted to politics and society (political organization and magistrates, economy and trade, war, society, wine culture, banqueting and food, sports, dance, alphabets and language), religion (religion, death and burial, haruspicy, prophecy and divination), and finally technology (ships and shipping, harbors, vehicles and roads, mines and metalworking, the mines on the island of Elba, coins and mints, weights and balances, textiles and dress, musical instruments, gold dental appliances). Such issues are not particularly new for Etruscologists, but it is new to have all of them together in one place. The present volume aims to be systematic, but some aspects are missing. Current knowledge of certain subjects, such as the Etruscan system of measures and demography, seem to be too limited to provide an exhaustive overview.

2.2Part 2

The third section, dedicated to history, opens the second part of this book. Etruscan civilization corresponds to the first millennium BCE and has been divided schematically into five main periods (all dates earlier than the first century mentioned in this volume are assumed to be BCE unless otherwise marked):

1. Early Iron Age, 10th cent.–730
2. Orientalizing period, 730–580
3. Archaic and Classical periods, 580–450
4. Late Classical and Hellenistic periods, 450–250
5. Etruria and Rome, 250–89

The development of Etruscan history is covered accordingly in five chapters, which are introduced by a general historical framework dealing with a thousand years of Etruscan history and related events, and are followed by a portrait of the Etruscan legacy in Roman civilization (section III, **chapters 32–38**). Each chapter deals with the main event of a period, corresponding to the development from village to city for the Early Iron Age, the diffusion of Near Eastern cultures for the Orientalizing period, urban civilization for the Archaic and Classical periods, the diffusion of Hellenism in central Italy for the Late Classical and Hellenistic periods, and the relationship with Rome for the Republican age. There follows the treatment of Etruscan civilization under its five main periods, each including six subjects: art, handicrafts, society, ritual and cults, economy, and external relationships (section IV, **chapters 39–68**). The systematic structure, which aims to give an overview so that

similarities can be compared and differences marked between the periods, was inspired by Renato Peroni's impressive book on Italy in the Bronze Age.¹⁰ Following established criteria in Classical studies, the chapters on art deal with the three main fine arts: sculpture, architecture, and painting; while vase painting and pottery, bronze vases, jewelry, and small finds are grouped under handicrafts. The individual treatments of economy and society in these groups of chapters are more detailed than the general reviews in part II (chapters 10 and 12). In general, possible overlaps throughout the book should not be considered a drawback, but an enrichment that provides the reader with a finer orientation to this volume's more than 1,700 pages.

Sections V, Topography of Etruria, is devoted to environmental and topographical descriptions of the southern and northern districts of Etruria (section V, chapters 69–72). Section VI outlines the presence of the Etruscans outside Etruria in Italy (chapters 73–78) and then reviews Etruscan interaction and trade first in non-Etruscan Italy; then in south central and central Europe; and finally in the Mediterranean area, including Corsica (included here by convention, although it had a real Etruscan presence), Sicily, Sardinia, Greece and the Levant, North Africa, southern France, and the Iberian peninsula (chapters 79–90).

The maps deserve special mention due to their importance in the book: forty maps have been drawn, including both new subjects, such as the development of Etruscan cities over the five historical periods and the distribution of Etruscan inscriptions, and traditional themes, such as the natural landscape, the ports and related cities of Etruria, metallic ores and other resources in Etruria, the distribution of Etruscan finds in and outside Italy, and the distribution of some overseas items in Etruria.

3Acknowledgments

My most sincere thanks are due all the authors; they supported a scientific enterprise with their written contributions. As editor I conceived the plan of the book and I am responsible for it and any mistakes.

The general aid of the Leopold-Franzens-University Innsbruck is particularly appreciated: Rektor Tilmann Märk and Vizerektorin Sabine Schindler provided generous funding for the illustrations, Vizerektor Wolfgang Meixner facilitated the granting of a sabbatical term, and Dekan of the Philosophisch-Historisch Fakultät Klaus Eisterer supported the publication of *Etruscology*. Several colleagues furnished not only contributions, but also advice on the structure of the book. Andreas Blaickner and Michael Schick, draftsmen at the *Institut für Archäologien*, drew respectively all the maps and the pictures of musical instruments with invaluable competence. The publishing house of the Römisch-Germanisches Zentralmuseum (Mainz)

supplied the base map that was used for all the maps. Special mentions are reserved to the museums conservators which allowed to publish the images, particularly Deutsches Archäologisches Institut Rom (DAI Rome), Soprintendenza Archeologia del Lazio e dell'Etruria Meridionale (SAR-Laz), and Soprintendenza Archeologia della Toscana (SAT).

Michiel Klein-Swormink in winter 2010 suggested that I edit a Handbook of Etruscology for de Gruyter. My enthusiastic and naïve acceptance has been followed by seven years of hard work, first creating an outline of the book, then contacting the authors, and lastly performing the delicate job of editor. Dr. Serena Pirrotta of de Gruyter assisted with contacts with museums and other collections to obtain permission to reproduce the images. The copyeditor Aaron Ostrow was a fine work companion. Special thanks are due all them.

2An ancient question: the origin of the Etruscans

Abstract: In the ancient written sources contradicting views are held as to who the Etruscans were and from where they originated. Modern scholarship has been content to pick out one of the ancient concepts and to support it with historical, archaeological or linguistic arguments. As a result, there is still no consensus in this matter. An important reason for this is that the opinions held in modern scholarship are also closely linked to the ideological environments in which they are set. In an attempt to render these correlations as transparent as possible, this chapter attaches more importance to contextualizing the ancient written sources and the positions taken by modern scholarship than to mentioning and describing them as “exhaustively” as possible.

The chapter also draws attention to the interferences between the ancient written sources, the hypotheses regarding the Etruscan language and the interpretations of archaeological findings. To avoid the circular reasoning so frequent in academic debates, it is argued, one must follow the fundamental call in the methodological debate in archaeology to contextualize and interpret archaeological findings initially on their own. The archaeological settings, local and trans-regional correlations between findings can only be given meaning in a scientifically transparent manner, where specifically defined and clearly described analogical cases from the fields of anthropology and history are used. This, in fact, forms the basis for the more recent reflections on the possible internal structures of the settlements and cities and the connections between them. These reflections become all the more compelling, the less they depend upon the alleged knowledge of the “Etruscans” in the ancient written sources.

Keywords: Herodotus, Dionysius of Halicarnassus, written sources, Tyrsenoi, Tusci

Introduction

The ancient written sources hold contradictory views as to who the Etruscans were and from where they originated. Modern scholarship has been content to pick out one of the ancient concepts and to support it with historical, archaeological or linguistic arguments. As a result, there is still no consensus in this matter.¹¹ An important reason for this is that the opinions held in modern scholarship are also closely linked to the ideological environments in which they are set. In an attempt to render these correlations as transparent as possible, the following chapter attaches more importance to contextualizing¹² the ancient written sources and the positions taken by modern scholarship than to mentioning and describing them as “exhaustively” as possible.

1The written sources

1.1Tyrsenoi in the northern Aegean: The ancient sources up to Herodotus of Halicarnassus

The Tyrsenoi are first mentioned in Hesiod's seventh-century *Theogony* (line 1016), in which Circe bears three of Odysseus' children, Agrius ("the Wild One"), Latinos and Telegonus ("born afar"), who reign over the Tyrsenians far away among a set of islands. The location serves solely to create a mythical displacement for the narrative and does not refer to a specific place or to Italy. This obvious vagueness with regard to location is corroborated by the Homeric hymn to Dionysus (7.6–8), which probably dates from the sixth century and in which the god Dionysus is robbed by the Tyrsenoi in the northern Aegean.

This localization of the Tyrsenians is in keeping with Herodotus (1.56–57), who created a local link between the Tyrsenians and the Pelasgians. The Tyrsenians are only mentioned as an appendix to the narrative in which Croesus, the King of Lydia, intends to seal an alliance with the greatest powers (*dynatotatoi*) in Greece against the Persians. In characterizing the Lacedaemonians and Athenians, Herodotus also draws on mythic history. The Lacedaemonians are a Hellenic *ethnos*; they once lived in Thessaliotis (the ancient name of modern Thessaly, with different borders), or Phthiotis, to be more precise, migrating in stages farther south and finally settling in the Peloponnese, by which time they were known as the Dorians. The Athenians are a different case in point. They are a Pelasgian *ethnos* and as such always remained in the same location, i.e. in Athens. To become a Hellene, they had to relinquish the Pelasgian language in favor of Greek. The Pelasgians were previously neighbors with the Dorians and likewise lived in Thessaliotis. This is confirmed by the geographical reference, which in the context of the narrative can only refer to the Aegean region. It states that Pelasgians can still be found today "above" the "Tyrrhenoi" who live in the city of Creston.¹³

1.2Migrating ethnic groups: The new way of thinking following the Persian Wars

Herodotus' concept of Tyrsenian identity is inconsistent; it varies depending on the context. This is noteworthy in that the main argument for assuming the Etruscans came to Italy from the East was derived from a different widely cited passage (Hdt. 1.94).

One of the most important themes in Herodotus' portrayal is his call for an

awareness of Hellenic unity to be formed against the backdrop of the Persian campaign against the Hellenes. To create a foil for his appeal for Hellenic unity, he sheds light in the narratives (*logoi*) of foreign peoples on the regions bordering the eastern Mediterranean. The Lydian Logos comes at the start of the first part of Herodotus' narrative, which stakes out the setting for the Persian campaign. The widely debated account of the Lydians being divided into two halves and drawing lots to decide which half of the population must emigrate, is just part of the detailed etiology as to why the Lydians are thought to have invented many games. Using the fable motif—a famine lasting eighteen years—as the trigger for emigration is very much in keeping with the casual nature of the narration. This also ties in with the fact that the emigrants' journey to their destination, the land of the Umbri on Italy's west coast, is not described in any greater detail. This is striking and stems from the vague geographic perceptions of the western Mediterranean at that time: Herodotus believed that Italy's west coast did not run south to north, but that the southernmost tip of Italy continued almost directly west and that Sicily, Sardinia and Corsica formed a line opposite Italy.¹⁴ In accord with the pattern that emerged in the fifth century of establishing colonies, Herodotus states that the Lydians also established cities in Umbria and named themselves the Tyrsenians after their leader Tyrsenus.

Besides the mythical motif of "famine," Herodotus names a second motif to explain why half of the Lydians emigrated. He asserts that this half of the population was not subjected to servitude by the Persians.¹⁵ Accordingly, this narrative appears to have been influenced by the experience of the Persian Wars, as is the case with the migration of the Phocaeans, which is described in much greater detail.¹⁶ Herodotus later describes the latter as the first Hellenes to have undertaken great voyages across the sea (1.163–67).

Herodotus' presumably younger contemporary Hellanicus of Lesbos united the two lines of discourse, concerning the Tyrsenians and the Pelasgians, which Herodotus had treated separately. The preserved fragment¹⁷ clearly shows that the history of the Tyrsenians has been greatly altered. The Lydians, who according to Herodotus migrated to the West, are replaced by the Pelasgians. By asserting that the Tyrsenians were once called Pelasgians, he encounters the problem that the oldest narratives placed the Tyrsenians in the northern Aegean alongside the Pelasgians. In addition, like Herodotus, he offers a genealogy as alleged proof to support his opinion. Accordingly, the eponymous ancestor Pelasgus is said to have fathered Phrastor with Menippe; Phrastor's son was Amyntor, whose son Teutamides fathered a son called Nanas.¹⁸ Hellanicus, however, cites a completely different reason for migrating: under the rule of Nanas, the Pelasgians were expelled from their land by the Hellenes, landing on Italy's east coast, at Spina, initially settling in Cortona, and finally colonizing the interior, which today bears the name Tyrsenie. Contrary to Herodotus, they did not lend their country their name but changed their name to that of the country. Hellanicus clearly undertakes a

process of geographical rationalization by dislocating the Pelasgians from the realms of myth and placing them on the west coast of Italy, which was then well known to the Hellenes.

Presumably, as knowledge of the Italian coastline grew in the wake of the Peloponnesian War, Hellanicus transferred the Tyrsenians to the then familiar west coast of Italy. This is reflected in the fourth century in the work of Ephorus of Cyme. In the fragment referring to Sicily (Strabo 6.2.2), Naxos and Megara are said to have been the first Hellenic settlements in Sicily in the tenth generation after the Trojan War. He justifies this by asserting that the earlier Hellenes feared the Tyrsenian pirates and the cruelty of the Barbarians there. At the same time, he appears to have superseded Hellanicus's attempt at identifying the Pelasgians and the Tyrsenians since Strabo (5.2.4) cites him and asserts that the Pelasgians were originally Arcadians and had migrated from Arcadia to Crete.¹⁹

1.3 The relationship between the island of Lemnos and Athens

Where Thucydides of Athens (4.109) describes how the Spartan commander Brasidas had taken Amphipolis in the Peloponnesian War and moved up to the canal built by the Persian King Xerxes to the farthest outlying peninsula of Chalkidike, he names several cities to help his readers gain their bearings. He also mentions—almost in passing—that these cities were inhabited by bilingual barbarians: Pelasgian, Bisaltians, Krestonians and Hedonians. The Pelasgians, it is said, originated from the Tyrrhenians, who had once populated Lemnos and Athens. Thucydides apparently refers here to the link between Athens and the Pelasgians known to Herodotus (1.57). According to Herodotus, however, Lemnos had always been Pelasgian; even during Darius' reign, Pelasgians lived on Lemnos and Imbros (Hdt. 1.145). Only later they were displaced by the Athenians, finally settling on the Peloponnese (Hdt. 1.136–137). By comparison, Thucydides blends the Pelasgians with the Tyrrhenians, and as a result, in Thucydides, Lemnos becomes Tyrrhenian.

In contrast to Herodotus, Thucydides' geographical awareness is similar to that of Ephorus (Thuc. 4.24), whereby the Sicilian and Tyrrhenian Seas (*tyrsenikon pelagos*) meet in the strait between Rhegium and Messene (modern Messina); the Tyrrhenian Gulf is to the right of the ships sailing along the coast of Sicily towards Himera (Thuc. 6.62: *tyrsenikos kolpos*).²⁰ Although Thucydides appears to be clear about placing the Tyrsenians in western Italy, he was not aware of any Tyrsenians migrating to the west. The Tyrsenians (= Pelasgians of Lemnos) only come as far as Athens. As a consequence, he had no concept of a Tyrrhenian Sea in the northern Aegean.

Only when Thucydides' text is blended with Herodotus' version—and

ignoring the fact that Thucydides believed the Tyrrhenians only got as far as Athens—can one assume that the Tyrrhenians in Etruria originated from Lemnos. This kind of arbitrary compilation does not appear until the third century BCE in Anticleides of Athens.²¹ The short fragment states that the Pelasgians were the first to establish Lemnos and Imbros, and that some of them had migrated to Italy together with Tyrrhenus, son of Atys.

1.4 Autochthonous Tyrsenoi: A Greek perspective on Rome

Linking mythical narratives to present-day intentions explains why the Roman authors, whether Cicero (*Div.* 1.12, *Cat.* 31.13), Virgil (*Aen.* 8.79–80), Horace (*Sat.* 1.6.1), Ovid (*Met.* 576–77) or Tacitus (*Ann.* 4.55), refer exclusively to Herodotus’s version of the Tyrsenian discourse, which asserts that the Tyrsenians were Lydians. They use it to substantiate in simple terms the contrast between Rome and the Etruscans.

The perspective taken by the Greek Dionysius of Halicarnassus, who lived in Rome, is quite different. His aim is to prove that Rome is a Greek colony (*apoikie*) created through the process of synoecism.²² He contrasts this mix of different ethnic groups with the Etruscans as an autochthonous unit. For this reason, he criticizes all other versions of Tyrsenian heritage that were in circulation at that time (Dion. Hal. *Ant. Rom.* 1.27–30). His genealogy of Lydian rulers differs from that drawn up by Herodotus (1.27): Tyrrhenus, the colony’s leader (*hegemon*), was born into a Lydian clan (*genos*), which Dionysius of Halicarnassus leads back almost to the earliest of the gods. Manes was born of Zeus and Gaia and has a son, Atys. Once again in contrast to Herodotus, Atys, with Callithea, fathers Lydus and Tyrrhenus, after whom their “peoples” are named five generations later. The Lydians lived in the country formerly known as Maionia; Tyrrhenus left due to famine.

Dionysius is familiar with other variations of Herodotus’s version (1.28). Tyrrhenus is also said to be a son of Heracles and the Lydian Omphale and to have driven the Pelasgians out of the cities north of the Tiber in Italy(!); alternatively, Tyrrhenus is said to be a son of Telephus, who came to Italy after the Trojan War. Xanthus of Lydia, on the other hand, asserted that Tyrrhenus was not part of Lydian genealogy; he likewise had no knowledge of a Maionian colony in Italy or of a Lydian colony known as Tyrrhenia. The sons of Atys were Lydus and Torebus; they each ruled over the Lydians and Torebians in Asia. Speaking different tongues, they taunted each other like the Ionians and Dorians. Dionysius also cites the version by Hellanicus and one by a certain Myrsilos; the latter turned Hellanicus’ portrayal around, such that the Tyrrhenians became Pelargians. After the Tyrrhenians had left their home, they adopted the new name of Pelargians because of their similarity to storks

(*pelargoi*). They wandered around in Greece and the land of the Barbarians in groups; the Pelargian Wall at the Acropolis in Athens is said to have been named after them.

Dionysius challenges all these variations about the Tyrrhenians, Lydians and Pelasgians with his own version (1.29). He makes a clear distinction between the Tyrrhenians and the Pelasgians, and concludes that it would be as wrong to mix the two simply because they lived alongside one another as it would be to throw the Trojans and the Phrygians in the same pot. Based on this argument, one could also deny the differences between the Latini, Umbri and Ausonians. Given that differences tend to blur the farther away the observer, he states that the Hellenes referred to them all as Tyrsenians and they called Rome a Tyrrhenian city. However, Dionysius then proves to be somewhat indecisive as to whether they all had the same origin despite the fact that they speak different languages.

He makes a distinction between Tyrrhenians and Pelasgians and asserts that the Pelasgians were involved in founding Rome (1.30). He states that the Greek tendency to equate the Pelasgians with the Etruscans and with Rome is, however, incorrect. Moreover, he explicitly stresses that the Tyrrhenians did not colonize the Lydians, that they did not share a common—or even a related—language, and that they did not worship the same gods or observe the same customs. He continued that they cannot be compared, since the Tyrrhenians are “found to be a very ancient nation and to agree with no other either in its language or in its manner of life”

He underlines this by pointing out that the Romans gave the Tyrrhenians a different name: Etruscans, after Etruria. He believes that their former name was “*Thyoskooi*,” but that they referred to themselves as *Rasenna*.

1.5 How should the Hellenic perspectives be read?

It is clear that the different narratives function as part of a construct to explain and justify the circumstances and conditions of the day.²³ The “pre-history” used with this intention clearly displays the characteristics of a mythical story. It is also evident, however, that the genealogical relationships, traced all the way through to the heroes of the Trojan War, form part of an attempt to squeeze the many parallel yet differing narratives into a common chronological system.²⁴

Under these circumstances, it is problematic to proceed on the assumption of “peoples” or even of linguistic units such as the Tyrsenians and Pelasgians. Rather, a Tyrsenian discourse and a Pelasgian discourse²⁵ must be presupposed. The discourse that dominates the narrative, or the manner and extent of their intermingling depends largely on the author’s intent. The longevity of the two discourses confirms their inherent flexibility but not their historical validity. Accordingly, Dionysius of Halicarnassus (1.17) was also

able to create a link between the Pelasgians and Sicily from the perspective of his day. The Pelasgians were said to have once lived in today's Thessaly; they were forced to leave their home, becoming neighbors of the Aborigines and joining forces with them in the fight against the Sicels. In this context, Dionysius also conveys the belief that groups of Pelasgians who had settled in Dodona had to leave the country again, landing on the opposite coast of Italy (1.18). It is this construction that becomes a prerequisite for the subsequent narrative (1.20), in which these Pelasgians fought against the Umbri and conquered Croton.²⁶

The only deductions permitted with any certainty by the abovementioned narratives are thus that the Greeks on the Balkan Peninsula and in Asia Minor were familiar with the names of the Umbri and Tyrsenus/Tyrsenoi, that they placed Umbria in central Italy, and that, as their geographical knowledge improved, they located Tyrsenoi north of Sicily.

1.6 Rome's ethnographic view of the North

Whereas Dionysius sees the Etruscans as part of his concept of Rome's Greek origins, Livy believes Rome to be the unequivocal center of the earth in relation to which all other peoples should be considered, and mentions the Etruscans in connection with the Gaul's advance into the Po Valley and their battles with the Etruscans living there (5.33.5–11). In the period prior to Roman rule, Livy states, the Etruscans populated the Tuscan and Adriatic coasts, and established cities also beyond the Apennines across to the Alps. The peoples in the Alps, and the Raeti in particular, were of the same origin. In an ethnographic manner, he equates them to the uncivilized peoples on the northern edge of Italy. He believed that the Etruscans in the Alps had adopted the savagery of their surroundings and that the only part of their Etruscan heritage that had been preserved, albeit distorted, was the sound of their language.

Pliny the Elder thinks along the same ethnographical lines as Livy when he asserts in his panoramic view of the ancient world that the Raeti were Etruscans. The Alps were, he said, populated (*HN* 3.20.133) by *multi populi*, including the *Raeti et Vindelici*. He claims that the Raeti were descendants of the Tusci displaced by the Gauls; their leader was known as Raetus. In the description of Umbria and the *ager Gallicus* (*HN* 3.14.112) he follows the (Greek) tradition that the Umbrians were—allegedly—the oldest *genus* in Italy. He states that the Umbrians drove the Sicels and Liburnians out of the region around Palma, Praetutia, and Adria; the Etruscans then conquered 300 Umbrian cities. In the context of the threat to Rome by the Gauls, Pompeius Trogus (*Just. Epit.* 20.5.10) refers to the Etruscans in passing: when the Gauls came to Italy, they drove the Etruscans out of the Po Valley; the Etruscans were forced back into the Alps and formed a tribe led by Raetus, which was

named after him.

2 Positions and Tendencies in Modern Scholarship

The clear parallelism between the differing narratives about the Etruscans and their intertextuality²⁷ was widely negated in a move to determine the “beginnings” of the Etruscans. Instead, attempts have been and are being made to pick just one of these narratives as the source from which knowledge is distilled right back to the origins of the Etruscans, i.e. to the second millennium. The choice of narrative depends largely on the premise for historical reconstruction prevailing in the scholars’ surroundings. These correlations can only be presented here as dominant trends since the detailed analyses required to achieve greater precision are yet to be conducted.²⁸

2.1 Etruscheria, Etruria and the unity of Italy

Cosimo II de Medici in Florence was identified in connection with alleged Etruscan kings by Thomas Dempster in his 1616 manuscript *De Etruria regali libri septem*, which did not become widely known until it was published in the early eighteenth century. The timing is no coincidence, but occurred as a consequence of a keen interest in the Etruscans emerging from the “discovery of peoples” in the period of Romanticism and for which the term *Etruscheria* was coined.²⁹

Following in Dionysius’ footsteps, Dempster deemed the Etruscans to be the only autochthonous people in the region, also pinpointing their language as one that differed from all other ancient tongues. Dempster also considered the Pelasgians and Lydians as invaders comparable with the Barbarians of the Middle Ages. This form of rapturous romanticism also led to comparisons being drawn between the Etruscans and the Egyptians and to almost all cultural achievements being ascribed to the Etruscans. Etruscan Art was allegedly superior to Greek Art, and the vases unearthed in ancient tombs were said to be of Etruscan origin. These convictions were among the factors triggering the creation of Etruscan art collections, initially in Florence and Verona, and later beyond Italy’s borders.³⁰

This tremendous appreciation of the Etruscans also had a political element. In the construction of the past during the *Risorgimento* (unification) of Italy, the Etruscans could always be set against the dominant Romans as an autonomous cultural and political force to be reckoned with.³¹ Of similar importance were the Italics who, likewise, formed an autonomous world independent of the Romans and Greeks. In line with the premise that language is the expression of a people, this particular “myth of Italy”³² also embraces

the view that the tongues of the Italics and Etruscans were related.

In his portrayal of the Etruscans, which for a long time was the most detailed and had a lasting impact far into the twentieth century, the German historian Karl Otfried Müller consciously placed himself within the ranks of the “Tuscan scholars.”³³ In the wake of the historical source criticism by Barthold Georg Niebuhr, Müller was keen to dissolve the apparent contradictions between the various ancient reports by creating a chronological order. He believed the different mythological narratives were reflections of the sequence in which the various peoples migrated to, from and within Italy. He states that in the course of these movements, the Tyrsenians also came to Italy from Greece and settled in Tarquinia. The subsequent contradictory line of argument can only be explained by his heritage and German tradition of thought. From the link made by Dionysius between the Rasenna and the Raeti, he draws the conclusion that the Rasenna of the Alps advanced against the Apennine, driving out the Umbrians, settling in Etruria and mixing with the Tyrsenians from Tarquinia. This, he believed, was the origin of the Tuscan people.

Müller considered all source genres and puzzled together his (re)construction from almost all the available elements, leading to the different hypotheses regarding the origins of the Etruscans to the present day. He also based his argument on the criteria still used in Etruscology as a means of evaluating the written sources: that is, the Etruscan language and archaeology. Since these two fields are particularly suited to projecting personal (ideological) positions, he was trapped within the resultant circular reasoning: the decisions regarding the character of the Etruscan language, the “right” interpretation of the archaeological findings, and which of the ancient sources offered the “correct” historical information are not made independently of one another but instead mutually prop each other up. It is, therefore, no coincidence that at the end of the eighteenth century Luigi Lanzi identified the Etruscan language as Italian Etruscan and as such as an Indo-European language; this conviction remained dominant in one form or another until well into the late nineteenth century.³⁴

The discovery of the famous inscription on the island of Lemnos in the northern Aegean in 1885 changed the direction of the debate. The language used in this short inscription has some similarity with Etruscan.³⁵ This paved the way for the debate over whether Etruscan was, in fact, an Indo-European language or whether it belonged to an older substrate from the Mediterranean region.³⁶ The latter possibility opened the doorway to interpreting the growing external influences on the Etruscans purely as a secondary phenomenon.

Since the interpretation of archaeological findings largely depended on the evaluation of the Etruscan language, this new situation fundamentally changed the archaeological debate as well. For example, Ugo Antonielli claimed that the inhumations of the Tyrsenian Copper and Bronze Age were representative of the indigenous (Etruscan) population. A people accustomed

to cremation burials who migrated from the north to the south, superseded this tradition, thus forming the Villanovan culture. This line of argument aimed at identifying an autochthonous and autonomous Etruscan people and can thus be deemed the scientific continuation of *Etruscheria*. Once again, it is no coincidence that at specifically this point in time, much energy and conviction were invested in advocating the autonomy of Etruscan (and Italic) Art as opposed to Greek Art, along with the originality of all things Etruscan.³⁷ This was linguistically supported, among others, by Giacomo Devoto's thesis³⁸ that the Etruscans had formed an ethnic pocket much like the Basques. He claimed that the pre-Indo-Germanic substrates had been influenced only on the "periphery" by the languages of the Indo-Germanic invaders; the contact between the indigenous population and the immigrant Indo-Germanic people had, however, led to the creation of the Etruscan culture as a *koine* of high quality.

The academic standpoints were developed against the backdrop of serious political upheaval in Italy in the 1920s and 1930s. Fascist policies aimed, among other things, at establishing strong state institutions throughout Italy, and were accompanied ideologically by the use of symbols from the Roman state. To eradicate the contrast between the Etruscans and the Romans, the Etruscan influence on the Romans was emphasized and the latter were presented not as the conquerors but as the unifiers of Italy.³⁹ An indirect repercussion of this argument, which was felt until quite recently, is reflected in the earlier view represented by Eduard Meyer and Julius Beloch—that the Etruscans native to Italy had spread from the west to the east as pirates in the Mediterranean; they were said to have settled on the island of Lemnos in the process.⁴⁰

2.2 The European colonial view of the South

In the nineteenth century, scientific archaeological research of the Mediterranean region became part of the national and colonial cultural policy of the European powers.⁴¹ The idea that the Etruscans had traveled from the north to Etruria forms part of the view that the ancient cultures were the precursors to the nations of Europe. The interests of Britain were more strongly focused on Greece and Crete, Egypt and the Near East. This would explain why British scholars were barely involved in researching the Etruscans although the idea of *Etruscheria* also met with a positive response in England.⁴² A very different picture can be painted with regard to the involvement and influence of German scholars in Italy. Not only did a large number of them live in Italy during the nineteenth and twentieth centuries, but their interest lay not only in Roman history but also explicitly in Etruscan history.⁴³

Although Nicolas Fréret⁴⁴ was the first scholar to entertain the idea that the

Etruscans had originated from the north, Barthold Georg Niebuhr was without a doubt the main proponent of the concept in the nineteenth century. He believed that the Etruscans came from the Alps, and argued that if the Gauls had first driven them there, the Alps must have been uninhabited previously. In contrast to “the Italian scholars” and as a direct attack on Micali,⁴⁵ Niebuhr claims that the tongue of the Etruscans is an uncorrupted ethnic language, elements of which can be identified in the “tongue spoken by the inhabitants of Val Gardena in Tyrol”.⁴⁶ He purports that Raetia is the “original fatherland of the Etruscan people.”⁴⁷

Scholars arguing in this vein refer to Dionysius of Halicarnassus. He is used to argue against Herodotus and all other assertions that the Etruscans originated from the East. The analogy between the name Rasenna and the Etruscans or Tyrsenians is cast an important role; equally, the link between Rasenna and the Raeti as suggested by Livy is also considered plausible.

Toward the end of the nineteenth century, archaeologist Wolfgang Helbig supported attempts to identify the Etruscans with the Raeti on the basis of archaeological arguments.⁴⁸ He linked Pliny the Elder’s comment that the Etruscans had destroyed three hundred cities with the end of the “pile villages,” the annihilation of which he claimed had been caused by the migrating Etruscans. He continued that their culture and archaeology were initially identical to the Italics and that they were not exposed to any “eastern influences.” Moreover, they then went on to rule as a “military and priestly nobility over an Italic population,” increasingly rising above them as a result of their higher “national” culture. To this, Luigi Pigorini added an argument that had a significant impact⁴⁹. He claimed that the members of the Terramare culture had migrated south over the Alps together with the Etruscans; he also asserted that the cremation of the dead and their burial in urns was characteristic for the former, whilst the latter preferred inhumation.

The fact that Helbig interprets the meeting of peoples as the superimposition of one over the other apparently stems from the thinking of the time, which was greatly influenced by European imperialism. The German scholars generally shared the view that it was chiefly the “Indo-Germanic” (not “Indo-European”) people who migrated south in more or less large numbers, subjugating the indigenous population and forming an elite.⁵⁰ They claimed that the Etruscans’ rise to become the culturally leading people in Italy stemmed from the arrival of this new noble group.

The strong link between the academic statements regarding the origins of the Etruscans and the ideological and political trends of the day was reflected in the 1920s and 1930s in the fact that the equation “Etruscan = Indo-European” found prominent supporters in Italy as well.⁵¹ In Germany from 1925 onwards, the highly influential linguist Paul Kretschmer started claiming—in contrast to his earlier ideas—that a group speaking Pelasgian and/or Raeto-Tyrsenian had migrated south from the region between the Danube and the Balkans, which group in his view also “völkisch-sprachlich” (“ethno-

linguistically”) included the Etruscans.⁵² In Italy this thinking was supported by Alfredo Trombetti and Giulio Buonamici, as well as Luigi Pareti.⁵³ A previous (“proto-Latin”) wave of “Indo-Germanic” immigrants, the so-called “Eastern Italics” in the Eneolithic period, was followed by more recent “Indo-Germanic” migrants, the Sabellians and the Umbrians of the Proto-Villanovan period, who practiced inhumation. The core of the Etruscans was represented by the proponents of the Villanova culture. Kretschmer deduces this from the Terramare culture of northern Italy.⁵⁴ Similar statements by Friedrich Matz move into a clearly Nazi context.⁵⁵ The concept of the migration of Indo-Germanic peoples from the north was still propagated by German researchers even after 1945, taking the form of the expansion of the Indo-Germanic Illyrians.⁵⁶ It was not until German pre-historians starting reflecting on their history that this idea finally disappeared from academic works.

The extent to which this view was misled by prejudice is illustrated by the completely different way in which the same archaeological material was interpreted by Gaetano de Sanctis. The cremators were said to be the Etruscans from the north; the Italics originated from the Eneolithic Period.⁵⁷

Recently, the linguist Frederik Woudhuizen picked up the notion of peoples migrating from the north. He presupposes the equation of language and people, which allows him to distinguish three layers “in the process of Indo-Europeanization of Tuscany.” But his argument does not take notice of the methodological developments in historical research.⁵⁸

2.3 The higher culture in the East

It was not until the inscription of Lemnos became well known and the significance of the eastern influences on Etruscan Art were recognized that Herodotus, Hellanicus and Thucydides were cited as relevant sources. Indeed, it was not until the Italics were seen as the common ground for the Italian nation, following the unification of Italy, that the autonomy and originality of the Etruscans, which had been so strongly emphasized in the past, finally lost its dominance. Among Italian scholars, in 1885 Edoardo Brizio explained the eastward migration of the Etruscans by claiming that Etruscan invaders of Tuscany and Emilia had brought a Orientalizing and subsequently “Grecizing” culture from the East, which was further developed than that of the Indo-European, Umbrian cremators of the Villanovan culture.⁵⁹

The German archaeologist Gustav Körte—who had previously supported the hypothesis that the Etruscans had migrated from the north—fundamentally agreed with this view.⁶⁰ With respect to the Orientalizing phase of Etruscan development, he dated the migration of the Etruscans back to the eighth century BCE. He too, saw a meeting of two peoples as one superimposing itself upon another. He asserts that a small number of Tyrsenian conquerors subjugated the Italic population, and both merged together, giving rise to the

Etruscan “nation.” With the help of the Turusha named in the lists of conquered enemies of the Egyptian pharaohs Merenptah and Ramesses III, Körte determines the origins of the invaders as “northern peoples” from the islands in the Aegean, “ancestors of the Tyrsenians,” and pirates.⁶¹

Fritz Schachermeyr was also kin to this tradition. He spoke openly of a “mission of Indo-Germanism.”⁶² Like Kretschmer, he believed that the “Indo-Germanic race” had already spread to the Aegean in the Neolithic period. He explains the affinity of the inscription of Lemnos with the Etruscan language by asserting that they had come from the same roots (a pristine people or a linguistic substrate thereof, i.e. an early Indo-Germanic Aegean language), linking this in with his highly suspect “Cultural Morphology.” He claims that between 1600 and 1200 BCE the Etruscan people in western Asia Minor had lived outside the rule of the Hittites and the Achaeans; around 1200, in the course of the postulated Aegean migration, they fell to the lower cultural level of the Greeks—which triggered the first partial Etruscan migration and the establishment of colonies along the coast of Etruria. He continues that the Etruscans became a seafaring people in the Aegean, establishing outposts on Lemnos, Lesbos and in Caria to secure their trade routes. Around 800, a second wave of migration took place, leading to the occupation of the Etrurian coast. He attempts to substantiate these highly speculative constructions by referring to the myth of Telephus.⁶³

Even though the idea gradually emerged in the 1920s and 1930s that the Etruscans had migrated to Italy from the East,⁶⁴ the route of the migration was interpreted in many different ways and was colored by national traditions of thought. Accordingly, A^oke A^okerstro^om states that the Villanova Culture was very reluctant to welcome strangers or anything new. He places the home of the Etruscans in the region between the Syrian coast, Cyprus and Rhodes, and sees the reason for migration in the expanding Neo-Assyrian rulers’ need for metals.⁶⁵ Léon Homo holds a very different view, identifying eastern features in almost all areas of Etruscan civilization; between 1200 and 1000 some Etruscans fled from the invasion of the Dorians—similar to the Normans—with a small number of them reaching the east coast of Italy.⁶⁶ Gösta Säfllund, on the other hand, asserts that two waves of migration took place in the first millennium, during the second of which migrants from Lemnos and Imbros arrived at Etruria;⁶⁷ Edmond Pottier believes that the Tyrsenians (Etruscans), as described by Hellanicus, crossed the Adriatic Sea, whereas Ambros Pfiffig claims that the migrants from the East were members of an urban culture in the Near East—a hypothesis first introduced by André Piganiol.⁶⁸ Without any indication that a critical view had been taken of the ancient narratives, Robert Beekes recently collated all evidence supporting a migration from the east.⁶⁹ Adriano La Regina states that a connection with Lydia must have existed; Mario Torelli imagines that Tyrsenian “prospectors” from the Aegean landed at the turn of the second to the first millennium on the Italic peninsula in their search for metals and formed a nucleus there, which gave rise to the

Etruscan people.⁷⁰

As early as the 1950s, Raymond Bloch claimed that the ancient tradition of Herodotus with regard to the Etruscans' origins in Asia Minor had been confirmed by modern research.⁷¹ However, not long after, Jacques Heurgon claimed that resistance to the hypothesis of their eastern origins was gaining strength due to the lack of archaeological evidence to suggest the migration of a people in the first millennium.⁷² In 2010, Jean-Marc Irollo noted: "No one today believes in the sudden arrival in central Italy of a people from the Orient" [Aujuord'hui plus personne ne croit en l'arrivée subite en Italie centrale d'un peuple venu d'Orient.]⁷³

2.4 The formation of the Etruscans replaces Etruscheria

At the end of the nineteenth century, Johann Gustav Cuno assumed that the mixing of the Etruscans from the north with the indigenous population had resulted in a new culture.⁷⁴ If in this mix the indigenous traditions are given credit for the emergence of a higher level of culture, it becomes easier to marry the concept of migration with the idea of *Etruscheria*. This is exactly what Jean Bérard did when he postulated migration from the East. The arrival of Tyrsenian Pelasgians in Italy into the late Bronze Age⁷⁵ triggered an (Etruscan) renaissance of the Tyrsenian tradition which went back as far as prehistoric times and had been violated by Indo-Germanic groups. In more recent times, Jean-Paul Thuillier, for example, has followed this line of thought in one important respect by again equating the Villanovan culture with the Etruscan culture.⁷⁶

The Renaissance and Risorgimento are strikingly close together—both aim to achieve unity once more. The impact of the Fascist state on the unity of Italy is reflected in the names chosen for the country's academic institutions. The Istituto di Studi Etruschi ed Italici, founded in 1927, clearly indicates the political intention as does the Centro di Studio del Consiglio Nazionale delle Ricerche per l'Archeologia etrusco-italica, after known as the Istituto per l'Archeologia Etrusco-Italica and now as the Istituto di Studi sul Mediterraneo Antico.⁷⁷ At the same time, academic contributions reflected the idea that the "Italic" elements were blended, and that none of them dominated. Potential external influences could do nothing to change this. This thinking was established by a series of mainly Italian scholars such as Pericle Ducati and Bartolomeo Nogara, but also scholars such as Marcel Renard and Fritz Altheim.⁷⁸ Based on the number and quality of publications that appeared in this vein, Massimo Pallottino clearly stands out.⁷⁹

Pallottino does not follow any of the ancient sources directly but selects those elements that support his ideas of the Etruscans. He claims, for example,

that the link Herodotus made between the Tyrsenians and the Pelasgians (Hdt. 1.57) was based on the memory of an old linguistic connection between pre-Hellenic peoples that was predominant in the period following the Trojan War.⁸⁰ However, he states that the toponymic arguments do not allow for any reliable conclusions about the Pelasgians who spread to the west; the argument based on the seafaring peoples was, he continues, problematic because the Turusha may have come from the West. The inscription of Lemnos does not support the immigration theory because it could simply be two dialects of the same language.⁸¹ The archaeological findings do not provide any evidence for a wave of migration from the east nor from the north. The distinction between inhumation and cremation cannot be used to identify ethnicity (autochthonous Tyrsenians who practiced inhumation and Indo-Europeans who preferred cremation). The Villanovan culture cannot be equated with that of the Umbrians, the comparison of the name Rasenna with the Raeti is no more than a dalliance. Pallottino continues that Ephorus had proven that the Greeks did not dare to venture into the western Mediterranean in the eighth and seventh centuries for fear of encountering the Tyrsenians. Moreover, the objects from the Orient found in Etruria did not come from the same area as that ascribed to the Tyrsenian immigrants. As a result, the term “Etruscans” should be limited to the historical and verifiable reality of the “nation” between the eighth and the first centuries BCE—the Etruscans became a people through a process of formation. The decisive impetus was provided by the impression that the “malleable cultures beyond the sea had made upon the still rather primitive and malleable soul of the early Etruscans” at the beginning of the Villanovan culture. He concludes that this “ferment” had been firmly planted in the intellectual thinking of the nation.⁸²

By propagating this argument, which was impossible to separate from the political developments in Italy after the 1920s, Pallottino eradicated the main weakness inherent in *Etruscheria*. He permitted influences of many kinds and was at the same time able to present an image of a self-determining group, despite his decision to qualify his definition of “people.”⁸³

By contrast, Luciana Aigner Foresti points out that it remains unclear what form this postulated “ferment” took and the impact it had; it opens up the possibility that the historical “Etruscan” culture was formed through a language switch within a small region in Italy and within a short space of time. By drawing the conclusion that the Etruscans emerged before the tenth century from a mixture of Italic-Umbrian-speaking indigenous tribes and a group of people living in the north Aegean, she approaches once more the position held by Pallottino.⁸⁴

3From the narrative to the unavoidable formation of a model

Shortly after World War II, a congress financed by the CIBA Foundation discussed whether genetic characteristics could be used to answer the question of autochthony and migration on the basis of examining blood types.⁸⁵ The euphoria this triggered once again reflected the common pattern of selectively confirming one's own expectations, as is illustrated, among others, by Jacques Hurgon, who saw the "birth and rebirth of Italy" in "the same cradle," i.e. in Etruria, thus confirmed.⁸⁶ In the past two decades, the possibility of indigenous continuity and migration from the East has been examined with the help of DNA tests, which has caught the media's attention because the link to the East was set in the context of Turkey hoping to present itself as the root of European culture. John Ward-Perkins has already spoken out against simplifications arising from such attempts.⁸⁷ The problems inherent in such undertakings (e.g. problematic samples, references to ancient written sources as a basis for making evaluations, and only partially received archaeological positions) have been discussed in detail by Phil Perkins,⁸⁸ who makes the important point that the "Pallottino consensus" assumes the existence of an "Etruscan people" even though the "formation of the Etruscans" is equated with an ethnogenesis.

Where it has been possible to analyze ethnogeneses in well known historical contexts, the findings leave no room for ambiguity: an *ethnos*, or people, is not a biological unit, it is always an intellectual construct, which receives its credibility and legitimization through a "beginning" projected to a point in the past.⁸⁹ These constructs comprise conscious leaps of the imagination; they operate with inventions and are, above all, steered by intentions that largely depend on the interests at stake at any given time.⁹⁰

In the Greek context, the name of the fictitious founder of the Tyrsenian people was derived from the name of the people. This served to provide a more or less vague label for the initially little known West. As geographical awareness increased, the name gained more meaning; even so, it was always defined far more by intertextual contexts than by concrete historical and geographical knowledge. The name of the Tusci has a similar quality; it is a name—with perhaps Umbrian roots—which was used to refer, from the Roman point of view, to a foreign, loosely specified or non-specifiable group of populations and settlements north (and south) of Latium. Dionysius of Halicarnassus contrasted the two names with the other name Rasenna; however, his claim that the designation was chosen by the group to refer to itself, postulates the notion of an Etruscan people and thus proves to be of secondary importance.⁹¹

The second imagined area is that of the Etruscan language. To date, it has not been possible to define its characteristics with any degree of clarity. The assumption that it was some kind of "Aegean" substrate requires the evolutionary tree theory—stemming from the ideas of the Romantic period—to see in this substrate the common ground for the Etruscan language and that of the inscription of Lemnos. This is diametrically opposed to the possibility

of a language switch and the call in linguistics to define the structure of the Etruscan language on the basis of existing Etruscan texts. This possibility demonstrates just how unconvincing the imagined firm link between language and people actually is when it is treated as an historical reality.

The third field in which imagination, inventions and interests play a central role is archaeology. To avoid the interferences between the ancient written sources, the hypotheses regarding the Etruscan language and the interpretations of archaeological findings that lead to the circular reasoning so frequent in academic debates, it is necessary to follow the fundamental call in the methodological debate in archaeology to contextualize and interpret archaeological findings initially on their own.⁹² The explicit formation of models widely discussed in the methodological debate amongst archaeologists thus serves as a foundation. The archaeological settings, local and trans-regional correlations between findings can only be given meaning in a scientifically transparent manner, where specifically defined and clearly described analogical cases from the fields of anthropology and history are used. This, in fact, forms the basis for the more recent reflections on the possible internal structures of the settlements and cities and the connections between them.⁹³ These reflections become all the more compelling, the less they depend upon the alleged knowledge of the “Etruscans” in the ancient written sources.

3The Etruscans in Ancient Literature

Abstract: Our overview of the ancient literary sources about the Etruscans is less than satisfying. Although some attempts at covering single thematic fields as well as certain literary genres have been made, the only pioneering collection is incomplete.

It is possible to review the ancient terminology for Etruscans, Etruscan and the like, give an overview of the most important authors and texts and finally try to characterize the ancient literary evidence as a whole, pointing out its limitations and assessing the value it nonetheless has.

Keywords: Greek sources, Latin sources, Greek literature, Latin literature

Introduction

Our overview of the ancient literary sources about the Etruscans is less than satisfying. Although some attempts at covering single thematic fields⁹⁴ as well as certain literary genres⁹⁵ have been made, the only collection that aims at comprehensiveness is Giulio Buonamici's *Fonti di storia etrusca*.⁹⁶ Although one has to be grateful for his pioneering effort, his corpus is incomplete, ill-organized, lacks any commentary and presents the texts only in Italian translation, sometimes of dubious quality; that the page numbers in the index often lead astray does not help either. However, there are good grounds for hope, as a project entitled *FaREP (Fontes ad Res Etruscas Pertinentes)*, directed by Giovanni Colonna and executed chiefly by Daniele F. Maras, Laura M. Michetti and Elena Tassi Scandone, is underway at La Sapienza in Rome. Within a few years, it will hopefully result in a collection of sources that can replace Buonamici's.

The short survey that follows falls into three parts: It will start with a brief review of the ancient terminology for "Etruscans," "Etruscan" and the like. After this, an overview of the most important authors and texts shall be given. Finally, I will try to characterize the ancient literary evidence as a whole, pointing out its limitations and assessing the value it nonetheless has.

This article has profited from the generous help of Petra Amann, Daniele F. Maras, Simona Marchesini and Alessandro Naso. My heartfelt thanks to all of them.

1 Terminology and Semantics

The oldest Greek sources that can be related to the Etruscans call them Τυρσηνοί or (doric) Τυρσανοί. The Attic form Τυρρηνοί, due to progressive assimilation ρσ > ρρ, is first found in Old Comedy. It becomes the most common term in later times. The adjective, Τυρρηνικός, and the name of the country, Τυρρηνία, are deduced from the ethnicon in a regular manner. These terms are often taken over into Latin as *Tyrrheni*, *Tyrrhenicus*, *Tyrrhenia*. The most common Latin expressions for the people and the country, however, are *Tusci*, *Etrusci* (both subst. and adj.) and *Etruria*.

The etymological significance of these denominations is unknown. They may be of non-Etruscan origin, since the Etruscans seem to have called themselves *ras(en)na*, as testified by a number of inscriptions and Dionysius of Halicarnassus (*Ant. Rom.* 1.30.3).⁹⁷ The only thing we can be reasonably sure of is that all Greek and Latin appellations are cognate among each other and derived from a stem *turs-*/ *trus-*, to which Umbrian *turskus* also belongs.⁹⁸

The Greeks and Romans themselves compensated for this lack of knowledge by a number of speculative etymologies that are patently false but can give some first clues to their view of the people: For example, Τυρρηνοί was derived ?π? το? θύειν, from sacrificing (Serv. *Aen.* 8.270), since the Etruscans were thought to be extremely religious, and from τύρσις, the towers in which they were supposed to live (Dion. Hal. *Ant. Rom.* 1.30.2). In turn, τύραννος was deduced from Τυρρηνοί on account of their supposed cruelty.⁹⁹

One may doubt whether the first writers to mention Τυρσηνοί had a clear idea of the identity of the people they called by this name. Hesiod or rather a continuator of his *Theogony*¹⁰⁰ knows them as Italians but seems unable to distinguish between them and other inhabitants of the peninsula (*Theog.* 1011–16).¹⁰¹ The author of the *Hymn to Bacchus* (6th or 5th century BCE?) sees them only as pirates and makes no attempt at locating them at all (*Hymn. Bacch.* 7–8).¹⁰² Sophocles (497–406 BCE) speaks

of “Pelasgian Tyrsenians” (Dion. Hal. *Ant. Rom.* 1.25.2 = *TGrF* 4 fr. 270), and the idea that Τυρσηνοί is a synonym for Πελασγοί was widespread in early times, as Dionysius explains *ad locum*.¹⁰³ Hecataeus (c. 550–490 BCE), however, already knows Elba as an “island of the Τυρσηνοί” (Steph. Byz. s.v. ??θάλη = *FGrH* 1 F 59), while Pindar (*Pyth.* 1.71–75) mentions Τυρσανοί in a truly historical context when he celebrates the victory of Hieron I over them in the battle of Cumae in 474 BCE. From the late 5th century BCE onwards, most references to Τυρρηνοί in Greek and later to *Tusci* and *Etrusci* in Latin sources clearly bear on Etruscans in our sense, that is, on the inhabitants of modern Tuscany as well as of the colonized regions in the Campania and the Po valley.¹⁰⁴ Harmony is not complete, though, as a number of sources continue to mention Τυρρηνοί in the Aegean.¹⁰⁵

2The Literary Sources

The Etruscans kindled great interest in the Greeks and Romans, especially in the latter. There are few “barbarian” peoples (Jews, Egyptians and possibly Carthaginians spring to mind) about whom so much was written in antiquity. The following, roughly chronological overview will thus necessarily be very selective. From the more than 180 authors in Buonamici’s collection—not exhaustive itself, as mentioned before—only a small fraction can be named and discussed.

Until the 5th century BCE, no writer seems to have engaged systematically with the Etruscans. References to them, some of which have been mentioned above, are few and far between. They appear casually and concern single details of their history, customs and the like; for example, most relevant passages in Greek tragedy just speak in passing of the “Etruscan trumpet” (Aesch. *Eum.* 567–68; Eur. *Rhes.* 988–89, *Phoen.* 1377–78, *Heracl.* 830–31). If Etruscans are mentioned in comedy, they are often associated with certain luxury goods (Poll. *Onom.* 7.86 = Cratinus, *PCG* fr. 139 σανδάλια Τυρρηνικά, “Etruscan sandals”; Ath. 15.700c = Pherecrates, *PCG* fr. 90).¹⁰⁶

This changed when Greek historiography came into its own in the course of the 5th century BCE. As many of the first historians wrote universal history, it is understandable that the Etruscans, too, caught their eye. Pride of place is due to Herodotus (c. 490–420 BCE): his narration of how half of the Lydians under their leader Tyrsenus, son of king Atys, emigrated to the land of the Umbrians because of a long-standing famine (Hdt. 1.94) was repeated by many ancient writers and initiated the notorious discussion about the origin of the Etruscans that still is not definitively settled today.¹⁰⁷ His account of the sea battle of Alalia in 540 BCE, where Etruscans and Phoenicians fought the Phoceans residing there (Hdt. 1.166–67), is another important piece of information. Besides Herodotus, a number of contemporary or somewhat younger historians also wrote about the Etruscans: Hellanicus of Lesbos (c. 480–395 BCE) thinks them Pelasgians who in ancient times emigrated from the Aegean to their present dwelling places (*FGrH* 4 F 4), but also says that some of them still live on Lesbos (and Lemnos?) in his own day (*FGrH* 4 F 71c, F 92). Thucydides (c. 460–395 BCE) mainly focuses on military history, informing us about the Etruscan collaboration with Athens during the Sicilian expedition (Thuc. 6.88, 6.103, 7.53–54).¹⁰⁸ Ephorus (c. 405–330 BCE) knows the Etruscans as dangerous pirates who infested Sicily since the 8th century BCE at the latest (Strabo 6.2.2 = *FGrH* 70 F 137a).¹⁰⁹ Theopompus (c.378–320 BCE) is extensively quoted by Athenaeus on the libertine morals of the people (Ath. 12.517d–518b = *FGrH* 115 F 204).¹¹⁰ He also attempts, as Hesiodus had done before him, to integrate them in the framework of Greek myth, naming Cortona as the death place of Odysseus (schol. Lycoph. *Alex.* 806 = *FGrH* 115 F 354).

Historiographic interest in the Etruscans seamlessly continued into the

Hellenistic era. An early and particularly arresting testimony comes from the Attidographer Philochorus (died 261 BCE), who continues the “Aegean” tradition; he has the Etruscans first reside in Athens itself, then emigrate to Lemnos and Imbros in the wake of conflicts with the Athenians, and finally carry off some Attic girls while they are celebrating the Brauronia (schol. Lucian *Catapl.* 25 = *FGrH* 328 F 100). This seems to be quite closely related to a contribution of Anticlides of Athens (living after Alexander) who calls the Etruscans Pelasgians who emigrated to Italy, while others settled on Lemnos and Imbros (Strabo 5.2.4 = *FGrH* 140 F 21).¹¹¹ Timaeus (c. 345–250 BCE) once more attributes loose morals to the people, as he asserts that their slave girls have to attend them naked (Ath. 4.153d and 12.517d = *FGrH* 566 F 1). He also exemplifies a further way of linking Etruria to the Greek mythographical tradition, namely through the journey of the Argonauts (Diod. Sic. 4.56.3 = *FGrH* 566 F 85).

The tendency to draw the Etruscans into the orbit of Greek myth is also shared by the Hellenistic poet Lycophron (c. 320–after 280 BCE) who has Odysseus and Aeneas meet Tarchon and Tyrrhenus at Cortona (*Alex.* 1238–49), where he also locates the former’s grave in the wake of Theopompus (*Alex.* 805–806). In addition, he provides us with a reading of the alleged immigration from Lydia that Herodotus himself would have liked, contextualizing it as one episode of an ongoing east-west conflict (*Alex.* 1351–61).¹¹²

Between the Late Classical period and early Hellenism, Etruscan customs also began to arouse the ethnographic interest of Academics and Peripatetics. Aristotle (384–322 BCE) is informed about concrete aspects of Etruscan politics such as a commercial treaty between them and Carthage (*Pol.* 3.5.10–11). Some fragments from his dialogues and Τυρρηνῶν νόμιμα (forming part of his ὁμίμα βαρβαρικά) speak of the cruelty of the Etruscans, their predilection for aulos music and their permissive manners (fr. 60, 607, 608 Rose). As far as the last point is concerned, Heraclides Ponticus (c. 390–310 BCE) follows suit (fr. 611.44 Rose).

The most important development of the Hellenistic era in the present context was the rise of Roman literature, which had a special interest in things Etruscan: Since the late third century BCE, the authors who tell us something about the people mainly are either Romans or Greeks closely associated with Rome. At the beginning, most of them are historians, as in the Greek world. The first fragments come from Fabius Pictor (fl.c. 200 BCE), who mentions the Etruscan contribution to early Roman history in his account of the latter (*FRH* 1 F 12, 15–17). He is followed by Cato the Elder (c.234–149 BCE), who in his *Origines* talks, inter alia, about the former Etruscan predominance in Italy (Serv. *Aen.* 11.567 = *FRH* 3 F 1.13). A couple of decades later, Polybius (c.200–120 BCE) shows himself to be well informed, as he knows not only, unsurprisingly, how the Etruscans were subdued by the Romans (Polyb. 1.6.4–6) but also that their settlement areas were larger before his own

time, including the Po valley and Campania (Polyb. 2.17.1–3). An important fragment (*FGrH* 87 F 119 = Diod. Sic. 5.40) has come down to us from Posidonius (c. 135–51 BCE):¹¹³ He stresses the earlier bravery and inventiveness of the people but maintains that they have now been seduced by the fertility of their country, succumbed to luxury and decadence and therefore lost their ancient power. Diodorus Siculus (first century BCE), who transmits this piece, is the next author to present us with extensive remarks on Etruscan history (thalassocracy, loss of the Po valley) and culture (piracy, haruspicy, influence on Rome); he mainly bases his text on earlier Hellenistic historiography, but also makes use of contemporary discussions.¹¹⁴ Even more information is provided by Dionysius of Halicarnassus and Livy. The former, among numerous other remarks (e.g. his narrative about the attack of the Etruscans and other peoples on Cumae in 524 BCE, *Ant. Rom.* 7.2–3), devotes a section of his prehistory of Italy to the Etruscans. He rejects the Herodotean story of a Lydian origin (relying especially on Xanthus of Lydia who never had heard about it) as well as any other kind of immigration thesis and as the first extant author considers the people as autochthonous in its present area of settlement (*Ant. Rom.* 1.26–30).¹¹⁵ In Livy's first books, which treat the beginnings of Rome and the Roman Kingdom, the Etruscans are almost omnipresent. Later on, in the Early Republic, the subjugation of Etruria, beginning with Veii, is an important issue.¹¹⁶

Besides the historians, antiquarians and subject-specific writers come now to the foreground. The polyhistor Varro (c. 116–27 BCE) shows a keen interest in many aspects of Etruscan culture, especially in agriculture and religion, and in its influence on Rome as reflected in Etruscan toponyms, personal names and other words. Some of his notes are of considerable importance for Roman cultural history (e.g., *Ling.* 5.8: Mons Caelius named after the Etruscan leader Caele Vibenna, now epigraphically attested; *Ling.* 5.32: foundations of cities in Latium *Etrusco ritu*).¹¹⁷ The geographer Strabo (c. 63 BCE–after 23 CE) gives a concise overview of Etruria, including not only its physical geography and settlements, but also, on occasion, its economy and history (Strabo 5.2.2–9).¹¹⁸ Cicero is the first representative, as well as one of the most informative, of the long-lasting interest in Etruscan religion and its contribution to Roman religion, especially in divination, which he discusses in detail in *De natura deorum* and above all in *De divinatione*.¹¹⁹ Vitruvius's *De architectura* informs us about Etruscan traces in the Roman building tradition such as principles of city planning (*De arch.* 1.7.1–2), the Tuscan order in temple building (*De arch.* 4.6.6–4.7.5) or the Tuscan *atrium* (*De arch.* 6.3.1).¹²⁰ The work is our most important literary source by far on this aspect of Etruscan civilization.

Numerous remarks on Etruria and the Etruscans are scattered rather casually throughout the works of Augustan poets such as Virgil, Horace, Propertius and Ovid.¹²¹ Important passages include the self-presentation of the Etruscan god Voltumna/Vertumnus in Propertius 4.2, and above all the

second half of the *Aeneid*, in which Aeneas and the Trojans are presented as descendants of the Etruscans, and the cities of Etruria are viewed with obvious sympathy by the narrator and play a major role in the fight for Latium.¹²² Virgil draws extensively on mythological and antiquarian lore, parts of which are preserved by his ancient commentators, especially Servius (late fourth century CE).

The end of the Republic and the following decades also witnessed the only examples of ancient Etruscological monographs we know of. At least two books of *Τοπικα* are attested for Sostratus of Nysa¹²³ (first half of first century BCE). The only fragment preserved (Stob. *Flor.* 4.20.72 = *FGrH* 23 F 3) is mythographic. The famous grammarian and antiquarian Verrius Flaccus (c. 55 BCE–20 CE) wrote *Rerum Etruscarum libri* according to the *Scholia Veronensia* on Verg. *Aen.* 10.183 and 10.200. Finally, the emperor Claudius (10 BCE–54 CE) left no less than twenty books under the same title, according to Suetonius (*Claud.* 42). One interesting piece of information that probably figured there was also incorporated in a speech Claudius held at Lyon (*CIL* XIII 1668.16–25); it concerns Servius Tullius who allegedly came to Rome as a *sodalis* of Caele Vibenna under his Etruscan name, Mastarna.¹²⁴

With Claudius, we have reached the post-Augustan era. By now, the Etruscan civilization is virtually extinct and our sources therefore become more and more derivative. Genres proceeding by way of excerption from older sources come to the foreground: antiquarian literature, encyclopedic writing, lexicography and so on. This is confirmed ex negativo by a short look at historiography and poetry: little of importance that we would not know from older sources comes from Velleius Paterculus (c. 20 BCE–after 31 CE), Tacitus (c. 55–120 CE), Florus (second century CE) and the abridged version of Pompeius Trogus by Justinus (second / third century CE?). It appears significant that the most interesting remark from one of these authors concerns the imminent loss of Etruscan traditions under the early Principate and once more involves Claudius, who has the Roman senate decree measures to prevent the extinction of haruspicy (Tac. *Ann.* 11.15).¹²⁵ The *exempla* collection of Valerius Maximus (writing under Tiberius) is not more useful, with the possible exception of Val. Max. 1.1.1 in which the author explains how the Romans used to send some of their children to Etruria in the old times to let them learn the *Etrusca disciplina* there.¹²⁶ Poets such as Lucan (39–65 CE), Silius Italicus (c. 25–100 CE), Statius (c. 40–96 CE), Martial (c. 40–102 CE) and Juvenal (c. 60–after 127 CE) do not contribute much more than well-known commonplaces.¹²⁷

Authors concerned with specific disciplines of knowledge are somewhat more helpful. The *Quaestiones naturales* of Seneca the Younger (c. 4 CE–65 CE) contain some interesting notes on Etruscan ceraunoscopy, especially on the classification of thunderbolts (*Q. Nat.* 2.32.2, 2.39–41).¹²⁸ Pausanias (second century CE) gives us a precious piece of information about relations between Etruria and Greece in the Archaic period when he tells us that the

Etruscan king Arimnestus was the first of the barbarians to donate a votive offering at Olympia (Paus. 5.12.5). Tertullian (c. 160–220 CE) is the first of a number of Christian writers who mention the religious opinions and customs of Etruria in the context of their criticism of ancient religion (cf., e.g., his list of Etruscan city deities in *Apol.* 24.8). The collection of writings by the Roman land surveyors, the *Corpus Agrimensorum Romanorum* (compiled step by step over the Imperial period), can lay claim to special attention for a number of reasons: Its texts can be used with due caution to reconstruct pre-Roman forms of land ownership in Etruria, that is an important aspect of Etruscan economy,¹²⁹ contain information about how Roman *limitatio* founded itself on the *Etrusca disciplina* (pp. 10.20–11.8, 131.3–132.5 Thulin) and feature the so-called “Prophecy of Vegoia” (vol. 1, p. 350 Lachmann). The latter may be a rare example of a Latin text going back to an Etruscan original; the prophetic nymph Vegoia seems to voice Etruscan protest against the Roman reform of land-ownership in Italy in 91 BCE.¹³⁰

It is writers with encyclopedic interests, however, who provide the amplest information during this era. The Elder Pliny (23–79 CE) has some forty notes on Etruscan geography, antiquities, cultural history, religion and *mirabilia* of all sorts; for part of this material, he is our only or at least our oldest extant source.¹³¹ Plutarch (c. 45–125 CE) is greatly interested in the Etruscan involvement in Roman prehistory as well as in Etruscan history and cultural history itself. Among other things, he comments on Etruscan wanderings in the Aegean, Laconia, and Crete (*Quaest. Graec.* 21), an oracle of Tethys in Etruria (*Rom.* 18) and Pythagoras as an Etruscan (*Quaest. conv.* 8.7.1).¹³² In *De verborum significatu*, a second century CE extract by Sextus Pompeius Festus of a lost treatise by Verrius Flaccus, and in the secondary abridgement of Festus by Paul the Deacon (c. 725–799 CE), some twenty entries provide us with information about Etruscan religion and vocabulary.¹³³ Aelianus (c. 170–after 222 CE) likes to talk about Etruscan fishing, hunting (with the help of music! *NA* 12.46) and the luxurious, decadent Etruscan lifestyle in general. Athenaeus (fl. c. 200 CE) not only transmits the above-mentioned fragment of Theopompus, but also collects a number of other remarks on cultural history and mythology from older sources, which he always cites by name. In his *De die natali* (238 CE), Censorinus reports the opinions of the Etruscans on the duration of human life and sketches their famous *saecula* doctrine, basing himself largely on Varro (*DN* 11.6, 14.6, 17.5–6).¹³⁴

Moving on to Late Antiquity, the predominance of antiquarian, encyclopedic and lexicographical writing becomes even more striking. Among authors of more specific interests, the apologist Arnobius (died c. 330 CE) sees Etruscan religion as an extreme case of pagan superstition, calling Etruria *genetrix et mater superstitionis* (*Adv. nat.* 7.26). Some of his remarks on it—for example, his remarks about the four kinds of Penates and the twelve *dei consentes et complices* of the Etruscan pantheon (*Adv. nat.* 3.40)—are quite intriguing.¹³⁵ The only historian who contributes something

remarkable is Ammianus Marcellinus (c. 330–395 CE). He, too, is exclusively interested in Etruscan religion but sees it in a more positive light, as he approvingly notes the persisting role of Etruscan haruspicy and religious books in Roman state affairs. He may have been personally familiar with some of these texts, which he cites under specific titles (e.g., Amm. Marc. 23.5.10, *libri exercitiales*).¹³⁶ Rutilius Namatianus, by contrast, paints a tableau of decay and conjures up historical reminiscences as he sails along the coast of Etruria in *De reditu suo* (416 CE).

The antiquarian interests of Macrobius (c. 385–after 430 CE) include Etruscan mythical prehistory, cultural history, language and especially religion. Of particular interest are two remarks, which he implies go back to Etruscan *ostentaria*, on the divinatory value of unusual colors of sheep and on *arbores infelices* (*Sat.* 3.7.2, 3.20.3).¹³⁷ Martianus Capella (fifth century CE) also focuses on Etruscan religion. Among the pertinent passages, an overview of the sky and its divine inhabitants (*Mart. Cap.* 1.2.45–60) stands out as a reflection of Etruscan cosmology, since the sky is divided into sixteen regions according to Etruscan practice, but the details are a bewildering mess.¹³⁸ John the Lydian (490–after 560 CE), who was attracted to the Etruscans because of his curiosity about Roman antiquities and perhaps also because of his own Lydian origin, has much to say about their cultural and religious influence on Rome (cf., e.g., the preface to *De magistratibus*). He cites old and trustworthy authors such as Varro and in *De ostentis* (*praef.* 2–3) even invokes a literary dialogue between the famous Tages, a sage, gray-haired child, who was plowed out of the soil and became the founder of Etruscan religion,¹³⁹ and the culture hero Tarchon as well as other Etruscan writings. On top of it, *De ostentis* contains a brontoscopic calendar (*Ost.* 27–38), a piece on divination from earthquakes (*Ost.* 54–58) and a weather calendar (*Ost.* 59–70), all of which John claims to go back via Roman translators (Nigidius Figulus [fr. 83 Swoboda], a Vicellius and a Claudius Tuscus respectively) to Tages and Etruscan holy literature in general. It is unclear, however, if there ever were Etruscan originals to these pieces and how much genuinely Etruscan lore they transmit.¹⁴⁰ Hesychius of Alexandria (fifth century CE?) notably contributes to our knowledge of the Etruscan lexicon. The *Ethnika* of Stephanus of Byzantium (6th century CE) contain many entries on Etruscan cities and provide some material concerning the question of Etruscan presence in the Aegean.¹⁴¹

At the dawn of the Middle Ages, the *Etymologiae* of Isidore of Seville (c. 560–636 CE) comprise some twenty entries on Etruscan subjects, but only a handful of etymologies (*Etym.* 10.159: *lanista*; 18.14: *cassis*, 18.57: *veles*)¹⁴² are not known from older sources. As late as 800 CE, the *Liber glossarum* gives eight Etruscan month names.¹⁴³ From the Byzantine Empire, the *SUDA* (10th century CE) has a number of relevant items, among which an account of a supposedly Etruscan cosmogony plus doctrine of the ages (τ 1195 Adler s.v. Τυπηνία) stands out; the creation of the world in six steps, each of which

takes a thousand years, seems however to be based on Gen 1. Zonaras (12th century CE) and Tzetzes (c. 1110–1180 CE) just repeat well-known information, with the exception of a very full narrative about a social revolution in third century BCE Volsinii (Zonar. 8.7). Finally, Eustathius (c. 1110–1195 CE) narrates a romantic love story between an Etruscan pirate and an Athenian prisoner in his commentary on Dionysius Periegetes 592.¹⁴⁴

3 Some General Remarks

Let us now briefly review the source situation as a whole and reflect on how it affects the nature of the information that has come down to us. Three points spring to mind in particular: First, with very few exceptions, ancient literature shows the Etruscans from the outside, so to speak. Second, most sources are comparatively late. Third, information is usually provided in bits and pieces.

(a) As to the first point, Etruscan literature itself, which certainly existed on religious (*libri haruspicini, fulgurales, rituales* etc.)¹⁴⁵ and historical topics,¹⁴⁶ is irretrievably lost. The same holds true for the Etruscological monographs by Sostratus, Verrius Flaccus and Claudius as well as for treatises on Etruscan religion by insiders, partly with Etruscan roots themselves, such as Aulus Caecina, Tarquinius Priscus, Nigidius Figulus, C. Fonteius Capito and Cornelius Labeo.¹⁴⁷ The extant sources, by contrast, almost invariably present us with a view from the outside. This has a number of important consequences.

Among the most fundamental of these may be counted a proneness to misunderstandings arising from cultural differences, a tendency to see the Etruscans as one uniform *ethnos*, passing over the numerous differences between the single city states that existed, and the strangeness with which the people was invested. This sense of strangeness in turn prompted ancient authors to highlight differences between Etruscan and Greco-Roman culture (emphasizing, for example, the comparable freedom Etruscan women enjoyed)¹⁴⁸ and at the same time to downplay foreign—especially Greek—influences on the Etruscans. While connections between the latter and the Greek world are sometimes reflected in myths and anecdotes, one could never guess from such hints the massive amount of Greek culture they absorbed since the 8th century BCE at the latest. The perception of Etruria as a strange world may also have kindled the debate about the people's origin, since both the immigration and the autochthony thesis can be seen as answers to the question of why they were so different from their neighbors: either because they had come from very far, or because they had lived in the same place for so long and retained their original way of life, while their environment was changing.

The label “view from the outside” must be specified, however, since it

actually means quite different things with regard to the Greeks on the one hand and the Romans on the other.¹⁴⁹ To the former, the Etruscans really were a foreign, strange people. Their view of them was predominantly negative. It was nourished mainly by ethnographic stereotypes (e.g., the *τροφή* motif) and by economic and military antagonism (e.g., the piracy topos resulting to some degree from conflicts over naval supremacy).¹⁵⁰ This does not mean, though, that the Greeks were unable to see anything positive in the Etruscans. They appreciated their highly developed material culture, recognized their inventiveness in arts and crafts and held their metalwork, clothing and *haute cuisine* in high regard.¹⁵¹

The perspective of the Romans was rather more complex. They not only had better insight into Etruscan culture because the Etruscans were their direct neighbors, but, more importantly, the Romans did not regard the Etruscans as just another foreign people, but acknowledged the fact that the Etruscans shared a part of their own early history, which led to a fundamentally ambivalent Roman attitude towards them. On the one hand, the Romans took over elements of the generally hostile Greek image of the people and displayed a certain Etruscophobia in connection with figures like Tarquinius Suberbus and events such as the wars that led to the subjugation of Etruria.¹⁵² On the other hand, they were keenly interested in Etruscan elements within their own culture and quick to acknowledge their debt to the Etruscans in many realms. This holds true, for example, for architecture, plastic art and painting, which were said to have been exclusively Etruscan under the kings (Varro in Plin. *HN* 35.15), for political symbols like the *sella curulis*, the *fascies* and the *toga praetexta*¹⁵³ and for public amusements such as gladiatorial fights and theatrical performances.¹⁵⁴ Finally, the Romans looked to the Etruscans as their masters in religious matters, on which more will be said in a moment.

(b) To the spatial and cultural distance at which the sources stand from the Etruscan civilization, a chronological removal is added. In fact, the quantity of evidence provided by ancient authors about the Etruscans stands in inverse proportion to the political and cultural vitality of the latter. Close to nothing is transmitted from the heyday of Etruscan power and prosperity in the Archaic period. Most relevant texts come from Hellenism, during which the Etruscans were already losing their political identity, and above all from the Roman Empire, by which time Etruscan culture had disappeared as a whole. This, too, in a number of ways conditions the kind and quality of information we get and the resulting image of the people.

To begin with, the belatedness of the sources means that most of our information is second-hand at best, which multiplies the possibilities for misunderstandings and distortions.

Moreover, to an author writing during the decline or after the extinction of the Etruscan civilization, the question of why it had ended so sadly occurred quite naturally. It was often answered by means of the idea, widespread and

influential in ancient historical thinking, that prosperity leads to decadence and to the loss of former greatness.¹⁵⁵ Accordingly, we are presented with a two-stage model of Etruscan character and history. In an early period, the Etruscans were brave warriors, powerful rulers of the whole of Italy¹⁵⁶ and masters of the sea (even if their thalassocracy could to some extent take the form of piracy).¹⁵⁷ Later, they lost their political and military preeminence because they were lured into decadence by their all-too-fertile country and gave themselves to a luxurious lifestyle, sumptuous banquets and licentious behavior.

Finally, the preponderance of late evidence goes some way to explain the prominence given to Etruscan religion, especially divination: On the one side, while the earlier Greek sources did not care about Etruscan religion at all, the later Roman sources maintained that Rome's most important cultural debt to Etruria concerned precisely this aspect. On the other side, since divination and other elements of Etruscan religion were integrated into the religious system of the Romans, they outlasted the vanishing of Etruscan culture as a whole for hundreds of years. As a result, the Etruscans came to appear as a people for whom religion was all-important (e.g., Livy 5.1.6), and their country was seen either as a hoard of precious knowledge about the divine or, by Christian writers, as a focal point of detestable superstition.¹⁵⁸ Until the very end of antiquity, the sources provide information about Etruscan methods of finding out the will of the gods and recognizing the course of destiny: extispicy, ceraunoscopy, interpretations of *ostenta*, the doctrine of the *saecula* and so on. "Etruscan" and especially "Tages" even became labels to be attached to any kind of divinatory literature, it seems, in the same way "Orpheus" could stand for cosmogonic poetry.¹⁵⁹ This means that we possess quite detailed information on Etruscan divination, but that it is often difficult to tell what is genuinely Etruscan, what has been modified or even created by the very act of Roman adoption and what is later falsification.

(c) The last point depends to some degree on circumstances already mentioned under the first two. As noted before, Etruscan literature itself as well as ancient Etruscography is lost. Among the transmitted evidence, historiography (with strong ethnographic interests) dominates during the Classical period and Hellenism, subject-specific writers in the Late Republic and the first decades of the Principate; after that, the most important sources are, broadly speaking, compilations of various kinds. But of the old historiographical sources, only the smaller part (Herodotus, Thucydides, Dionysius, Livy) is preserved more or less in its original form. Most of the authors in question (e.g., Theopompus, Timaeus, Fabius Pictor, Cato the Elder, Posidonius) survive only in fragments cited by writers of the last two classes, that is, subject-specific writers, antiquarians, encyclopedists, lexicographers and so on. Because such texts tend to break up their information into small units, that is the form in which it has, in most cases, reached us.

For this reason, we are ill-informed about Etruscan history in the proper sense of the word, because continuous historical narrative is precisely what can not be transmitted in atomistic form. By contrast, antiquarian knowledge lends itself naturally to such a kind of transmission, so we possess a quite substantial amount of information about various aspects of Etruscan culture from divination and religion to social order, economy, arts and crafts, food, lifestyle and language.

Furthermore, compilations are *per se* prone to copying each other. In this way, colorful bits and pieces are cited again and again and acquire a popularity that is out of proportion with their real importance. Over and over again we hear, for example, about the invention of the war-trumpet,¹⁶⁰ the cruel habit of tying the convicted to rotting corpses, or the discovery and the revelations of Tages. In this way, cultural history tends to dissolve into a collection of topoi.

It is presumably because of considerations such as these that the literary sources as a whole are sometimes thought to be less significant for our knowledge of Etruscan culture than the archeological and epigraphic material.¹⁶¹ Is this assumption correct? It certainly is with regard to the inner life of the culture. There is no denying that the monuments provide a fuller and more authentic picture in this respect. Only occasionally is their testimony nuanced or fleshed out by literary evidence.¹⁶² When it comes to the interaction between the Etruscans and their neighbors, however, the literary evidence becomes indispensable. What little we know about Etruscan contacts with Carthage, clashes with the Greeks of Southern Italy, influence on and final subjugation by Rome, we know from literary sources in the first place.¹⁶³ If, finally, the way a people is seen by its contemporaries and the afterlife of its culture in later times are also considered part of its history, in this respect the literary sources are nearly all-important.

It has rightly been stated that the archeological and the philological evidence about the Etruscans as a rule do not correspond well,¹⁶⁴ and given the above-mentioned perspective and chronological differences between them, it could hardly be otherwise. However, this fact can be seen not only as a hindrance, but also as an advantage: If the two kinds of sources seldom corroborate each other, they make good for this shortcoming by mutually complementing each other, showing us the Etruscans as they saw themselves and as they were seen by other ancient cultures respectively. In this way, we get a more graphic picture of them than we could otherwise hope for.

4History of Etruscology

Abstract: The history of the Etruscology must be told within the broader framework of the history of archaeology and—even more broadly—of culture. It should become apparent that reviewing the rediscovery of the Etruscan world may constitute a valuable opportunity for understanding the stages of the recovery of Antiquity and of the role it played in medieval, more recent, and contemporary culture. In reviewing the different stages of this event, we may further point out that over time, the techniques of research were refined, and note that it will be possible to observe the gradual adoption of methods of historical investigation. It is important, moreover, to indicate that “neutral” research, as research on the Etruscans might seem to be, is in fact often freighted with ideological weight. In sixteenth-century Tuscany, the Etruscans were seen as the precedent and the justification of Cosimo I de’ Medici’s policies, which strove to broaden the Grand Duchy’s sphere of influence. At other times and in different circumstances, the federal structure of their state was instead put in evidence, as in the decades preceding the Unification of Italy, or it was desired to credit an anti-imperialist significance to the confrontation between Etruscans and Rome.

Keywords: Etruscomania, *etruscheria*, etruscologia, history of research, history of studies

Introduction

To prevent this review of the field from becoming a sterile catalogue of more or less famous personages and more or less useful works, the story must be told within the broader framework of the history of archaeology and—even more broadly—of culture. It should become apparent that reviewing the rediscovery of the Etruscan world may constitute a valuable opportunity for understanding the stages of the recovery of Antiquity and of the role it played in medieval, more recent, and contemporary culture.

In reviewing the different stages of this event, we may further point out that over time, the techniques of research were refined, and note that it will be possible to observe the gradual adoption of methods of historical investigation.

It is important, moreover, to indicate that “neutral” research, as research on the Etruscans might seem to be, is in fact often freighted with ideological weight. In sixteenth-century Tuscany, the Etruscans were seen as the precedent and the justification of Cosimo I de’ Medici’s policies, which strove to broaden the Grand Duchy’s sphere of influence. At other times and in different circumstances, the federal structure of their state was instead put in evidence, as in the decades preceding the Unification of Italy, or it was desired

to credit an anti-imperialist significance to the confrontation between Etruscans and Rome.

1 Initial research

Traditionally, the beginning of research on the Etruscans is taken to coincide with the activity of the Dominican monk Annio da Viterbo (1432?–1502).¹⁶⁵ Born in Viterbo, Annio studied in Florence and graduated in theology, then moved to Genoa where he taught grammar and began to work in astrology, successfully composing predictions and horoscopes for a variety of influential people of his time. He returned to Viterbo, where he took an interest in local history, especially Etruscan antiquity, and published the successful *Antiquitatum variarum volumina XVII* (1498). Using sources both legitimate and not, which he edited himself, the Dominican monk suggested at first that the Etruscans were the direct descendants of Osiris and, in turn, of Noah, known in Italy as Janus by the Latins and as Vertumnus by the Etruscans. His theories, notwithstanding the swift acknowledgement of the illegitimacy of some of the sources he used, enjoyed wide and long-lasting regard because they seemed to succeed in connecting the evidence of the Old Testament with that of the classical sources that were in the process of rediscovery, thus melding two distinct cultural traditions.

Similar theoretical positions were maintained by another well-known Viterban, Cardinal Egidio da Viterbo (1469–1532), who in his *Historia XX saeculorum* asserted that the Etruscans were natives of Chaldaea and the civilizers of Italy, and that their history developed in parallel with that of Israel. The Etruscan *lucumoni* would correspond to the Patriarchs of Israel.¹⁶⁶

In Tuscany, early and special attention to the Etruscans was due to the historian Giovanni Villani (ca. 1280–1348), who in his *Cronica* records with admiration the Etruscan past and compares it with the quite different present that thrived on the same ground, recommending the Etruscan governing ability as a political model for the Florentine ruling classes of the time.¹⁶⁷

The same enterprise, but more explicitly, was maintained by Coluccio Salutati, who in a letter dated July 19, 1388, suggested looking to the Etruscans in progressing toward civil and moral renewal. Leonardo Bruni—Salutati's pupil—continued along the same lines by praising the Etruscans and their republican system, as opposed to the imperial system of Rome, in his *Historiarum Florentini populi libri XII*.¹⁶⁸

In Tuscany, attention was paid—however prematurely—to individual objects that more or less accidentally came to light. Between 1491 and 1495, Francesco di Giorgio completed a drawing of a cinerary urn found in Chiusi; in 1507, Leonardo da Vinci drew the plan and elevation of a monumental hypogeum found at Castellina in Chianti. In the mid sixteenth century, Vasari

recalled another monumental hypogeum discovered at Chiusi that was mistakenly identified as Porsenna's. Antonio da Sangallo the Younger had previously drawn a variety of Etruscan antiquities, and offered a reconstruction of the tomb of the famous king from Chiusi on the basis of the description given by Varro and transmitted by Pliny.¹⁶⁹

The architecture of the Etruscans had already been appreciated by Leon Battista Alberti and by Filarete (Antonio di Pietro Averlino), while positive judgment of Etruscan art was passed by Giorgio Vasari, who, in the famous Chimera of Arezzo, found in 1553, recognized "an Etruscan style" as opposed to a Greek style. Alberti chose to refer to the plan of the Etruscan temple—known from the description given by Vitruvius—in his project for the church of Saint Andrew in Mantua.¹⁷⁰

Still in Tuscany, already during the fifteenth century a passion had developed among the Medici family for collecting Etruscan finds, or taking them. Donatello was the first curator of the hoard gathered by Cosimo the Elder. We also know of some items given to Lorenzo the Magnificent, including a statue with inscriptions from Pistoia, an inscribed terra-cotta urn from Siena, vases from Arezzo, and a ceramic vase from Greece.¹⁷¹

The second son of Lorenzo the Magnificent, who became pope (1513–1521) under the name of Leo X, commissioned Baldassarre Peruzzi to depict events from Etruscan and Roman history in a room of the Campidoglio.¹⁷² In this new cultural climate, the accent shifted (and would do so increasingly in the future) from the republican organization of the Etruscan city-states, which had been extolled by Coluccio Salutati and Leonardo Bruni, to the figure of the monarch Porsenna.¹⁷³

Under grand duke Cosimo I (1519–1574), there began to be attributed to the Etruscans an ever-increasing ideological value. He proclaimed himself *Magnus Dux Etruriae* and in his court propaganda, his politico-military behavior came to find precedent and—to some extent—motivation in the Etruscan past. This interest drove the increase in acquisitions of antiquities and added to the Medician collection three especially prestigious works discovered between 1541 and 1566—the Minerva, the Chimera, and the *Arringatore* (the Orator).¹⁷⁴ The grand duke also established the Accademia Fiorentina, which was joined by most of the intellectuals who gravitated to the court. Their work often returned to the theme of the Etruscans' supremacy, successfully reviving, in the debate about the language, the thesis that was initially elaborated in pontifical circles. In the *Gello*, P. F. Giambullari stated that the Etruscan language underlay the Tuscan language and that it could not be understood without a thorough grounding in Hebrew and Chaldaean.¹⁷⁵

Fig. 4.1: Thomas Dempster, *De Etruria regali*, Florentiae 1723 (Photo Delia Fina)

In 1551, the first book devoted to the Etruscans was published—significantly, it is dedicated to Cosimo I—by Guillaume Postel: *De Etruriae regionis quae prima habitata est originibus, institutis, religione et moribus et in primis de aurei saeculi doctrina et vita praestantissima quae divinationis*

The seventeenth century could have opened with the appearance of another monograph dedicated to the Etruscans, the monumental *De Etruria regali*, by Thomas Dempster, a Scottish teacher at the athenaeum in Pisa. *De Etruria regali* had been written between 1616 and 1619, but remained unpublished for another century. Dempster used the ancient and Renaissance sources that were available to him and any antiquities that could be recognized as Etruscan. The work includes encomia toward the ruling house of the Medici, for whom he arrived at the hypothesis of Etruscan origin, but Dempster's work did not see the light of day until a century later (Fig. 4.1).¹⁷⁷

During the seventeenth century, major new collections of antiquities were founded that featured Etruscan items, albeit on a small scale compared to Greco-Roman items. One such example is the assemblage gathered in Rome by the German Jesuit Athanasius Kircher. The Volterranean aristocrat Curzio Inghirami was certainly a unique figure. Inghirami forged Etruscan and Roman inscriptions and published them in a volume—*Ethruscarum antiquitatum fragmenta*—printed in Frankfurt in 1637 to promote his own native city. The scholar Leone Allacci promptly identified them as fakes, but Inghirami did not recant and continued to defend his actions.¹⁷⁸

Interest in the Etruscan world continued—albeit in a minor way—in the Papal States as well, where, understandably, more attention was paid to Rome's imperial past. In 1669 we hear of research carried out at Veii on behalf of cardinal Flavio Chigi.

2The eighteenth century: *Etruscheria*

The lukewarm interest in the Etruscan world characteristic of the 1600s changed profoundly in the next century. Thomas Dempster's unpublished manuscript was acquired by the English bibliophile Thomas Coke, who entrusted its publication and the necessary revisions to the antiquarian Filippo Buonarroti. The work appeared in 1723–1724 and set off a period of considerable interest in the Etruscans, which has received the name Etruscomania (It. *etruscheria*). Scipione Maffei, one of its most influential practitioners, observed that Dempster's volume had the principal merit of stimulating the research of many scholars.¹⁷⁹

During this cultural period, the most amazing and varied achievements were attributed to the Etruscans, including feminine beauty. The principal actors of the time were above all intellectuals and scholars active in communities with a significant Etruscan past. To glorify the Etruscans was for them a way of singing the praises of their own native or adopted cities.

In this intellectual milieu, the figure of Monsignor Mario Guarnacci (1701–1785) stands out. Born in Volterra, Guarnacci studied in Florence and Pisa,

and then moved to Rome, where he undertook a successful ecclesiastical career that was interrupted suddenly in 1757. Returning to the city of his birth, he focused his studies on the Etruscans. His most important work was *Origini Italiane* (1767), in which he maintained the chronological priority of the Pelasgians-Etruscans over the other peoples of Italy and Greece.¹⁸⁰

The other leaders of the debate were the greatest antiquarians of the age, including the Scipione Maffei, Anton Francesco Gori, and Giovan Battista Passeri. Gori, a Florentine, is responsible for a series of editorial projects of great promise, such as the *Inscriptiones Graecae et Latinae in Etruria urbibus extantes*, the *Museum Etruscum*, and the *Museum Florentinum* (Fig. 4.2).

Maffei, from Verona, was the author of, among other things, *Etruria illustrata*, which remained unpublished, and of *Della nazione etrusca e degli Itali primitivi*, which was published in 1739.¹⁸¹

Around 1730, a dispute between Maffei and Gori arose about the Etruscan alphabet, which degenerated into a real quarrel. In competition, the two of them set out on tours through the Etruscan region to gather information and materials. Gori reached Arezzo, Cortona, Perugia, Chiusi, Montepulciano, Siena, Poggibonsi, Pogni, Panzano, and San Casciano Val di Pesa. Maffei, on the other hand, got to Rome, Civita Castellana, Tarquinia (at the time called Corneto), Bolsena, Chiusi, Montepulciano, Volterra, Siena, Monteriggioni, and Florence.¹⁸²

Philo-Etruscan attitudes are also found in the theoretical writings of Giovan Battista Piranesi, and in Girolamo Tiraboschi's wide-ranging work *Storia della letteratura italiana* (1772). The former, in *Ragionamento apologetico in difesa dell'architettura egizia e toscana* (1769), focuses on the debased artistic output of Etruria, which he believed to have profoundly influenced that of Rome. Tiraboschi proposed that Italian literature could have sprung from the Etruscan, though he did not gloss over the problems.¹⁸³

The first Italian reformers were also fascinated by the Etruscans, and they tended to accentuate their republican-style institutional arrangements and the federal structure of their state. Among these we may mention the jurist Giovanni Maria Lampredi (*Saggio sopra la filosofia degli antichi Etruschi*, 1756) and Carlo Denina (*Rivoluzioni d'Italia*, 1769). The topic of the Etruscans also came up in the nascent journalism of the day, as is suggested by the experience of the weekly *Novelle Letterarie* published in Florence from 1740 on the initiative of Giovanni Lami.¹⁸⁴

Interest in the Etruscan world was not limited to the Italian antiquarian and cultural sphere. Among the foreign scholars, at least Anne-Claude-Philippe de Caylus and Johann Joachim Winckelmann must be remembered. In his *Geschichte der Kunst des Alterthums* (1764), the latter attempted the first critical analysis of Etruscan art, proposing a classification and subdivision into three styles. The first and oldest was quite “rigid” and similar to the Egyptian; the second was more developed; and the third was characterized by slavish imitation of Greek art. He ended with a negative evaluation of

Etruscan artistic output, while continuing to recognize its chronological primacy, whose limitations he identified by attributing them to the character and habits of thought of the Etruscans: “It seems that they were more inclined to melancholy and sadness than the Greeks ... and it may be observed that a man endowed with such a temperament is undoubtedly suited to the deepest study, but it leads to profound sensations; for this reason, the sort of mild emotion is not generated in him that renders the spirit perfectly sensible to the beautiful.”¹⁸⁵

During the eighteenth century, an important role was played by the Accademia Etrusca in Cortona, which was founded in 1726 by the brothers Marcello and Ridolfino Venuti (Fig. 4.3), and the Società Colombaria in Florence, established in 1735.¹⁸⁶

3Nineteenth century: Etruscology

A severe verdict on the results of eighteenth-century scholarship was handed down by Luigi Lanzi (1732–1810), who is considered—not without reason—the father of scientific Etruscology (Fig. 4.4). The author of *Saggio di lingua etrusca e di altre antiche d'Italia* (1789) was responsible for the almost completely definitive decipherment of the Etruscan alphabet and an initial sketch of phonetics and grammar. His judgment of Etruscan art—in comparison with that authoritatively expressed by Winckelmann—was less reductive but did recognize the influence of the Greek experience.¹⁸⁷ Meanwhile, a different periodization of Etruscan art into five phases was proposed by Christian Gottlob Heyne (1729–1812).¹⁸⁸

The nineteenth century opened with the publication of a significant volume, *L'Italia avanti il dominio dei Romani* (1810) by Giuseppe Micali, whose innovativeness was not understood at the time in antiquarian circles because of its primarily historical and economic approach. Its underestimation must also have influenced the intellectual development of the author, who was only loosely tied to the Italian scholarly environment. The picture of the nineteenth-century scholar was fully reevaluated in the 1970s and 1980s by Massimo Pallottino, who recognized Micali's role as the “definitive start” of Pre-Roman Italian historiography comparable to that of William Mitford for Greek historiography and Barthold Georg Niebuhr for Roman.¹⁸⁹

Another important book was published in 1828, *Die Etrusker* by Karl Otfried Müller, which is considered the first handbook of Etruscology; it contains yet another critical judgment (or prejudgment) on the artistic output: “The art of Etruria seems like an exotic plant.”¹⁹⁰

Fig. 4.4: Portrait of Luigi Lanzi (1732–1810). Oil painting, circa 1800 (Photo Della Fina)

Archaeological investigation on the ground carried out during the nineteenth century yielded considerable results. Entire necropolises were investigated (and often plundered), numerous sacred precincts were brought to light, and some major cities were located. Among the most important undertakings was the discovery of the necropolis of Vulci, accomplished by the prince-archaeologist Luciano Bonaparte, brother of Napoleon. His successful excavations, carried out with innovative methods for the time, allowed him to amass a noteworthy collection, which was soon dispersed. He

was also a late adherent to “Philo-Italic” theories. For example, he continued to maintain the Etruscan origin of the Greek vases he discovered—against the opinions of Luigi Lanzi and Eduard Gerhard—and the supremacy of Etruscan art. These opinions were probably also due to the desire to curry favor with pontifical authority and, more generally, toward the nascent “public opinion” of the Italian peninsula, hoping to build a political future for his own family in Italy.¹⁹¹ This is not to say that the prince considered the Philo-Italic positions outmoded, and that he favored them solely to exploit them, but that he realized they concealed ideal and political values and here recognized the ideological bases for the more or less imminent redemption of Italy.¹⁹²

Successful campaigns of excavation also concerned other sites in southern Etruria. At Cerveteri, in 1834, fifty-three chamber tombs were discovered, including the tombs of the Shields and Chairs and the tomb of the Painted Animals. A few years later, the archpriest Alessandro Regolini and General Vincenzo Galassi found the famous tomb that bears their names. At Tarquinia, many of the painted tombs we know today were discovered—among them the tomb of the Baron, found by August Kestner in 1827, and the tombs of the Triclinium, the Querciola, and the Typhon, brought to light respectively in 1830, 1831, and 1832.¹⁹³

In central and northern Etruria, the most thoroughly investigated city was Chiusi, where the antiquities market was especially rapacious. Over several decades, trafficking in archaeological objects in the area became an economic activity of primary importance, second only to agriculture.¹⁹⁴ At Perugia, in 1840, the Hypogeum of the Volumni was discovered and promptly published by Giovanni Battista Vermiglioli.¹⁹⁵

The first half of the century also saw the dynamism of singular archeologist-entrepreneurs like Alessandro François, who has given his name to a very famous painted tomb in Vulci, and the members of the Campanari family. Originally from Tuscania, they were among the promoters of a show organized in London in January of 1837, which enjoyed great success in England.¹⁹⁶

Special importance accrues to the 1829 founding of the Istituto di Corrispondenza Archeologica in Rome, which, through a compact network of corresponding members, succeeded in documenting the finds that continued to be made, preserving their memory. The Istituto also maintained solid relationships with the contemporary flourishing trade of antiquities.

The opening decades of the nineteenth century also saw the founding of several museums devoted to Etruscan antiquity, among them the Museo Gregoriano Etrusco in the Vatican, which opened in 1837.¹⁹⁷

The fevered activity of these years flowed together in the volume *The Cities and Cemeteries of Etruria* by George Dennis (first edition 1848), which was destined for remarkable and long-lasting success. Born in London in 1814, Dennis undertook a diplomatic career, which culminated in postings as consul in Crete, Sicily, and Smyrna, but continued to cultivate his interest in

literature and archaeology. They were combined in his book on the Etruscans, which was updated and reprinted several times.¹⁹⁸

The second half of the nineteenth century was characterized by a further increase in the documentary base. The excavations carried out in the middle of that period were already realized to be important, but others were added, including Orvieto (the Etruscan Velzna) with the 1863 discovery in Settecamiini of two painted tombs, which preserve the name of the discoverer Domenico Golini, and the excavation of the necropolises of Crocifisso del Tufo and of Cannicella.¹⁹⁹

In the first decades of Italian Unification, there was renewed attention to archaeological museums centered on Etruscan themes. In 1870, one was opened in Florence, followed by one in Bologna (1881) and the Villa Giulia in Rome (1889). In these decades, primarily on the initiative of German scholars, *corpora* were still dedicated to Etruscan mirrors (the project had begun in 1839), cinerary urns, and inscriptions. Other works of synthesis also appeared, such as Jules Martha's handbook *L'art étrusque* (1889), where the negative evaluation of Etruscan art does not appear to have been modified at all.²⁰⁰

Fig. 4.5: View of the Campanari Garden, Tuscania (after Dennis 1848)

4The twentieth century

The 1916 discovery of the Apollo of Veio, in a vastly different cultural climate, contributed to altering the verdict on Etruscan art. The “limitations” designated by Winckelmann and those who followed him became “values” in

the interpretations of the artistic avant-garde critics of the 1920s and 1930s, who were inclined to transcend naturalistic and figurative art.²⁰¹

In 1928, the first Congresso Internazionale Etrusco was organized (preceded in 1926 by the first Convegno Nazionale Etrusco), and in 1932 the Istituto di Studi Etruschi e Italici was officially recognized, which has played a central role in the development of Etruscological research ever since.

In the first half of the twentieth century, excavations in the necropolises continued (Antonio Minto's discoveries at Populonia are especially noteworthy), and useful collections—at least Arvid Andrén's *Architectural Terracottas from Etrusco-Italic temples* (1939–1940) must be mentioned—and a variety of monographs on individual sites were published. Among these we may highlight those dedicated to Chiusi by Ranuccio Bianchi Bandinelli (1925), to Tarquinia by Massimo Pallottino (1937), and to Populonia by Antonio Minto (1943).

The central figure of twentieth-century Etruscology is M. Pallottino (1909–1995), to whom is owed the ascent of the study of the Etruscans and the other peoples of ancient Italy to the dignity of an independent scientific discipline (Fig. 7.1.). Among the results of his work is the solution he proposed to the problem of Etruscan origins—which he began by examining Herodotus—arrived at by shifting attention from the question of origin to the question of the formation of the people. Among his other major contributions, he enhanced our comprehension of the Etruscan language and of the historical development of the Etruscans, who he saw fully participating in the cultural sphere of the Italian peninsula of the first millennium BCE. Furthermore, Pallottino was the organizer and director of successful excavations, including of the Pyrgi sanctuary in the environs of Caere (Cerveteri), which yielded the renowned bilingual gold tablets with inscriptions in Etruscan and Phoenician.²⁰²

The second half of the twentieth century was characterized by the work of Pallottino and his school. Excavations were begun that focused primarily on dwellings and commercial structures, breaking with the tradition that—as we have seen—favored the necropolises. Close to the excavation of the Pyrgi sanctuary should be mentioned the investigation of the residential quarters of the center of Acquarossa near Viterbo, advanced by the Swedish Institute of Classical Studies in Rome, and of Murlo (near Siena), directed by American archaeologists.²⁰³

In more recent years, scientific investigations have concerned the urban areas of several major *poleis*: Cerveteri, under the direction of Mauro Cristofani (who was also responsible for the excavation of several buildings in the industrial quarter of Populonia); Tarquinia, explored by Maria Bonghi Jovino; and Veii. Excavations have not been lacking in commercial areas such as quarters dedicated to craftsmen, ports, and factories. On this subject, we may mention the excavation, carried out by Giovannangelo Camporeale, of the installation near the lake of Accesa that is closely linked with mining.

5Etruscan Art or Art of the Etruscans?

Abstract: It is agreed that Etruscan art may be associated with the whole range of figural pieces produced in the historic region usually referred to as Etruria, and with a period extending from the Early Iron Age to the Middle Hellenistic (ninth–second centuries BCE). This definition, though seemingly obvious, presents us with a historical and ethnic context which is both challenging and compelling.

As Greek art belongs to the Greeks and is an expression of what it is considered Greek, so must Etruscan art belong to the Etruscans and reveal specific elements of their cultural identity. We may question, however, whether it is really justified to claim to be able to identify a uniform and consistent Greek identity among the fragmented Greek city-states (for as long as they maintained their independence and autonomy) or, later, within the variegated context of the Mediterranean koine of the Hellenistic era. As a consequence, and much more seriously, we must face the problem of recognizing a *single* Etruscan identity reflected by manifestations of art, which, although local, developed under the influence of concepts that emerged largely from ethnically Greek—and not Etruscan—contexts. We may say, then, that the paradigm for Etruscan art was in fact derived from a different source, namely Greek art (though of questionable homogeneity), and that this source paradoxically became the determining criterion of an Etruscan identity, always defined in the negative, *ie.* as non-Greek.

We mean that, if Etruscan art may be said to rely on Greek sources, its alleged original elements must be sought on those occasions when this dependence on the Greeks appears to have become somewhat looser or to have lessened.

Keywords: antiquity, renaissance, iconology, Etruscan art's history

Introduction

It is agreed that Etruscan art may be associated with the whole range of figural pieces produced in the historic region usually referred to as Etruria, and with a period extending from the Early Iron Age to the Middle Hellenistic (ninth–second centuries BCE). This definition, though seemingly obvious, presents us with a historical and ethnic context which is both challenging and compelling.

As Greek art belongs to the Greeks and is an expression of what it is considered Greek, so must Etruscan art belong to the Etruscans and reveal specific elements of their cultural identity. We may question, however, whether it is really justified to claim to be able to identify a uniform and consistent Greek identity among the fragmented Greek city-states (for as long as they maintained their independence and autonomy) or, later, within the variegated context of the Mediterranean koine of the Hellenistic era. As a

consequence, and much more seriously, we must face the problem of recognizing a *single* Etruscan identity reflected by manifestations of art, which, although local, developed under the influence of concepts that emerged largely from ethnically Greek—and not Etruscan—contexts. We may say, then, that the paradigm for Etruscan art was in fact derived from a different source, namely Greek art (though of questionable homogeneity), and that this source paradoxically became the determining criterion of an Etruscan identity, always defined in the negative, *ie.* as non-Greek.

We mean that, if Etruscan art may be said to rely on Greek sources, its alleged original elements must be sought on those occasions when this dependence on the Greeks appears to have become somewhat looser or to have lessened.

1In antiquity

This critical dilemma is evident in the reflections of at least two ancient writers who, united by an idea of ethnicity which is far less problematic than our own, identified Etruscan art as possessing the features of an exemplary non-Greek artistic language.

Strabo (17.1.28) compared the bas-reliefs which adorn the “wings” of Egyptian temples with those of archaic Greek and Etruscan art, a suggestion that was to enjoy an extremely long life. Some seventeen centuries later, Johann Winckelmann and Christian Heyne likewise identified a primitive and “Egyptianizing” phase of Etruscan art.²⁰⁴

According to the ancients, just what this so-called “Egyptian” Etruscan art was is unclear, but a well-known passage in Quintilian (*Inst.* 12.10.7–9) may be of assistance. It narrates a sort of evolutionary sequence of Greek bronze sculpture, and places the works of Callon and Hegesias next to Etruscan pieces (*Tuscanicis proxima*) on the basis of a chronological-stylistic parameter related to the hardness of their modeling or shape. The rigidity of modeling to which Quintilian refers would have gradually softened, from the most archaic sculptures (and therefore the more “Tuscan”) in the works of the masters of Aegina, up to the time of Calamis and Myron. The use of this hard approach seems to have lessened with the *diligentia* and the *decor* (of Polyclitus), and to have been finally abandoned in the works of Lysippus and Praxiteles. Therefore, the ideal of softness in sculpture should be assumed to be the same as naturalness—that is, naturalism (Lysippus’s *veritas*); and the ideal of hardness, which seemed to be so characteristically Etruscan (or Egyptian), to be nothing but a lack of naturalism. When one finds in the same essay (12.10.1) the possible suggestion of a comparison that claimed some similarity between Tuscan sculpture and Asian eloquence, and so between Greek sculpture and Attic eloquence (*ut Graecis Tuscanicae statucae, ut*

Asianus eloquens Attico), one would understand that the lack of naturalism of Etruscan art was caused not only by its morphological delay, but also by an overload of exaggerated, unnatural schemata and postures.

We have stressed these passages of ancient literature because they contain more than one of the slogans that extend through all of the (modern) history of Etruscan art criticism: the idea of the persistently exotic and archaic connotations and an almost rhetorical emphasis on an artistic language that seemed to belong more to the original figural world of the eastern Mediterranean than to the later spread of the great Greek naturalism.

2In modernity

2.1From Renaissance to Enlightenment

As early as the sixteenth century, the penetrating stylistic comments made by Giorgio Vasari on the impressive bronze known as the Chimaera (unearthed in November 1553 during work on the fortifications of Arezzo)²⁰⁵ highlighted the contradictory “Etruscan manner” of this piece. The stylistic character of Etruscan sculpture—indicated by the “clumsiness” of the Chimaera’s mane—was recognized on the basis of a somewhat vague notion of Greek art, which Vasari was able to gather from his knowledge of Roman sculpture.

We must, therefore, seek the critical fate of Etruscan art—although considered to be indigenous, Tuscan and thus Italian—between the poles of Egypt and Greece. In the fundamental theoretical debates of the eighteenth century, the studies of Winckelmann and Heyne and the work of the Count of Caylus and the Abbot Luigi Lanzi began to understand the formative history of the Etruscan artistic language in terms of its participation in a process of Hellenization, whereby it was gradually freed from those primitive elements—whether Egyptian or Pelasgian or Egyptian and Pelasgian—from which it had in part originated.²⁰⁶ It is important to note that by this understanding, it is simply not possible to identify any unmistakably Etruscan elements within the works of the more advanced—and so, more fully Hellenized—stages. As a consequence, such ethnic, non-Greek elements were sought in intermediate stylistic periods. Winckelmann’s so-called “second style” refers to the “strained and violent” figures—colored, we might say, by an Asian eloquence—that were taken as an indication of a collective psychology characterized by a sense of jealously guarded freedom and violent melancholy, personality traits which can be applied to the Tuscan people of the Middle Ages and beyond.²⁰⁷

The recognizably “Etruscan” elements of Etruscan art were therefore based on the extent to which they differed from Greek art. The latter abounds in attractive and authoritative models, for just this reason having been called

“classical;” but a truly “classical” supreme model is eminently inimitable. In such a perspective, the unavoidable failure of Etruscan art had to be ascribed to a hereditary predisposition and temperament. Here we may notice a significant deviation from the ideology of the Enlightenment. The early romantic concept of a “spirit of the people” was even being applied to the visual arts.

2.2 Nineteenth century

Etruscan studies in the nineteenth century, which had developed alongside advances in archaeology and epigraphy as sciences with an increasingly solid methodological foundation, yielded useful corpora of figural monuments, including engraved mirrors and urns with reliefs. But they addressed the theme of the difference between Greek and Etruscan art in nothing more than taxonomic terms (this was particularly the case with discussions of decorated pottery).²⁰⁸ In comparison with the intense debate of Winckelmann’s time, scholars did not take significant steps toward a general historical interpretation of Etruscan art until the end of the century, when the synthesis by Jules Martha—despite the promising title of *L’art étrusque*—was nothing more than a comprehensive, purely antiquarian survey.²⁰⁹

2.3 Early twentieth century

The most critical period for debate on Etruscan art is in fact the twentieth century, with a particularly lively phase, at least in Italy, from the 1920s to the 1940s. The reasons for this chronological and cultural framework are clear. From a methodological perspective, we may refer to the work of the anti-Winckelmann group that had developed among art historians at the University of Vienna, which led to the abandonment of Hellenophile prejudices and to the historical contextualization of other possible figural options (especially those of Roman art).²¹⁰ On the other hand, from an ideological-political perspective, the completion of the process of the political unification of the Italian State led some of the major scholars of antiquity to reassess the evidence of the several pre-Roman archaeological cultures of Italy and, most notably, the Etruscan.²¹¹ Lastly, we should also take into consideration anti-classical artistic tastes,²¹² which were stimulated within the intellectual milieu of the early twentieth century by the displays of unexpected masterpieces, such as the terra-cotta statues of the temple of Portonaccio at the Museum of Villa Giulia (Figs. 51.1. and 51.7).

In Italy, this debate, which precedes the tragic cut-off point of World War II, developed almost entirely on the assumption that particular ethnicities are

connected to artistic productions, and it involved a close comparison of the figural world typical of the Etruscans with that of other ancient Mediterranean cultures. This approach claimed that Etruscan artistic concepts survived and extended into the Italian Middle Ages and the Renaissance (such claims were made to argue for the originality of such works and to grant them a position within the nation's cultural history). The attempt to maintain this position was carried out with critical tools and terminology that were much closer to Winckelmann's than to Alois Riegl's, and that were dangerously exposed to the Romano-centric propaganda of the fascist regime. In fact, they produced an irreversible crisis within the interpretative model of ethnicity, a model consumed by internal contradictions.²¹³ The extent of this crisis can be clearly read in the studies of Ranuccio Bianchi Bandinelli, who had a firsthand knowledge of German bibliography and found in the philosophy of Benedetto Croce a theoretical approach appropriate for the full reestablishment of a historical view of ancient art. The art of the Etruscans (and of other ethnic groups in pre-Roman Italy) was described in his studies, through the metaphor of language, as being something of a lowly "dialect" in contrast with the high and "literary" paradigm of Greek art.²¹⁴

2.4 Post-World War II

Immediately after the war, Italy saw a substantial slowdown—almost a collapse—of this debate, with Bianchi Bandinelli himself even turning to other issues: the representation of Greek figural art as an art of reality; and regarding the field of Roman art, the development of a characteristically dialectical model of interpretation.²¹⁵ In Germany, on the other hand, Guido von Kaschnitz-Weinberg identified what he presumed to be a structural and unchanging aspect of Etruscan (and Italian) art, a persistently "stereometric" organization of the form; so he relocated the connotation of ethnicity to within the artwork itself, a process that led the Viennese *Kunstwollen* ("taste") to become an irrational metaphysical category.²¹⁶

As a result, the general awareness that it was impossible to speak of an "Etruscan" art (understood as a product and expression of an ethnic culture) gradually surfaced. In place of "Etruscan art," an alternative model was developed in which the art *of the Etruscans* (that is, *for the Etruscans*), although produced in Etruria for the Etruscan market, appeared to be quite largely based on an alien, imported figural repertory. So Massimo Pallottino introduced and developed new ways of understanding the relationship—the dualism—between an artistic center and its periphery, and argued that the periphery, too, could be characterized by activity and creativity, both of which could be identified in the selection criteria used and in the timing of the adoption and application of Greek historical styles.²¹⁷ The idea of an Etruscan civilization, which inspired a memorable and multifaceted series of

exhibitions in 1985,²¹⁸ still fit into the varied social context of the Greek city-state and could be used to explain (sometimes using the anthropological model of colonial “acculturation”) the relationship between and application of external contributions and local modifications.

It is no coincidence that two of the most influential art monographs of the 1970s and 1980s were entitled *The Art of the Etruscans* instead of *Etruscan Art*.²¹⁹ This signified a conscious detachment from any illusory ideas of ethnicity and the use of a strategic approach to the analysis of the economic and social structures (*Production and consumption* is the eloquent subtitle used by Mauro Cristofani).

This approach has led research to focus on content rather than form. If there is no “Etruscan” style as such, but only a range of Greek styles (and before these, Levantine styles) that were introduced over time in Etruria and from which Etruscans extracted the forms of their artistic language, it is the themes within Etruscan art that become the true object of the critics. An exegesis of such topics has become the high point of any analysis. These forms of visual communication are not Etruscan, in this sense, because of their morphology, but on account of what it is that they represent, in that the *how* (i.e., the style, the way they look) is modeled on the *what* (i.e., the subject, the content of the images).

This, I believe, may justify the turning point that originated in Erwin Panofsky’s iconology, one of the most innovative critical trends of the last thirty years. It may help us to understand why Françoise-Hélène Massa Pairault identified this methodology as the best way to coherently develop the teachings of Bianchi Bandinelli.²²⁰ Given the scarcity (or absence) of literary sources and the lack of a sufficiently instructive context, the interpretation of iconographic codes must be pursued through a circumstantial reconstruction of the representational programs, and it is within such schemas that it may be possible for us to recognize the specific contribution (which is to some extent a cultural identifier) of the Etruscan “producers” and “consumers” of art.

An alternative form of criticism, built on the seemingly more traditional base of morphological analysis and on the history of styles, is exemplified by the (posthumous) essay of Otto Brendel,²²¹ a figure who has, with a few prominent exceptions, been unjustly marginalized within the Italian debate. Brendel does not doubt that it is possible to identify an Etruscan art that was organic, and that appeared to him to be the only Western equivalent of the Greek classical (thus virtually international) experience. As a consequence, he made use of the same Greek sequence of art styles (from the Geometric to the Hellenistic) to classify Etruscan art, arguing that such an approach would allow for the systematic identification of the ways in which Etruscan productions differed from the Greek norm.

In my opinion, a stylistic criticism based on Brendel can very profitably accompany and complement the interpretation (and decryption) of figural programs. Let us assume that there was a certain amount of continuity and

group cohesion among the purchasers of art. In the Etruscan city-state, these consumers were for centuries a structured and aristocratic elite, and, as a consequence, the figures and monuments that were designed for commemorative purposes—both in life and above all in death—were almost always of a private and not a civic character. It is possible, then, to detect in the adoption (or rejection) of Greek language the presence of a conscious strategy of communication, which adopted Greek styles according to circumstances and requirements that were strictly related to the contents.

This point may be clarified with some examples. The artisans who served the seventh-century Etruscan *aristoi* adapted the animalistic and mythological iconography expressed in the grandly naturalistic manner of the palatial schools of the Near East. They did this in order to express princeliness in funerary contexts²²² through a direct transfer of key images of power, legitimacy, and divine protection from the Levantine royal citadels to the necropolises of Tyrrhenian Italy. This choice obviously involved an irreversible conversion to a properly figural art.

In a similar sense, in the second half of the sixth century, the sophisticated language of Eastern Greek sculpture and painting—created to lend an appealing grace to the luxury of the tyrannical courts—became the typical Etruscan style that can be found on the antefixes and *acroteria* of temples as much as on the walls of tombs and on high-quality painted pottery. At the end of the century, Thefarie Velianas, the king of Caere, built an architectural complex like a Levantine sanctuary in the sacred northern precinct of Pyrgi and dedicated it to the Phoenician goddess Ishtar.²²³ He commanded his terracotta modelers to design the antefixes of the house of the sacred prostitutes by an East-Greek reinterpretation of images, which were at least partly derived from ancient Mesopotamian and Urartian models. Such an iconographic choice constitutes a revival of the Orientalizing culture and does not appear to have been borrowed from the Greeks, but must be regarded as genuinely Etruscan.²²⁴

Some other examples may be taken from the Hellenistic era, with its engraved mirrors displaying mythological scenes, highly complex painting programs (such as the François Tomb at Vulci), and reliefs of the funerary urns of Volterra, Chiusi, and Perugia. The valuable and pioneering iconological survey of Massa-Pairault²²⁵ was followed by contributions from young scholars.²²⁶ Using not entirely coincidental interpretative criteria, they agree in identifying the presence of an articulated system of schemata that were derived from the Greek narrative repertoire and were reused in these late monuments as adaptable all-purpose additions. Those schemata can be assembled to signify ethical concepts as well as the fundamental values of family life and *concordia civium*.

Natacha Lubtchansky

Iconography and iconology, Nineteenth to Twenty-first centuries

Abstract: The different approaches to the figure-decorated material of the last fifty years, such as Erwin Panofsky's opposition between iconography and iconology, or the anthropological study of the "cité des images" developed in the "École de Paris" around Jean-Pierre Vernant and Pierre Vidal-Naquet, have not superseded some of the positions that were taken in the early nineteenth century. From that time through the most recent publications, we can observe three distinct interpretations of the Etruscan images. First, they represent the happy or terrifying life the dead can expect after the funerary rituals are completed; second, they symbolize the aristocratic life they led and, like the *symposion* sets deposited in the grave, define the social status of the dead; and third, they reproduce the rituals conducted during the funerals, as a testimony of their correct observance.

It therefore seems necessary not to separate the study of the iconography from various questions concerning the date, artist, place of production, and external formal influences displayed by the image.

Keywords: images, Greek, Etruscan

Introduction

Reflecting on the different ways figure-decorated representations on Etruscan artifacts have been interpreted, one has to look back to the early period of scholarship when those images were discovered in considerable number and their meanings were first thoroughly discussed – that is, back to the beginning of the nineteenth century. At that time, the discovery of a vast number of painted vases in the necropolis of Vulci and the unprecedented evidence of wall paintings in the Monterozzi cemetery in Tarquinia-Corneto added a lot of new evidence to the already considerable number of relief urns and engraved mirrors, and antiquarians had to invent and elaborate original methods to classify and explain those items.

The different approaches to the figure-decorated material of the last fifty years,²²⁷ such as Erwin Panofsky's opposition between iconography and iconology, or the anthropological study of the "cité des images" developed in the "École de Paris" around Jean-Pierre Vernant and Pierre Vidal-Naquet, have not superseded some of the positions that were taken in the early nineteenth century. From that time through the most recent publications, we can observe three distinct interpretations of the Etruscan images. First, they represent the happy or terrifying life the dead can expect after the funerary

rituals are completed; second, they symbolize the aristocratic life they led and, like the *symposion* sets deposited in the grave, define the social status of the dead; and third, they reproduce the rituals conducted during the funerals, as a testimony of their correct observance. The funerary orientation of some of these interpretations is explained by the archaeological provenance of most of the Etruscan images: they were produced for the grave or deposited in it.²²⁸

Fig. 6.1: Tarquinia. Copy of Tomb of the Inscriptions (after Torelli 1997, p. 134, fig. 107).

Another recurrent statement by archaeologists and art historians over the last two centuries is the importance of the debt owed by Etruscan art to Greek artifacts and artists in every period. This influence is taken into account by scholars when dealing both with the formal components of the figure-decorated scene and with its meanings. It therefore seems necessary not to separate the study of the iconography from various questions concerning the date, artist, place of production, and external formal influences displayed by the image.

The following chronological survey of nineteenth- to twenty-first-century scholarship on Etruscan figure-decorated representations focuses on two monuments—the Tomba delle Iscrizioni (Tomb of Inscriptions) in Tarquinia (510 BCE; Fig. 6.1) and the calyx-krater from Vulci in the Cabinet des Médailles in Paris (330–300 BCE; Fig. 6.2)—both discovered around 1830 and discussed throughout this period by numerous scholars.²²⁹

(after *Monuments Inédits* 1834, pl. 9).

1The establishment of research methods in the second quarter of the nineteenth century: Corpora and series

An appropriate starting point is the Latin maxim of Eduard Gerhard, published in his famous *Rapporto Volcente*:²³⁰ “Monumentorum artis, qui unum uidit nullum uidit, qui milia uidit, unum uidit” [Concerning monuments of art, who has seen one has seen none; who has seen a thousand has seen one]. This sentence states the “corpus” principle and explains the method of analyzing images by arranging them in series. Two of these nineteenth-century corpora are that of engraved mirrors, started by Gerhard—who abandoned the previous identification as mystic plates²³¹—and that of Hellenistic figure-decorated urns, also conceived by Gerhard but carried out by Heinrich von Brunn (1870) and then Gustav Körte (1890–96), who assembled an extensive series of items, almost all decorated with mythological scenes.²³² The other two important corpora of Etruscan artifacts are of wall paintings and figure-decorated vases, both of which were in progress for many years (see below).

Concerning the figure-decorated vases, the first question to be solved at that time was their place of production. They represented a major field of antiquarian study because they were the main documents other than Greek and Latin texts from which to learn of myths and ancient practices. During the seventeenth and eighteenth centuries, all such vases—kept on library shelves above the books—were considered Etruscan, because they were discovered in the necropolises of Etruria, part of the phenomenon known as “Etruscomania.” By the second quarter of the nineteenth century, most of the painted vases discovered in Etruscan graves had been properly identified as Greek in origin, thus depriving Etruscan archaeology of a major field of study. This took place in the antiquarian sphere and soon received general acceptance. By 1850, very few vases were still credited to Etruscan workmanship. All that were left as Etruscan were bucchero, Etrusco-Corinthian ware, and red-figure vases. Not until 1947 did John D. Beazley publish the first corpus of Etruscan vase-painting.²³³

By what criteria, then, were Etruscan figure-decorated vases analyzed at that time? The calyx-krater of the Cabinet des Médailles was discovered in 1833 (quickly entering the Baron Beugnot’s collection) and published, one year later, by Desiré Raoul-Rochette, claiming to write the first real study of Etruscan painted vases.²³⁴ Etruscan features were first sought in the inscriptions that were integrated into the scenes and then in the style and the subject depicted. According to the author, the scene, representing Ajax slaughtering a Trojan prisoner, was typical of the taste for cruelty, bloodshed, and pain that Etruscans appreciated. To identify the subject on the other side of the krater—Charun greeting three dead women—the scholar compares

other Etruscan art as well as ancient texts: he clearly identifies Charun as the Etruscan demon of death, citing urns from Volterra; but for the woman on the right, identified as the Amazon Penthesilea by an inscription, he finds no text in ancient literature to explain the scene, which puzzles him greatly. This systematic reference to a text in order to interpret the image is another way of analyzing figure-decorated objects that would last long in scholarship.

As for wall painting from the necropolises of Etruria, the scholars of this period saw it as important evidence because there was no doubt as to its place of production (the paintings that cover the walls of the tombs were made on the spot) and it explained the beginnings of Etruscan art, its imitation of Greek art, and gave some idea of the appearance of lost Greek painting that is known only from the textual tradition. The first scientific edition did not begin until 1937, with the collection *Monumenti della pittura antica scoperti in Italia. Pittura etrusca*, complete catalogues appearing only after 1980.²³⁵ But as soon as they were discovered, the paintings were copied, as were mirrors and urns, given the additional problem that as soon as they were exposed, they quickly deteriorated.

The Tomb of Inscriptions in Tarquinia was discovered in 1827 by August Kestner, Otto Magnus von Stackelberg, and Joseph Thürmer, who immediately took charge of copying the paintings. Kestner published the monument almost immediately, interpreting the tomb as Etruscan work because of the rudeness of the forms, whereas the scenes depict rituals: the parade of horsemen and the pugilists represent the funerary games; the dancers, a procession for Dionysus (Fig. 6.1).²³⁶ This *realistic* thesis is explicitly opposed to a previous publication by Raoul-Rochette upholding an *eschatological* interpretation: the scenes illustrate the happy life in the hereafter gained by the deceased, who are depicted in the dance of wine, thanks to an initiation to Dionysus.²³⁷

This first period established the principal methods of research: constructing corpora of the artifacts, arranging them in series to understand their meaning (realistic or eschatological perspectives), taking into account their inscriptions, comparing them with ancient texts, and emphasizing Greek influence.

2Exegesis from the later nineteenth century to 1930

The first works of synthesis on the meanings of Etruscan figural scenes developed in the second period and involved intense scholarly debate.²³⁸ The widely read book by the French historian Jules Martha was published in 1889,²³⁹ in which he set down the main theories of the significations of tomb paintings. Martha distinguished two periods: before the third century BCE,

most of the scenes realistically depict the funeral ceremonies performed in honor of the deceased; they are represented in the tomb to attest to the piety of the dead's family and to grant him eternal happiness. From the third century on, the figure-decorated scenes take place in the underworld: the migration of souls, demons, and the deceased depicted as a hero justify this second eschatological approach.

Thus Martha links the Tomb of Inscriptions—belonging to the first period—to the iconography of funeral ceremonies: it depicts a horse race won by one horseman. The two sides of the calyx-krater, with the demon of death, would then relate to the second period: the women are depicted in the hereafter and the slaughter of the prisoner refers to a tragic death, in the presence of Charun waiting to ferry the soul.

Martha's interpretation very clearly set the terms of what was to become a dispute between the realistic and the eschatological readings, since scholars would soon be interpreting the scenes in funerary iconography of all periods as depicting the next world. This is the case of Fritz Weege,²⁴⁰ who states that tomb paintings represent the world of the dead from the Archaic period until the end of Etruscan culture. The only change concerns the tone of the scenes: beginning in the fourth century, the world of the hereafter is depicted as terrifying and dark, featuring dreadful demons like Charun, whereas it is filled with happiness in the Archaic period. This change was due to religious influence, Orphic and Pythagorean, coming from Magna Graecia.

Shortly after its publication, the book was sharply criticized by two scholars: the Dane Fredrick Poulsen upheld the realistic reading whereas the Dutch scholar Carel Claudius van Essen stated that the violent elements of the iconography from the fourth century had nothing to do with Orphism:²⁴¹ at that very moment, the Etruscans freed themselves from Greek culture, permitting a new language to arise.

3Mapping the workshops of Etruscan artifacts (1930–1960)

After the period of debate over the meaning of funerary iconography, the next three decades were marked by studies that probed the formal aspects of image. Inheriting the German approach of corpora and developing connoisseurship of vases, Beazley undertook the first complete classification of Etruscan figure-decorated vases, identifying the artists or workshops of more than a thousand items.²⁴² At the same time, several scholars treated wall paintings the same way: Franz Messerschmidt, Pericle Ducati, Ranuccio Bianchi Bandinelli, Luisa Banti, Massimo Pallottino and Giovannangelo Camporeale worked on the classification of the paintings, in order to map and date their production.²⁴³ Their creation was said to begin on the coastal cities

(Tarquinia) and then develop in inland Etruria (Chiusi). They also emphasized Greek influence on the Etruscan workshops: Corinthian, Laconian, Ionian, and lastly Attic.

Other corpora were studied as well: the relief stone monuments from Archaic Chiusi (urns, *cippi*), were gathered by Enrico Paribeni in the late 1930s,²⁴⁴ the figure-decorated stelae from Felsina in the Po valley²⁴⁵ and the Pontic vases (1932),²⁴⁶ by Ducati, to mention the main works that looked at workshop and formal aspects.

Thus, the style of the paintings of the Tomb of Inscriptions is related to the emigration of Ionian artists to Etruria, the workshop having also produced the Tombs dei Baccanti (of the Bacchants), del Morto (the Dead Man), dei Vasi Dipinti (the Painted Vases), and del Vecchio (the Old Man), according to Pallottino²⁴⁷.

As for the calyx-krater, Beazley attributes it to a period of decadence of vase painting, because of its coarse style. But against other scholars Beazley is ready to defend the quality of Etruscan art, and especially of violent scenes like the slaughter of the Trojan prisoner on the krater, a scene which actually comes from Greece and emphasizes the “heroic strain of the Etruscan character.”²⁴⁸ In analyzing the pattern of Ajax and the Trojan, Beazley compares it to several other monuments showing the same composition, but with Achilles, and proposes a Greek model. In the krater, the addition of Charun is an adaptation to the Etruscan beliefs; the different attitude of the victim is a variation from the Greek model; and the inscription indicating Ajax (*Aivas*) is a slip for *Achle* (Achilles). So again what is important here is to set down the dependence or originality of Etruscan forms with respect to the Greek forms.

Finally, by the end of the period, worldwide interest was excited by Erika Simon and Roland Hampe’s book on the question of Greek models, but interrogating the iconography. Examining the meaning of scenes on vases and bronze artifacts of the Archaic period, they reveal the Etruscans’ deep knowledge of Greek mythology.²⁴⁹

4New approaches to the meanings of images in the 1970–1980s: Social background, semiotics, and genealogy

In the late 1970s, several authors borrowed a methodology of analyzing images from archaeological studies, specifically concerning funeral data. The social reading of grave furnishings is associated with the anthropological concept of acculturation, another way to speak of influence, removing the problematic hierarchy between source culture (Greeks) and target culture (Etruscans).²⁵⁰ This sociological approach is well represented by Mauro

Cristofani, who shows how the funeral is a crucial moment in social life.²⁵¹ We can recognize in that moment a display of the social status of the deceased person, who has deployed very thoughtful strategies, including the production of images.

Another archaeologist, Bruno d'Agostino, has certainly taken this social reading of funerary figural representations the furthest.²⁵² The social reading is to take wall painting or engraved monuments included in the tombs as showing emblematic scenes of the life of the Etruscan lord, since the images remain a privilege of the aristocratic class. Those scenes are specifically designed to embody his social status. In the Tomb of Inscriptions, the *komos* (wine dance), and the *symposion* (wine consumption), are part of the worthiest activities and characterize, according to d'Agostino, the social and familial dignity of the deceased lord.²⁵³ We may also emphasize that different age classes are embodied by different activities: the horsemen in the left corner of the chamber represent the young men, the dancers with wine vases on the right, the adults.²⁵⁴ Thus in this interpretation, d'Agostino denies the realistic and "magico-religious" readings that recognize in Archaic-period scenes the different moments of the funerary rites or the future life in the underworld.²⁵⁵

In addition to this sociological view of images, d'Agostino has emphasized how French and Swiss scholars, such as Alain Schnapp, François Lissarrague, or Claude Bérard, have studied figure-decorated scenes using linguistic and semiotic principles.²⁵⁶ At the same time the "cité des images" was constructed for the figure-decorated vases produced in Athens, d'Agostino and, following him, Luca Cerchiali try to understand the language of Etruscan images by constructing series.²⁵⁷ For the Tomb of Inscriptions, d'Agostino tackles the interpretation of the doors that are painted in the middle of each wall in the tomb and are a common feature of funerary wall paintings.²⁵⁸ Between the two traditional explanations – the doors represent the possibility of enlarging the tomb with further chambers that had not yet been dug, or they symbolize death and the underworld²⁵⁹ – d'Agostino prefers the latter but adds the idea that they represent the deceased *ex absentia*: borrowing the notion of code-switching from the linguistic field, he sets an equivalence between the closed doors surrounded by various characters (dancers, musicians, pugilists, mourners) in different tombs, and the enormous krater in the Tomb of Lionesses flanked by the *aulos* and the lyre players. Like the doors, this vase represents the deceased *ex absentia*.

Lastly, the sociological and semiotic approaches go together with a renewal of the thesis that the Etruscans were very familiar with Greek culture, as Simon and Hampe stated. Recently, d'Agostino and Cerchiali have thus provocatively stated that "Etruria was a province of Greek culture."²⁶⁰ A good example is the case of the Greek *symposion*: although with some differences, it is borrowed by the Etruscan aristocracy in its more specific details, as comparison between Etruscan images and Greek epics shows.²⁶¹

As for mythological scenes, scholars also insist on the genealogical

interpretation of the myths illustrated. The characters depicted in the figure-decorated representations are connected with a discourse developed by the client claiming the Greek heroes as his ancestors.²⁶² Thus, the calyx-krater in Paris, with the slaughter of the Trojan prisoner, is interpreted genealogically:²⁶³ the presence of Ajax instead of Achilles is no longer considered a mistake, as Beazley claimed, but a choice of the purchaser of the vase who ordered for his tomb a special scene placing himself in the lineage of the Greek hero Ajax (Fig. 6.2).

This is confirmed by study of the inscriptions (an earlier inscription *Achle* has been found underneath *Aivas*) and comparison of the bearded Ajax with the other examples of this scene that always present Achilles as beardless.²⁶⁴

5 On rituals and beliefs in the 1990s and 2000s

The previous period of scholarship ended with a disruptive discovery: the Tomba dei Demoni Azzuri (Tomb of the Blue Demons) in Tarquinia, a discovery that was to bring about a return to the earlier studies of the religious aspects of iconography after the period of sociological discourse.²⁶⁵

The tomb was discovered in 1985. Dated to 440 BCE, it seems to be the first painted tomb that represents the demons of the underworld in a realistic manner: blue skin, red hair, and bloody mouth. The scenes are arranged to be viewed in order, from the front entrance of the tomb to the back. The scene with the demons is on the right-hand wall, and Francesco Roncalli has convincingly argued that it represents the passage of the deceased woman from right to left, across the rocks inhabited by the blue demons, toward the boat, where the boatman waits to conduct her to the world of happiness that she has been granted.²⁶⁶

Mauro Cristofani sets the monument in a moment of transition between two periods.²⁶⁷ First, before the middle of the fifth century, there is no representation of the underworld: instead there are either excerpts from the rituals, or scenes symbolizing the social status of the deceased. The second period is marked by the irruption of a realistic depiction of the underworld with its inhabitants, its demons, and a black cloud surrounding the scene: a suggestion not far from what was already understood by Martha.

This discovery has brought about in recent years a common line of research oriented toward the religious content of the images.²⁶⁸ Beliefs and dogma on the one hand, rituals on the other, are taken into account by scholars who have produced innovative readings. These new statements connect the images to ancient texts and to the architecture of the tomb (in the case of tomb paintings).

Concerning religious dogma, Roncalli refers to the literary tradition, unfortunately very late,²⁶⁹ of the Etruscan practice of divinizing sacrifices that

render the deceased equal to the gods by offering the blood of certain animals to certain deities. The architectural feature known as the console, which appeared, in the Archaic period, at the center of the pediment between fighting animals, recalls the shape of altars for sacrifice, the hunting of animals evoking the blood shed during sacrifice.

In the Tomb of Inscriptions, this specific “altar-console” is missing, but the tails of the two symmetrical lions, where the console would be in the middle of the pediment of the back wall, recall the volutes that adorn the console in other archaic tombs of Tarquinia.

Other contributions have studied the journey of the deceased to the underworld, a topic that had been forsaken since the social reading of images was undertaken. The argument concerns vases and funerary monuments of the Classical and Hellenistic periods, a point that doesn’t give rise to discussion,²⁷⁰ whereas for the Archaic period, the iconography remains ambiguous and the point is still at issue.²⁷¹ Those religious inquiries also stress the funerary role of deities, such as Dionysus, the Dioscuri, Hermes-Turms, and Orpheus, whose cult, according to some scholars, can already be discerned in images of the Archaic period.²⁷²

As for rituals, on the other hand, scholars have emphasized the location of the images inside the tomb. Their location bears a precise signification. According to Agnès Rouveret, the decorative system of the tomb painting (trees, tents, doors) corresponds to a practice, well known among the Etruscans, of cutting out and marking off some areas as sacred spaces.²⁷³ Arranging the tombs in a series, the author underlines the division into two groups of tombs in the Archaic period. In the first, the trees are combined with doors to adorn scenes of games, whereas in the second, the tents shelter banquet scenes. The Tomb of Inscriptions belongs to the first group: we see three false doors associated with the various games. This must thus be connected with a ritual organization of the paintings and the space in the tomb.

According to Mario Torelli, the ritual is displayed differently, though again through tomb architecture.²⁷⁴ What has permitted this new analysis is the discovery of the Tomb of the Blue Demons: there is a progression from the entrance of the tomb to the back wall that corresponds to the journey of the deceased to enter the underworld. Likewise in the Tomb of Inscriptions: the horsemen symbolize the journey toward the underworld. The cavalcade on the left and the procession of dancers in the right rear corner take place by the doors – a symbol of the path to the underworld: they are performed in an ambiguous space, between the world of the living and the world of the dead. The other scenes that happen before the doors in the two side walls are located on earth: games on the left, rewards of the games on the right, and in the entrance wall, funerary rituals of preparing food for the dead.²⁷⁵

This emphasis placed on the rituals is not exactly the same as the realistic or mimetic readings that see funerary ceremonies in the tomb paintings; here

the images directly participate in the ritual, since they are located in strategic places of the funerary space with respect to the ritual.

Fernando Gilotta finds the origin of the expression of this ambiguous time and place of Etruscan funerary iconography in Attic vase paintings,²⁷⁶ while Torelli tends to root the references to rituals in Etruscan and Italic ground. The inquiry into the meanings of the images is thus connected to their formal study, which again illuminates the links with the Greek world.

7 Approaches to the study of the language

Abstract: The process of decipherment of the Etruscan alphabet culminated in the groundbreaking work by Luigi Lanzi (first published in 1789), who for the first time employed the immense collection of Etruscan inscriptions assembled by Pietro Bucelli and acquired by the Florence museum. From 1789 on, it was possible to read all common Etruscan letters. Some rare graphemes of the Archaic period were finally deciphered only in the twentieth century, but this delay did not affect the study of Etruscan language, which Lanzi effectively started. One of the most notable achievements of Lanzi's work was the understanding of the most common features of Etruscan name formulae; since almost 90 percent of all Etruscan words known to us are personal names, this enabled scholars to understand at least the simplest epigraphic texts.

Keywords: Etruscan language, decipherment, bilingualistic method

1 In search of the Etruscan language

It was not until the end of the eighteenth century that the decipherment of the Etruscan alphabet seriously began. In the preceding centuries, only a small number of Etruscan inscriptions were known—often through inaccurate handwritten transcriptions. Moreover, the evidence that scholars knew as “Etruscan” included a significant amount of fakes and inscriptions in other languages (first of all, the “*tabulae Iguvinae*”). The “Etruscan alphabets” drawn by scholars before the last years of the seventeenth century included some letters that are actually nonexistent.

During the eighteenth century, the knowledge and understanding of Etruscan writing increased dramatically, and fakes and non-Etruscan inscriptions were gradually recognized. Many uncertainties persisted, however, especially concerning the various shapes many graphemes could present. The most striking example of the state of knowledge in this period is the fake inscription carved on the rock, which was the original location of *CIE* 8 before it was sawn off and carried to The Florence National Archaeological Museum. Its author would have known only a typographic transcription of the text, and transformed it again into Etruscan—or rather, what he assumed was Etruscan.²⁷⁷

The process of decipherment culminated in the groundbreaking work by Luigi Lanzi (first published in 1789), who for the first time, employed the

immense collection of Etruscan inscriptions assembled by Pietro Bucelli and acquired by the Florence museum. From 1789 on, it was possible to read all common Etruscan letters but one (the <z>, recognized by Lepsius in 1833). Some rare graphemes of the Archaic period (like the cross-shaped <θ> and <š>) were finally deciphered only in the twentieth century, but this delay did not affect the study of Etruscan language, which Lanzi effectively started.

One of the most notable achievements of Lanzi's work was the understanding of the most common features of Etruscan name formulae; since almost 90 percent of all Etruscan words known to us are personal names, this enabled scholars to understand at least the simplest epigraphic texts.²⁷⁸

2The pioneers

The possibilities opened by Lanzi's momentous decipherment were immediately exploited. The first modern etruscological handbook, published in 1828 by Carl Ottfried Müller²⁷⁹ included historical and sociological observations based on epigraphic evidence. Since knowledge of Etruscan language was limited almost only to personal names and name formulae, Müller made reference to inscriptions in a pioneering attempt to sketch the composition of ruling elites of Etruscan cities and the inner structure of the Etruscan family.

In the first half of the nineteenth century, scholars realized that further advances were not possible without new readings of all Etruscan inscriptions. Sketches and transcriptions published in older works were now recognized as mostly unreliable. Giovanni Battista Vermiglioli, Arcangelo Michele Migliarini and Giancarlo Conestabile della Staffa all contributed to the assemblage of partial *corpora* of Etruscan inscriptions (although Migliarini's work remained unpublished, and it is preserved today only in manuscripts). The task was finally accomplished by Ariodante Fabretti in 1867, with the publication of the *CII*, soon to be followed by three supplements (1872, 1874, 1878) and a further massive update conveniently called an "appendix" (*Appendice*) by Giovan Francesco Gamurrini in 1880. Fabretti collected inscriptions in all indigenous languages of ancient Italy, because he considered all of them dialects—or at least late developments—of one ancient "Italian" common tongue. This belief was widely shared by scholars at that time, and also served political and ideological purposes in the cultural framework of Italian "Risorgimento" (Fabretti himself was forced into exile from his native Perugia in 1849, and was later to become a senator of the [re]instated Italian kingdom).

The ponderous *Glossarium Italicum* accompanying the *CII* summarized all what was known at that time about Etruscan language. It was in some ways the first reliable

Etruscan dictionary, although it mirrored a state of knowledge that may seem rudimentary. In fact, after 1867, the distinction between scientific research and pseudo-scientific speculation on Etruscan language was finally drawn, and a decade or so later the study of Etruscan entered an entirely new phase. In 1874, Wilhelm Paul Corssen published a grand volume in which he applied the new achievements of linguistic science to Etruscan. Like many others in his time, he considered Etruscan an Italic language, and attempted to translate it through etymological methods.²⁸⁰ It was immediately followed by a tremendously incisive reply by Wilhelm Deecke,²⁸¹ to whom Corssen was unable to reply because he met a sudden and early death. Deecke pointedly noted inconsistencies in Corssen's work, and caused the etymological method to be put aside forever in the study of Etruscan language. He showed that all proposed affinities of Etruscan to other known languages did not seem safe enough to work with etymologies. On the contrary, each etymological series led inevitably to dead ends and sharp conflicts with the evidence. This is why he proposed a new method, which he called "kombinatorisch," according to which Etruscan linguistic evidence should be studied in itself, the translation of each word (or stem) being the result of a comparative study of its occurrences.

3The new generation at work

The new method quickly became the standard approach, and survived Deecke's later retraction of his assumptions about the affinities between Etruscan and Italic languages. In fact, both ideas (Etruscan as Italic and as non-Italic) remained alive in the following decades. However, the "combinatory" method was widely accepted by both parties. It was especially the four series published by Deecke and Carl Pauli (*Etruskische Forschungen*, *Etr. Studien*, *Etr. Forschungen und Studien*, *Altitalische Studien*) that contributed the most to the development of Etruscan language studies, alongside the work of many other scholars like Sophus Bugge, Alf Torp, Jules Martha, Gustav Herbig, Franz Skutsch and Elia Lattes. It is also important not to forget the important role of Gamurrini who, being an archaeologist rather than a linguist, focused especially on the material aspects of epigraphy.

One of the greatest achievements of this period was the publication of the *CIE*. It was a monumental enterprise, started and mostly realized—despite countless difficulties—thanks to Carl Pauli's stubborn commitment (Fig. 7.1). The project started as a volume of *addenda et corrigenda* to the *CII*, but it rapidly gained momentum, especially when Pauli involved Olof August Danielsson (Fig. 7.1). The actual aim of the project (an entirely new *corpus*, and not simply *addenda et corrigenda*) was kept secret, because Pauli was aware that it would cause troubles among Italian scholars, especially after

Lattes had announced a similar project of his own. In fact, the publication of the first fascicle in 1893 “seems at first to have caused consternation and disappointment.”²⁸² This and the subsequent fascicles were promptly and thoroughly reviewed by Bartolomeo Nogara, Lattes’ pupil and fellow worker. After the completion of the first volume in 1902, Lattes himself published an entire book of *corrigenda*.²⁸³ Curiously enough, he failed to highlight the actual weakness of the first volume of the *CIE*—that the authors had worked with little or no interaction with local archaeologists (professionals and amateurs alike), failed to make any research in public and private archives and did not include a complete set of bibliographical references, resulting in a disproportionate number of (supposedly) unprovenanced inscriptions, especially from the area of Chiusi. This was a fault never repeated in later volumes. Meanwhile, Danielsson was finally recognized as co-author by the late Pauli (d. 1901), and had become the director of the project together with Gustav Herbig. Both of them agreed to include Nogara as their co-worker.

In this same period, alongside the constant flow of new discoveries that systematically increased the number of known Etruscan inscriptions, a major new acquisition began to exercise its disrupting effects. In 1892, Jakob Krall recognised as Etruscan the text inscribed on the linen wrappings of a mummy preserved in the museum of Zagreb—a text that contained a great number of

words never attested elsewhere. Although its overall interpretation as a ritual calendar was generally accepted almost immediately after its discovery, a word-to-word translation appeared to be impossible (as it is still today).²⁸⁴

4In the dead end

The new editors of the *CIE* decided to modify the general structure of the work, following the most recent developments in epigraphic studies. The main innovation was in the distinction between *tituli* and *instrumentum*. Danielsson was in charge of the *pars prior* of the new *volumen alterum*, comprising the *tituli* of areas of Etruria not included in the first volume; Herbig received the general overview of a rather miscellaneous *pars posterior*. This includes all Etruscan inscriptions from outside Etruria (comprising *ager Faliscus et Capenas*), unprovenanced ones, *instrumentum* inscriptions from everywhere, and two *indices* (an *index vocabulorum* by Danielsson, and an *index librorum* by Herbig). Nogara had to cooperate with both Danielsson and Herbig.²⁸⁵ Danielsson succeeded in publishing two fascicles (in 1907 and 1923), while Herbig published two more, including one supplement devoted to the *liber linteus Zagrabienensis*, which had not been included in the original plan. Herbig's death in 1925 forced Danielsson to find a new co-worker. Ernst Sittig helped in the completion of the third fascicle of the *pars prior*, whose final publication Danielsson never saw.

In these same decades, the study of Etruscan language effectively reached, for the first time, a dead end. The preceding generation had exploited all the possibilities of the “combinatory” method. New discoveries could of course help to achieve further developments, but it was at the same time painfully clear that the major new discovery (the *liber linteus*) had created more problems than it had solved. Drawbacks of the method became increasingly evident. In search of a translation, the most subjective good sense supplied what evidence could not provide. Literature of the period until the World War II is full of “translations” which are almost useless to the present-day researcher.

The main focus of the research was to determine the position of Etruscan within the general classification of languages—and if it was Indo-European or not? Many of the proposed “translations” served to support one or another view, with a partial reprisal of the “etymological” method. A violent dispute arose between supporters of the different theories, with intermediate positions gradually emerging. One must not forget that in those decades, the classification of languages had profound political implications, and the dispute was not immune to ideological issues.

Completely outside this debate, and partially recognizing the futility of much of it, stood Giulio Buonamici, who focused mainly on the epigraphic

aspect of Etruscan inscriptions. His methods (like our own) owed more to the plain and rational positivistic approach of the preceding generation, rather than to his contemporaries' works.²⁸⁶ His thorough investigations of material aspects of inscriptions opened many new fields of research, and in fact prompted a restart of Etruscan epigraphic studies from the dead end they had reached. It is no accident that Søren Peter Cortsen's and Arthur Rosenberg's works²⁸⁷ about Etruscan society and government—focused on historical and epigraphical issues rather than on linguistic ones—were among the few from this period to be referred to continuously for many decades; linguistic studies were on the contrary quickly forgotten.

5A new beginning

In the years immediately preceding and following the World War II, something began to move. It became increasingly clear that the quest for a translation had led to self-referential works, and a new method was needed. Massimo Pallottino stressed the need to merge linguistic and archaeological data in the process of interpretation of Etruscan (Fig. 7.1). Linguists of the last generation (especially Emil Vetter) focused on understanding the structure of the language, instead of wasting time in highly speculative translations. This ultimately led to the introduction of the “bilingualistic” method, theorized by Karl Olzscha. Every inscription should first be understood in its cultural framework, with the help of similar inscriptions in other (understandable) languages from areas culturally related to Etruria. The translations ought not to conflict with the cultural evidence, and have to suit the grammatical structure previously identified.²⁸⁸

The dramatic increase of archaeological research in Italy from the 1950s onwards brought to light a great number of new Etruscan inscriptions, most of them funerary or proprietary ones. Knowledge of personal names consequently increased, and it became possible to give many names specific geographical and chronological coordinates. This led to a gradual definition of an Etruscan epigraphic research partially independent from linguistic issues, and more interested in historical and social topics. The reference book in this field of study was Helmut Rix's *Das etruskische Cognomen* (Fig. 7.1).²⁸⁹ In this same year, the then young scholar published a review article about Etruscan language, in which clearly emerged his dissatisfaction for the current methods. Further developments were left for times to follow.²⁹⁰

Meanwhile, the *CIE* project stalled. The last editor, Ernst Sittig, had little or no interest in its continuation, and in 1940 an agreement had been signed, which conferred to the Istituto di Studi Etruschi ed Italici (established at Florence in 1925, now Istituto Nazionale di Studi Etruschi ed Italici) the task to realize the fourth fascicle of *CIE* II, 1. It is not clear why Danielsson's

extensive preliminary work was known neither to Sittig, nor to Nogara, who was put in charge of this enterprise. In fact, Danielsson's sketches and notes reached Uppsala University unnoticed, and were only published in 2003.²⁹¹ The Istituto di Studi Etruschi promptly obtained a budget from the Italian government to accomplish the task, and a lot of work was made before the war disrupted the project.²⁹² Nogara's death in 1954 and the huge number of new discoveries from the extensive excavations raised serious doubts about the actual possibility to fulfill an ambitious plan like a *corpus* as it was intended. Also in 1954, Pallottino published the first edition of his fortunate *Testimonia linguae Etruscae*, in which he collected all known Etruscan inscriptions, including words other than personal names. In order to achieve an updated repertoire of all epigraphic evidence considered "useful" for the reconstruction of language, comprehensiveness was abandoned. This required managing hundreds of inscriptions rather than thousands, and was considered more appropriate to the possibilities of an era during which research was so intensive that a *corpus* could become outdated even before its publication.

6 From the Pyrgi tablets to the present day

The discovery of the Pyrgi gold tablets in 1964 arrived exactly when the study of Etruscan language was ready for new developments. During the 1960s, Olzscha's "bilinguistic" method, mostly shared by Pallottino, gradually developed into a more systematic research about Etruscan grammar. The clear distinction between almost certain, reasonably possible, and hypothetical translations was an important methodological achievement by Pallottino. Only the former can be employed for further developments; those in the second group require additional care. Mere hypotheses are all but useless outside of the specific context for which they have been guessed (and to some extent even within it). If it is not possible to understand an inscription completely, it is better to attempt to define the grammatical role of unknown words, and eventually the semantic field within which their significance should be, if they mean something about, for instance, the parts of a tomb, or of a temple building, or some rite, and so on. At the same time, others focused on archaeological and epigraphic issues, whose study had been greatly encouraged by the massive flow of new discoveries. The proper places for such developments were especially the entries of the *REE*, gradually recognized as an update of the *CIE*. This field of study, more properly called "Etruscan epigraphy," immediately appeared to offer many more possibilities than language itself. This is why Mauro Cristofani, the author of a book entirely devoted to such topics,²⁹³ was entrusted with the edition of the *REE* from 1966 on (which he held until his death in 1997), and the completion of the *CIE* volume II, 1, 4, abandoned twenty years earlier. This enterprise

required the financial and logistical cooperation of the Consiglio Nazionale delle Ricerche (CNR), which was the publisher of the *CIE* when it finally appeared in 1970. Meanwhile, a revised edition of Pallottino's *Testimonia* (1968) had appeared, and new discoveries contributed to open entirely new fields to epigraphic research, which gradually became much more fertile than had been thought possible.²⁹⁴

Etruscan epigraphy as we understand it now is born between 1968 and 1970. A series of conferences and various papers, especially by Giovanni Colonna, Mauro Cristofani, Carlo de Simone and Helmut Rix, gradually defined methods and targets of an entirely new discipline, which accomplished to some degree Buonamici's forty-year-old statement. Instead of attempting to obtain new (highly hypothetical, and almost useless) translations of untranslatable words, scholars began to employ what we do understand in Etruscan inscriptions to reconstruct social and political histories of Etruscan cities.²⁹⁵

The turning point finally came in 1978. Pallottino had decided to resume Lattes' attempts to index all known Etruscan words (like the index that was expected to be included at the end of the *CIE* per Danielsson's and Herbig's intentions, even though completion of the *CIE* in 1978 appeared unattainable in a short term, in the lifetime of the authors). Pallottino planned an entirely new work, called a *Thesaurus Linguae Etruscae* (*ThLE*); the immense card catalog, which was necessary to fulfill the task, was realized again thanks to the financial and logistical cooperation of the CNR, and filled three huge filing cabinets. The publication of the *ThLE* (which was to receive three supplements, before being completely renewed as a second edition in 2009) had far-reaching consequences. For the first time, all known evidence of Etruscan language was collected in a single volume, making it possible to study it without the need to waste a lot of time looking for inscriptions. Not surprisingly, the following decade saw the most important developments in the understanding of Etruscan, especially thanks to Rix, who focused primarily on the reconstruction of grammar. Some of his achievements—the recognition of the plural suffixes, the complete map of enclitic pronouns, and the discovery of the definite article—have completely changed our knowledge of Etruscan language. His method has been widely accepted by other scholars, who have contributed to further developments (among them, see Luciano Agostiniani's works on negative particles and on numbers). The new achievements, which made the complete and reliable understanding of most of the inscriptions possible, also propelled the study of Etruscan epigraphy, in what had gradually become a “trademark” of Italian etruscology, from Gamurrini, through Buonamici, to Cristofani, Colonna, and Adriano Maggiani and an entire generation of scholars employing the massive epigraphic evidence to reconstruct Etruscan history, society, religion, and political organization.

The *CIE* project has continued under Pallottino's inspiration, with the

Istituto Nazionale di Studi Etruschi ed Italici becoming the effective publisher. It enjoys a large cooperation with the CNR, especially on the part of Maristella Pandolfini, who realized the first three fascicles of a newly-introduced volume III, devoted to *instrumentum* inscriptions, which new discoveries had made too abundant to be accommodated into a single fascicle, as Herbig had hoped in 1907. In 1995, the care of the enterprise was transferred to the CNR. The new editor, Mauro Cristofani, published only one fascicle (II, 2, 2) before his untimely death transferred the responsibility to Maristella Pandolfini, who was joined by the author of the present chapter in 2003. Another two fascicles have been published since then, and four more are in progress.

Meanwhile, directed by Helmut Rix, the *ET* appeared in 1991. This “abridged” *corpus* has been extremely useful, although the criteria Rix chose make it extremely dangerous for people without really strong knowledge of Etruscan epigraphy. The assumptions that “Etruscan” is “what is included in the *ET*,” and that Etruscan inscriptions are actually always as Rix (and his fellow workers) read them, have misguided even skilled scholars. The 1991 edition is now outdated, and a new one is expected by Rix’s academic heir Gerhard Meiser.²⁹⁶

7 Challenges for the future

The study of Etruscan grammar, as developed by Rix and widely accepted in present-day scholarship, seems to have exhausted all possibilities offered by the evidence. This is also true for the research of a “translation” for Etruscan words, which descends from a correct comprehension of the grammatical structures of the lexical contexts in which any word is attested. Most proposals for new translations are highly hypothetical, and cannot be confidently used in further developments. To put it more plainly, if several translations for the same word are theoretically possible, there is no compelling reason to accept one or another of them, and any series of deductions based on one of these translations gets dangerously close to inconsistency. Even if some minor acquisition of translations, for instance, or facts of grammar is always possible, dramatic developments in these fields require new discoveries.

This is not to imply that the study of Etruscan epigraphy and language has again reached a dead end. Many other topics remain to be investigated. For instance, the process of the formation of family names, fifty years after Rix’s groundbreaking study, needs to be thoroughly re-examined, especially because the last half century has witnessed a dramatic increase in evidence of personal names, especially for the Archaic period. A recent paper by de Simone²⁹⁷ about the wide diffusion of phenomena of *falsche Abtrennung* in

suffixes of Etruscan family names—which is an entirely new perspective for the reconstruction of onomastic families—is a good example of what research can still achieve. Epigraphy in its broader sense, including archaeological, historical and sociological issues, is far from having exhausted all possible developments.

The fiercest debate in present-day Etruscan epigraphy concerns methodologies of realization of epigraphic *corpora*. The traditional *CIE* (whose standard is followed by the *REE* and the *ThLE*), as we have seen, has been joined in 1991 by the innovative *ET*. This has led to a methodological dispute clearly beyond the purposes of their authors, who intended their work only as an easy-to-use repertoire of all known Etruscan inscriptions. The work does not imply the uselessness of all preceding editions, especially as regards the archaeological data related to inscribed items, which the *ET* contain only in a drastically abridged form.

One of the two main issues concerns the transcriptions of Etruscan sibilants. The traditional system is a plain transliteration of Etruscan graphemes. The new method first employed in the *ET* implies a phonetic interpretation; the “plain” sibilant is transcribed *s*, and the “marked” (maybe palatal) sibilant is transcribed *σ*, with diacritics showing the grapheme actually used. This system raises some questions. Interpretive transcriptions require reliable knowledge of the phonemic value of each grapheme, which is not the case with Etruscan. The basic scheme (south Etruscan <s>=/s/; <ś>=/σ/ vs. north Etruscan <s>=/σ/; <ś>=/s/) does not work with enough regularity to support a phonemic interpretation of *all* Etruscan words, only of *most* of them. There are some cases that escape any interpretation. This is especially true for some archaic inscriptions from Caere, Veii, and neighboring areas, where a graphic differentiation between the two sibilants appeared strikingly late. How to interpret, for example, the fragmentary inscription from Rome *CIE* 8601 (*ET* La 2.2), *uqnuś*[? If we assume the ending is complete, and thus the word is—as it seems—a personal name inflected in the genitive case, the sibilant will be /s/; but we cannot be sure. It is equally possible that it was, for example, *uqnuś*[*a*], consequently interpreting the sibilant as /σ/. Moreover, personal names ending in <s> retain this same sibilant grapheme in northern as well as in southern Etruria. How can we interpret them? With good reason, Rix supposed that these personal names always ended in /s/, and that the (anomalous) northern spelling was a consequence of southern influence.²⁹⁸ Agostiniani, on the other hand, with equally good reason, holds that this ending should be interpreted as /s/ in the south, and as /σ/ in the north, thus reflecting dialectal differences between the two areas.²⁹⁹ Other personal names, like *sentinate* and the *śatna/satna* series, raise similar questions.

The main argument supporting the interpretive transcription of Etruscan sibilants (northern and southern spellings of the same words are easier to find in a word index) seems to disguise an ideological crusade against traditional *corpora*. This is because, for instance, nobody thought to suggest a similar

method to transcribe the voiceless velar /k/, represented by as many as three different graphemes (their phonetic interpretation, at least, is certain). Ideological crusades are worthless in the scientific debate. The necessary conditions for an interpretive transcription of Etruscan sibilants (a reliable interpretation of all—or nearly all—sibilant graphemes in Etruscan inscriptions) are still lacking.

Another issue put forward by the edition of the *ET* is how much information should be included in each entry. The *CIE* volumes (and the *REE*, working theoretically as its update) require a comprehensive gathering of all data available and thorough updates (for example, about the archaeological context, or about chronology, especially if previous publications are heavily outdated). Moreover, an apograph is always required, with the obvious exception of lost inscriptions recorded only in typographic transcription. Collecting so much information requires a large amount of work, including archive and bibliographical research, autoptic documentation in museums and collections, and so on. As a result, each volume needs many years to be completed, and the *CIE* (like all great *corpora*) is likely to be always incomplete or at least partially outdated. At present, five fascicles are still lacking, and about three quarters of what has been published requires substantial updating. The *ET*—which the authors conveniently called an *editio minor*—only include some basic information about the texts, and no apograph at all, making it impossible to handle palaeographical issues or evaluate how much of any suggested reading relies on the interpretation of the authors rather than on the material evidence. This enables the authors to realize an almost complete collection of all known Etruscan inscriptions in a reasonable time span. But such a collection can be confidently used only by scholars with very good knowledge of Etruscan epigraphy—in its archaeological and linguistic aspects—who are thus able to find all lacking data by themselves. In fact, any study making use of Etruscan epigraphic evidence should imply that its author knows as deeply as possible all aspects of every inscription referred to. It would be highly unsafe, for example, to draw conclusions employing a single text that ultimately would reveal itself, for example, only as an interpretation of a somehow confused seventeenth-century sketch, no matter the authority of the scholar who proposed it. The simple entry of *ET* Cl 2.8, which informs the reader that the inscription is on a “vase,” conceals the fact that the vase itself contained the cremated remains of an individual, and that the inscription can be interpreted as a funerary as well as a proprietary one—the difference matters. The only advantage the *ET* offer in comparison to the plain word index of the *ThLE* is that all texts appear in full. In both cases, users have to check all archaeological and epigraphic data of every single inscription they need to refer to.

8DNA and Etruscan identity

Abstract: From the time of Herodotus, who suggested that the Etruscans were immigrants to Italy, to the present day, the origin of the Etruscans has been debated. Since the mid-twentieth century a convincing academic consensus has been built that the Etruscans were an autochthonous people. The development of molecular archaeology, investigating ancient biological molecules, particularly DNA, has brought new evidence to the debate. This area is still developing and many of its findings are experimental or provisional.

Keywords: Etruscan origin; DNA; molecular archaeology

Introduction

From the time of Herodotus—who suggested that the Etruscans were immigrants to Italy—to the present day, the origin of the Etruscans has been debated.³⁰⁰ Since the mid-twentieth century a convincing academic consensus has been built that the Etruscans were an autochthonous people. The development of molecular archaeology, investigating ancient biological molecules, particularly DNA, has brought new evidence to the debate.³⁰¹ This area is still developing and many of its findings are experimental or provisional.³⁰²

1The search for Etruscan DNA

A fundamental feature of gene distribution in Europe is a gradient of variability from high diversity in the southwest of Asia toward lower diversity in the northwest of Europe.³⁰³ This gradient is thought to derive from the Neolithic colonization of Europe after the last Ice Age when much of Europe was depopulated.³⁰⁴ The variability in the mitochondrial DNA (mtDNA) in modern samples from southern Tuscany lies between these extremes.³⁰⁵ Assuming some degree of continuity between the modern Tuscan and Etruscan population,³⁰⁶ this observation suggests that the Etruscan population was descended from the Neolithic population, which would be consistent with the hypothesis that the Etruscan language is a relic of pre-Indo-European times and with the current archaeological consensus of an autochthonous origin. Subsequent research has sought to identify genetic material distinct

from this generalized Neolithic “background” that might be related to a distinct Etruscan ethnicity, whether autochthonous or immigrant. A further challenge for studies using contemporary genetic variability is that it is associated with contemporary linguistic and geographic variability and the distribution of recent social groups.³⁰⁷ This means that contemporary samples from Tuscany will have patterns of variability generated by their geographic, linguistic, and social origins and contacts, irrespective of any relationship to an ancient Etruscan ancestry.

Since about 2000, the study of population genetics has made significant advances in its methodology, particularly in the adoption of statistical techniques to interpret laboratory findings, the development of computer simulation techniques to model population histories, the extraction and analysis of ancient DNA, and the development of techniques that can analyze sections of the genome that are larger than the single molecules that were the focus of earlier studies.³⁰⁸

The first major investigation of the Etruscans analyzed eighty samples of bone from ten cemeteries in Etruria along with samples from Adria in the Po Valley and Capua in Campania.³⁰⁹ The investigation sought to answer two questions. (1) Were the Etruscans a biological population or just people who shared a culture but not ancestry? And (2) what is their relationship to modern populations and are they linked to other Eurasians?³¹⁰ The first question is interesting because it directly addresses a basic assumption: that the Etruscans were a people. This assumption is rarely questioned in Etruscology; after all, the Roman sources identify the Etruscans (the *nomen Etruscum*) as a group, even if they are then subdivided into the *duodecim populi Etruriae* (twelve peoples of Etruria).³¹¹ The research group led by Vernesi found that the internal genetic diversity in the Etruscan DNA was low, comparable to that in modern European populations, and not distinct, meaning there is no clear Etruscan “genetic fingerprint” that could be detected. The research also suggested that the Etruscan samples had a shared set of ancestors,³¹² and this is consistent with the existence of the gentilicial system of family structure based on blood lines that is directly observable in Etruscan personal names and in the sharing of family chamber tombs over several generations that became widespread from the Late Orientalizing period onward. Genetic relationships between individuals from the same chamber tomb have also been demonstrated using mtDNA evidence at Tarquinia.³¹³ At a more general level, the findings are consistent with Etruscan autochthony, since cultural and settlement continuity from the Late Bronze Age to the Etruscan period would generate a shared ancestry extending over at least ten generations.

2Etruscans and modern DNA

The second question, posed by Vernesi and colleagues, of the relationship between the genetic diversity in the ancient DNA from Etruria and the genetic diversity observed in modern populations, aimed to investigate any genealogical or emigrational links between the Etruscans and other Eurasian populations. The results were not decisive: the samples were found to have less genetic resemblance to modern Tuscans than there is resemblance between randomly chosen modern European populations.³¹⁴ Analyses of the shortest genetic difference between the (Etruscan) samples and modern populations found them closest to Tuscans, with Turks, other Mediterranean peoples, and the Cornish (from the southwest of England) following. Assessment of the mix of genetic material in the samples (admixture coefficient)³¹⁵ suggested that Etruscans are more closely related to Turks and North Africans than to Basques and northeast Europeans, and that the samples were more likely to have components of Turkish or North African DNA than samples from Tuscans, southern Italians, or Sicilians. The conclusion drawn was that the findings support an autochthonous origin for the Etruscans, inasmuch as their DNA is similar to that of other Europeans, but without excluding some component of female-derived DNA originating in the eastern or southern Mediterranean. This study was subsequently criticized for technical and methodological reasons, including the origin of the samples in old, possibly contaminated museum collections;³¹⁶ however, this need not invalidate tentative conclusions despite the hazards involved in being certain that the DNA identified is authentically ancient.³¹⁷

The tentative observation that Tuscans have the shortest genetic distance from the Etruscan ancient DNA (aDNA) has been further investigated by attempts to simulate population histories that could have led to the degree of relatedness between Etruscans and Tuscans that was observed by Vernesi's group.³¹⁸ This work concluded that the Tuscans are largely descended from non-Etruscan ancestors.³¹⁹ Projecting the simulations backward in time suggests that the genetic lines of the Etruscan samples emerged in the early Neolithic ca. 5500–4000 BCE (coalescence), a hypothesis consistent with an unbroken sequence of cultural development.³²⁰

Contrary to these studies, principal component analysis comparing 322 samples of modern Tuscan DNA with samples from other parts of western Eurasia found that Tuscan mtDNA has many affinities with European DNA but samples from Murlo had a higher proportion of haplogroups that are commonly found in the Near East.³²¹ Eleven haplotypes in the Tuscan samples were not found in 10,589 samples from Europe, including Italy, but were found in samples from Near Eastern populations spread from the Levant through Jordan, Mesopotamia, Iran, and the Caucasus, with one in Turkey. The findings indicate post-Neolithic, genetic input from the Near East to the present-day population of Tuscany.³²²

A subsequent, more detailed study of 258 samples from Tuscany has identified that approximately three percent of these contain typical Near

Eastern haplogroups, significantly reducing the proportion estimated by Achilli and colleagues in 2007.³²³ Other studies have also identified a link between modern Tuscan and Anatolian DNA but suggested that the two populations divided at least as far back as the Neolithic Period.³²⁴

An alternative approach to identifying intrusive populations is to identify a restricted geographic distribution of a gene mutation and then attempt to chronologically reconstruct the history of the mutation of that gene to provide a date for the first occurrence of that mutation. In Tuscany, nine of fifty-three samples from Elba contained a distinct mutation (U7a2a subsequently renamed U7b1) of a haplotype most commonly found in southwest Asia, with a distribution centered in Iran.³²⁵ The occurrence of this mutation has been tentatively dated to 750 BCE–950 CE, which could indicate the arrival of a Near Eastern immigrant carrying the mutation in the Etruscan period. However, the date range is wide and many other historical scenarios could easily account for the presence of this material in Italy.

Yet more recent work, using genome-wide, rather than maternal mtDNA, has identified a component of near eastern DNA in Tuscan samples, estimating that the genetic material mixed into the pool between 600–1100 BCE. Once again, as the authors note, these are estimates and various historical circumstances may have led to the formation of the observed dataset. Likewise, from an archaeological point of view, eastern genetic material in Italy is not to be unexpected in that period, and does not do anything to prove migration from Anatolia to Etruria. One new element of the study is the identification as the Caucasus as the area with the most closely related DNA to Tuscany, as an ancestral location this would seem, on the face of it, to be historically unlikely.³²⁶

3Italian cattle DNA

A study of DNA from eleven rare breeds of Italian cattle identified Near Eastern haplotypes in Tuscan breeds,³²⁷ and this led to a hypothesis that the cattle arrived in Tuscany with Etruscan settlers in the Late Bronze Age. Earlier studies of cattle DNA also detected genetic variation in European cattle that can be associated with southwest Asia, where *Bos taurus* was originally domesticated. Those studies also identify the highest levels of alleles associated with *Bos indicus* (zebu) in Italian cattle and relatively high levels of them in Greek cattle, and these are said to derive from cultural associations between Anatolia, Greece, and Italy over the past three millennia.³²⁸

A more comprehensive study concluded that the cattle originating in the Neolithic in the Near East also have mtDNA deriving from North African cattle and wild aurochs; it presents a circum-Mediterranean distribution of

cattle DNA illustrating that the African (T1) and Near Eastern (T and T2) haplotypes are found around most of the northern shores of the Mediterranean, making the Tuscan cattle less of a special case that could be associated with a hypothetical migration of (Etruscan) people from the Near East.³²⁹

4Conclusions

Given the Neolithic colonization of Europe, it is to be expected that Tuscan, or indeed Etruscan, DNA should contain haplotypes characteristic of southwest Asia. The Tuscans or Etruscans occupy a position on the clines of various distributions of haplotypes, just like any other European population. There have not yet been enough studies to reliably distinguish a Tuscan combination of haplotypes as distinct from other combinations in Italy, even if it is now possible to separate northern Italian samples from Bergamo from Tuscan samples.³³⁰ Even if the arrival of southwest Asian haplotypes could be dated to ca. 2,800 years ago, this would not confirm that the Etruscans were immigrants, because we already know that people moved around the first-millennium Mediterranean, either as immigrants or as groups of Greek or Phoenician colonists. Traditional archaeological techniques find it challenging to convincingly identify intrusive alien individuals, but ethnic diversity is indicated by the presence of foreigners, particularly Sardinians, in cemeteries in Etruria from the tenth–ninth centuries onward,³³¹ and there is plentiful evidence for cultural and economic exchange in the subsequent Orientalizing period³³² that has led to the suggestion of Near Easterners in the elite of Etruria³³³ and provides a plausible context for genetic exchange to occur. Mythistorical accounts, new artistic styles or uses of materials, and personal names occasionally suggest the movements of people³³⁴ and also occasionally suggest a non-Etruscan origin of individuals, who are usually assumed to be males. The mtDNA evidence indicates there was also immigration of childbearing females across the Mediterranean, possibly in the Etruscan period.

None of the DNA studies to date conclusively prove that Etruscans were an intrusive population in Italy that originated in the Eastern Mediterranean or Anatolia. Likewise, none conclusively prove that Tuscans are descended from Etruscans. On balance, there are indications that the evidence of DNA can support the theory that Etruscan people are autochthonous in central Italy. The absence of decisive results derives from the fundamental fact that archaeological ethnicities do not neatly map onto patterns in genetic diversity. Studies of modern genetic variation mapped with socio-cultural categories can demonstrate correlation between the two,³³⁵ but the time-depth of the archaeological perspective creates complex layering in genetic diversity as

population dynamics change, populations relocate and intermingle over time.³³⁶ The genetic diversity of the ancient people we identify as Etruscans, will have been a complex mix of genetic material deriving from western European, south west Asia and neighboring areas. Unraveling that mix, and relating it to the socio-cultural development of archaeological societies is an exciting challenge for both archaeogeneticists and archaeologists.

9Political organization and magistrates

Abstract: In the last few decades of the eighth century BCE and even more so in the first few decades of the seventh, the role of the Etruscan elites grew further, part of an overall process of social restructuring along aristocratic lines linked to the urbanization already in progress. Archaeologically, the allusions to the “princely” status of the most eminent members of the Etruscan elites of the Orientalizing period are consistent with the information provided by the literary sources, which describe Etruria’s most ancient historical phase as monarchical. The reconstruction of Etruscan political structures and organization in the seventh to sixth centuries BCE should, in the first instance, be conducted with reference to the individual local contexts: Etruscan cities were autonomous political entities whose authority extended to the surrounding area (city-states). In the current historical interpretation, the period from the last decades of the sixth to the first decades of the fifth represents a long phase of transition, by the end of which the Etruscan cities (or at least most of them) had abandoned monarchical regimes in favor of some form of republican order. The archaeological evidence (above all, the Etruscan inscriptions of the fourth to the second centuries BCE) enables us to reconstruct some aspects of the magisterial system in force in the Etruscan settlements of the time. Etruscan literary and epigraphical sources also make mention of the existence of a (con)federal-organism encompassing the twelve *populi* of Etruria.

Keywords: Kings, magistrates, city

Introduction

For the most ancient phases of Etruscan history, our knowledge of the forms of political organization adopted by the individual communities is essentially based on data derived from archaeological evidence, especially from funerary contexts. It is only in the late seventh century BCE that Etruscan inscriptions begin to yield data of institutional interest. The few indications in the literary sources of the political structure and organization of Etruscan towns in the seventh to sixth centuries, especially concerning the existence of monarchical regimes, are generally of the annalistic type, and as such their reliability needs to be carefully assessed. Indeed, it is important to consider the difficulties experienced by the ancient authors in verifying and describing the events of the past solely on the basis of annalistic data, together with the considerable period of time separating the facts from their annotation in the primary sources. The composite and often artificial character (especially regarding the earliest phases) of the ancient historiographical reconstruction would not, however, seem to invalidate the basic historicity of the data on which it is founded. This would seem to be confirmed by what is known of the Etruscan

world through other channels (i.e. archaeological evidence).

However, the difficulty in reconstructing the most ancient phases of Etruscan political organization does not stem solely from a problem of documentation. It should also be borne in mind that the “political” dimension, as it is commonly perceived today, only began to emerge in the Etruscan world in its autonomous, fully fledged “institutional” form when the seventh century was well under way. The earliest archaeological evidence of this development, especially epigraphical data, dates from this period. Associated with processes of urbanization and the acquisition of literacy, it is seen throughout the various regions of Etruria. The case of Tarquinii (Civita di Tarquinia), with its associated problems of interpretation,³³⁷ clearly illustrates the difficulties inherent in describing situations where the various structural components (be they “political,” “religious,” “economic,” etc.) of a social system appear to be closely intertwined. These difficulties appear even more evident if one considers that the local social system of Tarquinii has one of the highest degrees of structural and functional differentiation of all the Etruscan towns.

The reconstruction of Etruscan political structures and organization should be conducted with reference to the individual local contexts: Etruscan cities were autonomous political entities whose authority extended no farther than the surrounding area; they may be compared to the Greek city-states (Gk. *poleis*)³³⁸. The distinctive form of political organization in the Etruscan world was the city-state, and each community had its own institutional development.

One factor they had in common, highlighting the alliances between them and their ethnic solidarity, is the existence, cited in the literary sources, of a federal organism encompassing the entire *nomen Etruscum*: ancient tradition portrays this as an Etruscan League (see below, [section 4](#)).

1 Orientalizing and Archaic Periods

1.1A “princely” society

In the course of the eighth century, the process of “socio-political” development within the Villanovan communities³³⁹ seems to have generated significant and stable forms of socio-economic differentiation. These no longer affected individuals only but were extended to the other members of the family unit, depending on their degree of integration, based in turn on their family background. In other words, heredity of rank seems to have become an established principle. This is most evident in those areas (southern Etruria and Po valley Etruria) where proto-urban formation processes were most advanced and the local communities were more cohesive. The “socio-political” organization of those communities, whose leaders were members of

the local elites, thus followed models which the social sciences (particularly anthropology) have described, in neo-evolutionist terms, as pre-state (*chiefdom*) or proto-state (*early state*) entities.³⁴⁰

In the last few decades of the eighth century and even more so in the first few decades of the seventh, corresponding to the most ancient phase of the Orientalizing period, the role of the local elites grew further, part of an overall process of social restructuring along aristocratic lines linked to the urbanization already in progress. The exponents of these dominant social groups, whose power and privileges were founded on the possession of land, goods, and the means of production, seem to have gradually taken on the role of *principes*. Archaeologically, this is shown above all by the richness of their grave goods, among which were large quantities of luxury and prestige items including imported products. The exhibition of their wealth and power frequently made use of forms and symbols taken from oriental and Homeric royal models.³⁴¹

1.2 Kings of Etruria

These clear allusions to the “princely” status of the most eminent members of the Etruscan elites of the Orientalizing period are consistent with the information provided by the literary sources, which describe Etruria’s most ancient historical phase as monarchical. As well as with Rome, the monarchical traditions are associated most closely with the cities of southern Etruria. Monarchical forms (if they may fairly be considered such) seem to have been particularly strong in Veii, a city for which the ancient authors provide the names of a whole series of kings with mythological characteristics. Vibe is said to have had dealings with Amulius, mythical king of Alba Longa (Festus *Gloss. Lat.* 334); Thebris is the namesake of the Tiber River (Varro *Ling.* 5.30); Propertius is said to have sent a group of young colonists from Veii to found Capena (Serv. *ad Aen.* 7.697); and Morrius is said to have founded the priesthood of the Salii (Serv. *ad Aen.* 8.285). Of undisputed historical authenticity is the figure of Lars Tolumnius,³⁴² explicitly referred to as *basileus rex* of Veii,³⁴³ whose noble lineage, in its Etruscan form (*Tulumnes*), is seen in Etruscan inscriptions of the seventh to sixth centuries discovered in Veii.³⁴⁴ Recognizable in battle by his clothing (*regio habitu*; Livy 4.19.2), the king is said to have been killed by the Roman military tribune Aulus Cornelius Cossus in 437, who dedicated his remains (*spolia opima*) to the temple of Jupiter Feretrius on the Capitoline Hill (Livy 4.20.1 ff.). It was only after the death of Lars Tolumnius that the people of Veii adopted a republican form of government, which, was abandoned shortly afterward in 404 (or 403), if Livy is right in asserting that *Veientes contra taedio annuae ambitonis, quae interdum discordiarum causa erat, regem creavere* (Livy 5.1.3). Their choice cost them the opprobrium of the other

Etruscan *populi* (Livy 5.1.6), who declined to support them in their struggle against Rome (which finally conquered Veii in 396).

Monarchical traditions are also attested in Caere, associated both with rulers that were probably of the “tyrannical” type (Mezentius, Thefarie Velianas) and with later figures of the fourth century. As king of the Etruscans (“he who reigned over the Tyrrheni”), ancient tradition also mentions Arimnestos, who is said to have dedicated *ex voto* a throne in the sanctuary of Zeus in Olympia —the first barbarian to do so (Paus. 5.12.5). The circumstances and the motives for the dedication of an object that was so highly symbolic of power (*insignia imperii*) remain unknown. Of equal uncertainty is the chronology of the episode, dated by some³⁴⁵ to the Orientalizing period (due to the type of offering, a possibly wooden throne), and by others³⁴⁶ to the late archaic period (also ascribing the offering to a sovereign of one of the Etruscan cities of Campania). In any case, that it was not an isolated case seems to be shown by the probable dedication of Etruscan thrones in Olympia³⁴⁷ and an Etruscan *diphros* (perhaps a *sella curulis*) in Delphi.³⁴⁸

Monarchical traditions are also found in other Etruscan cities, even in the northern area such as Arretium (ruled over by the Cilnii, the *gens* from which Maecenas descended),³⁴⁹ although it is not known how far back in time they originate. They were also present in Rome, where the dynasty of Etruscan kings (Tarquinius Priscus, Servius Tullius, Tarquinius Superbus) gave rise to what the famous Italian philologist Giorgio Pasquali described as the “great Rome of the Tarquinii.”³⁵⁰ The personal name of the first of the Tarquinii (Tarquinius Priscus) is associated with one of the most ancient traditions referring directly to the existence of kings in Etruria. According to Servius, a late commentator on Virgil’s *Aeneid*,³⁵¹ the term *lucumo* was the Etruscan word for *rex*. However, according to some ancient authors,³⁵² *Lucumo* was also the original name of the future Tarquinius Priscus. Born in Tarquinii from the union of the Corinthian exile Demaratus and a local noblewoman, he is said to have changed his name to Lucius after moving to Rome.³⁵³ According to other sources, *Lucumo* (or *Lycmon*) was the name of an Etruscan leader allied with Romulus in the war against the Sabines,³⁵⁴ and an eminent personage from Clusium who lived at the beginning of the fourth century.³⁵⁵ In addition, *lucumo* is attested as a personal name (especially as a *praenomen*, but also as a *nomen* or *cognomen*), in Etruscan epigraphical texts of the fifth to second centuries, with the forms *Lauchume* and *Lauchme*.³⁵⁶ Scholars have thus deduced that this is a late tradition, interpretable as the conversion of a personal name to an institutional term.³⁵⁷

In this context, the ancient sources highlight the role of the Etruscan lady Tanaquil, the wife of *Lucumo* / L. Tarquinius Priscus, as the “*faiseuse de rois*,”³⁵⁸ in reference to both her husband and his successor, Servius Tullius. The woman is said to have woven the *toga regia undulata* that was subsequently worn by Servius Tullius with her own hands.³⁵⁹ The latter’s

daughter, Tullia, wife of Tarquinius Superbus, is said to have played a similar role to that of Tanaquil in predicting the royal destiny of her husband and in facilitating his rise to the throne, to the point that, according to Livy (1.48.5), *regemque prima appellavit*.

As in the case of the Tarquinii, the rise of the Etruscan kings and magistrates was accompanied by auguries of power (*omina imperii*). Some authors³⁶⁰ record the extraordinary destiny reserved for those leaders who were struck by lightning in the exercise of their functions as *rex*, or plausibly as magistrate (*princeps civitatis*) and yet survived. However, in the Etruscan tradition, *omina imperii* were also indicated by other celestial phenomena or by certain animals. *Fulmina regalia* were defined by Aulus Caecina as those lightning bolts that struck the forum, the *comitium* or the main public places of a free city (as in the case of Rome), warning of the threat of monarchy (Sen. *Q. Nat.* 2.49.2). Macrobius³⁶¹ notes that even the color of the coat of sacrificial animals (rams, goats) was useful in this regard: if the hide had golden or purple patches, great fortune lay in store for the *princeps*. This form of augury, cited in the *libri Etruscorum*, is also to be found in the *liber Tarquitii* (*scil.* Tarquitii Prisci) *transcriptus ex Ostentario Tusco*. For other ancient authors, certain animals had a special symbolic value in terms of royalty. According to Pliny the Elder (*HN* 11.18.55), bees were considered an ill omen in that they were a symbol of monarchy, while Servius affirms that doves provide auguries only to kings, since, like them, they never travel alone (*ad Aen.* 1.393).

According to late testimony by Macrobius (*Sat.* 1.15.13), the Etruscan kings regularly gave audiences and made decisions on questions of public interest every eight days.

1.3 Symbols of power

To these traditions may be added those relating to the Etruscan origin of the symbols of power associated with Roman kings and magistrates (*insignia imperii*). In recent years this issue has been the object of renewed attention on the part of researchers,³⁶² partly as a result of important discoveries such as the group of bronzes (*lituus* trumpet, axe, shield) discovered in Tarquinii (Fig. 45.2).³⁶³

The ancient authors' accounts of royal clothing and symbols among the Romans show some discrepancies: Dionysius of Halicarnassus, who provides the most exhaustive list, mentions the golden crown,³⁶⁴ scepter with eagle, ivory throne, tunic and cloak in purple (identified with the *tunica palmata* and the *toga picta* worn by victorious Roman leaders during triumphs), and the staffs and axes borne by twelve lictors. Other authors also mention the *bulla aurea*, trumpets, spears, and other items. All appear to basically agree in attributing their origin to the Etruscans, either to Etruria and its twelve *populi*

generally or to Tarquinius in particular.³⁶⁵ The Etruscans are said to have passed these *insignia* to the Romans in the time of Romulus³⁶⁶ or Tarquinius Priscus.³⁶⁷ Subsequently, these symbols and items of clothing, except the golden crown and the *tunica palmata*,³⁶⁸ passed to the Roman magistrates. These symbols and items of clothing were retained by Rome in adherence to an explicit tendency to elevate the symbols of power to sacred status, and even to propose a divine origin for them, achieved by associating them with the city's most important divinity, Jupiter Optimus Maximus Capitolinus. The cult statue of the god, commissioned by Tarquinius Priscus and created by Vulca, a sculptor from Veii,³⁶⁹ was kept in the central cella of the temple on the Capitoline. It showed the god seated on a throne, with a bundle of lightning bolts in his right hand, wearing the clothing and *insignia* typical of Etruscan royalty, which were later worn by Roman generals on the occasion of triumphs.

In contrast, the isolated testimony of Silius Italicus claims that the Romans derived their magisterial *insignia* (*sella curulis*, *toga praetexta*, military trumpets, lictors' fasces) from Vetulonia, at an uncertain date (*Pun.* 8.483–488). The reference to Vetulonia has often been linked to the discovery of certain items in the settlement's necropolises, such as the Late Orientalizing funerary stela (late seventh century) of Aule Feluske, which shows a warrior armed with a double-headed axe,³⁷⁰ and the bundle of rods with a double-headed axe discovered in the Tomb of the Lictors (630–620 BCE).³⁷¹ The latter is the only known example of its kind for Etruria. As was subsequently the case with the “Roman” fasces, the rods (symbolizing the *imperium domi*, i.e. power in the urban context) and the axe (alluding to the *imperium militiae*, i.e. power in the military context) are clearly associated, although elsewhere in Etruria they are always separate.

In addition, Etruscan contexts abound in other objects of clear ideological and symbolic value, such as the *hasta*, considered to be the *summa armorum et imperii*,³⁷² and the *lituus*, representing an *imperium* based on the correct interpretation of the divine will.³⁷³

In the archaeological evidence from the Orientalizing and Archaic periods, this ideology of power, particularly royal or “princely” and aristocratic power, is expressed most clearly in a series of artifacts (ceramics, architectural terracottas, funerary sculptures, objects in ivory, etc.) that convey figurative cycles and programs. In the last few decades, these have been the object of iconographic analyses and iconological interpretations that have generated much debate.³⁷⁴ Of considerable importance in this context are the emphasis on genealogical data and the use of Greek myths for ideological and propaganda purposes. Indeed, Greek mythology was perceived and adopted by members of the Etruscan elites as an instrument of self-representation and legitimization of their power.

Demonstrating the complexity of the issue and the heterogeneity of the individual local contexts, data from Etruscan epigraphic texts of the seventh to

sixth centuries do not appear to provide explicit indications concerning monarchical forms. One of the Late Orientalizing funerary stones discovered in Rubiera³⁷⁵ in Po valley Etruria bears the most ancient (early sixth century) attestation of the term *zilath*, which in the Etruscan inscriptions of the fourth to second centuries indicates the city's supreme magistrate. It is possible that in this case *zilath* corresponds to a local *rex*³⁷⁶ or is used in a generic sense to refer to the "headman."³⁷⁷ It might, however, identify a magistrate, considering the variety of Etruscan constitutional arrangements and the typically precocious nature of "colonial" contexts such as Rubiera. Consider also that the *cippus* found in Tragliatella³⁷⁸ documents the presence of *maru*, another Etruscan magisterial office, in Caere in the mid sixth century.

2Late-Archaic Period

In the current historical interpretation,³⁷⁹ the period from the last decades of the sixth to the first decades of the fifth century represents a long phase of transition, by the end of which the Etruscan cities (or at least most of them) had abandoned monarchical regimes in favor of some form of republican order. In some settlements this shift is believed to have entailed experimentation with forms of radical "democracy" and/or experiences of tyranny, similar to what was happening in the same period in the Greek colonies of southern Italy and Sicily (as well as Greece itself).

Overall, this interpretation is plausible. There is no doubt that the urbanization of Etruscan settlements, the structural and functional differentiation of local social systems, and the growth of "intermediate" social classes (artisans, traders, etc.) all somehow weakened and reduced (but did not entirely obliterate) the preeminent political, social and economic role of the Etruscan elites in the Orientalizing and Archaic periods. It is also a fair assumption that in the Etruscan cities of the Late Archaic period such transformations led to experimentation with new forms of government.³⁸⁰ It is harder to say, however, precisely what these forms consisted of. From an assessment of the ancient authors' reconstruction of Late Archaic Etruscan history, with reference to historic and institutional contexts about which much more is known (Greece, Rome), it may be inferred that the figures found at the head of the city-states in that period played a role that was in some ways comparable to that of a tyrant (or tyrant-king). In fragments attributed to the sophist Hippias of Elis,³⁸¹ who lived in the second half of the fifth century, the association of the Etruscans with tyranny was cited as an etymological explanation of the Greek term *tyrannos*, said to be derived from the name of the Tyrrheni.

An example of a leader with tyrannical characteristics is the evil Mezentius of Caere, who was responsible for the brutal killing (by stoning) of the

prisoners from Phocaea following the battle of Alalia around 540.³⁸² The historicity of this figure, known primarily from Virgil's Aeneid,³⁸³ is highly debatable; he may be recognized today as the projection backwards into the mythical past of an Etruscan leader of the Archaic period. Another figure from Caere who appears to have been some sort of tyrant is Thefarie Velianas, "ruler over Cisra" in the late sixth century. From the three inscriptions on gold plates discovered in the sanctuary of Pyrgi ("the Pyrgi Tablets"),³⁸⁴ we learn that Thefarie Velianas had a temple and a sanctuary built in honor of Uni (assimilated to the Phoenician Astarte), to give thanks for the help received three years earlier on the occasion of his rise to power.

Another possible tyrant is Mastarna, identified by ancient tradition with Servius Tullius.³⁸⁵ He is shown with his friends and supporters Aulus and Caelius Vibenna, generals from Vulci, in the famous cycle of frescoes in the François Tomb in Vulci.³⁸⁶ Lars Porsenna, whom literary sources refer to as the lord of Clusium and Volsinii,³⁸⁷ may also have been a tyrant. Together with his son Arruns, he is described as seeking to help Tarquinius Superbus return to Rome after his expulsion (509 BCE), though his real objective was to seize the city himself.

The fall of tyrannical monarchies in the course of the sixth century in Athens (Hippias, in 510) and Rome (Tarquinius Superbus, in 509) was explained by ancient historians as the "expulsion of the king-tyrants." This interpretative model could also be applied to Etruria, at least in certain cases. In reference to the events of 509, the ancient authors mention popular assemblies (*ekklesiai*) and magistrates (*tele*) in the city of Tarquinii.³⁸⁸ In 404 the *populi* of Etruria declined to assist Veii, at war with Rome, while the city was still *sub rege* (Livy 5.1.6).

3 From the Fifth to the Second Centuries

For the period from the fifth to the beginning of the first century (the Social War, 91–89 BCE), the study of the forms of political organization in Etruscan cities benefits from much richer and more varied documentation. To the data retrievable from the archaeological sources may be added the information yielded by the numismatic evidence. Moreover, for the purposes of historical reconstruction, the literary sources pose fewer problems of reliability, although certain weak points remain. For one thing, the chronological distance between the events being narrated and their annotation in the sources is much smaller. However, the greater historiographical credibility of the information recorded by the ancient authors must be weighed together with their limited interest in the political and institutional arrangements of Etruscan cities and the complete absence of any information of a technical or juridical nature. Their attention is essentially taken up by the dialectic between *domini* and

servi, around which Etruscan society generally appears to have been polarized. There are isolated accounts, such as the late contribution by Hesychius of Miletus,³⁸⁹ who glosses the term *drouna* as an Etruscan word (*truna?* *thruna?*) designating “the magistrature among the Tyrrheni.” However, the term does not thus far seem to have any equivalent in the rich legacy of Etruscan epigraphy.

In any case, it is the epigraphic sources—much more abundant than previously—that provide the most explicit and significant data regarding the chronology of the fourth to the second centuries. There are dozens of Etruscan inscriptions containing information of institutional interest. In addition to magisterial terminology, they also yield an institutional lexicon, of limited extent but reasonably complex, essentially relating to urban organization and the territorial limits of the city’s jurisdiction. For example, the Etruscan term *spura* denotes the “community;” *methlum* the “city” or “urban space;” *tuthina* the “village” or the “area within its territorial jurisdiction;” *cilth*, the “arx” or “acropolis;” *rasna* the “people.”³⁹⁰

Above all, the Etruscan inscriptions of the fourth to the second centuries enable us to reconstruct, with a certain degree of reliability, especially for certain cities, the magisterial system in force in the Etruscan settlements of the time. This was a fairly complex system, with elected posts of one year’s duration³⁹¹ that could be held more than once, of an individual or collegiate nature, with functions and competences that are often hard to discern. Also active in Etruscan city-states were collegiate bodies that the ancient authors describe as local assemblies or senates,³⁹² made up of exponents of the city’s nobility. Possible analogies with the situation of Rome, together with clues contained in the literary sources,³⁹³ suggest that the populations of Etruscan cities, probably from the start of the monarchical period onward, were divided up into tribes, which were probably subdivided into *curiae*.

The existence of an institutional setup of this kind within the Etruscan settlements of the period constitutes explicit evidence of the shift from monarchical regimes (or similar arrangements) to republican ones.³⁹⁴ This process seems to have had different timescales and outcomes depending on the city. In some cases, it seems to have taken place quite early, as in Tarquinii, for example, a city which—apart from the local origin of the Tarquinii dynasty—had no known traditions of royal government. The presence here of republican institutions is recorded in the literary sources as early as the late sixth century, while in Caere the presence of a *maru* in the sixth century is documented epigraphically. In other cases, the shift may have been more gradual or discontinuous. Caere, for example, in the first half of the fourth century seems to have been ruled by a *rex Caeritum*, mentioned in the *elogium* by Aulus Spurinna.³⁹⁵ In Veii, apart from a brief, late parenthesis, the monarchical regime seems to have never really been abandoned, considering that as late as 404 the inhabitants appointed a *rex*. For Felsina too, on the basis of iconographic data, particularly the explicitly regal ideology that emerges

from the figurative decoration of the funerary stelae of the fifth to fourth centuries, some scholars have posited the prolonged survival of the monarchical system.³⁹⁶

In any case, the shift from monarchical to republican forms did not substantially modify the oligarchical nature of Etruscan government. In the first few decades of the fifth century, after the disastrous Etruscan defeat in the sea of Cumae (474) and in the same period as the so-called “closing of the patriciate” in Rome, the Etruscan oligarchies seem to have closed ranks in defense of their privileges, in what has been termed an oligarchic “closure” or “involution” in Etruscan society at that time.³⁹⁷

Until the Roman conquest, magisterial office and the priesthood continued to be the preserve of local elites (*domini* or exponents of the *ordo principum*), who occupied the assemblies of the senates and the citizens and from whom the *princeps civitatis* was chosen.

The names of these magistrates and priests appear mostly in Etruscan funerary inscriptions. There are significant quantitative differences, however, in the documentation available. Only in the case of Tarquinii and the settlements associated with it (Musarna, Tuscania, Norchia) is there sufficient information; about fifty inscriptions have been discovered there, containing elements of institutional interest. Only few inscriptions are available for the other Etruscan city-states. It has therefore rightly been observed that only for Tarquinii can the available material be considered significant³⁹⁸ —sufficient for example to enable a plausible reconstruction of the local *cursus honorum*. In the other cases this is not possible due to the scarcity of known evidence. This may not be pure coincidence, considering the city’s ancient and consolidated republican tradition and the absence of data concerning the existence of local *reges*. Nor is it likely to be pure coincidence that for Veii, a city strongly tied to monarchical institutions, there are no epigraphic attestations of local magistrates. However, this silence is also a result of its early conquest by the Romans (396), who put an end to the city’s autonomous institutional history.

In examining the magisterial system of the Etruscan settlements of the fourth to the second centuries, it is important to distinguish between the abstract form (i.e. the magistrature), almost always characterized by the suffixes *-uch* and *-uc*, and the concrete form (i.e. the individual magistrate), indicated by a broader range of suffixes.³⁹⁹ In the case of Tarquinii at least, it is possible, as mentioned above, to reconstruct the plausible career path (*cursus honorum*) of a public magistrate, as in the Roman world. This began with the *marunuch* magistrature, which then led to the *eisnevc* or perhaps *ep(ur)thnevc*, the *macstrevc*, and finally the *zilach*.

In Etruria the *marunuch* (corresponding to a *maru*), which is also attested among the Umbrians, appears to have existed as both an individual and a collegiate office.⁴⁰⁰ Very often an attribute or an appellative indicates the area of competence (*m. spurana*, *m. pachathura*. *m. spuran cepen*, to name just the

most frequently attested forms). This appears to have extended to the religious and building spheres, thus making it to some extent comparable with the Roman *quaestura* and *aedilitas*.

Etymologically, the *eisnev* (corresponding to an **eisne-*) is linked to the Etruscan adjective *aisna/eisna*, meaning “sacred action.” The office is believed to have had priestly functions, as did the *cepen*, which however should probably not be considered part of the Etruscan magistratures.

The office of *ep(u)rthnev* (corresponding to an **ep(u)rthne*), plausibly coreferential with the forms *purthsvac/purthsvana*, is also hard to define. Various unsatisfactory explanations have been proposed on the basis of its etymology, linking it to the name of Porsenna or the Greek institution of *pritanía*. In any case it is believed to have been a highly important office that was not included in the *cursus honorum*.

Military prerogatives are believed to have accrued to the *macstre* (corresponding to a **macstre*), which seems to be the literary transcription, via the transposition in the place name *Macstrna/Mastarna* of the Latin *magister*,⁴⁰¹ with particular reference to the *magister populi* or *equitum*.

At the top of the Etruscan magistrature was the office of *zilach/zilac* (corresponding to a *zilath/zilat*), which was held by eminent persons in the various communities. It is also the office with the earliest attestation, dating back to the beginning of the sixth century. It was both an individual and a collegiate post, appointed on an annual basis, which could be held for as many as eleven times, according to the available evidence. It was eponymous and often accompanied by attributes (*z. parchis*, *z. seleita/selaita*, *z. eterau/eterav*, *z. munica*, *z. mechl rasnal*, *z. cechaneri*, etc.) that specify the area of competence or allude to some form of hierarchy within the category.

For some of these specifications, we can be more precise. The *zilath eterau/eterav*, for example, was associated with the youth domain in that the post was held by a young person, preparatory to the *cursus honorum* itself, or corresponded to the leader of a youth organization.⁴⁰² The *zilath mechl rasnal* is today identified with the supreme citizen magistrate at the head of the *populus (rasna)*, i.e. of the individual city-state and its territory (for example Tarquinii and its *ager*). Another was the *zilath cechaneri*, corresponding to the highest office of the so-called League of the twelve Etruscan *populi*.

Of the magistrates, especially the *zilath*, there are many iconographic attestations in the Etruscan art of the period. One of the first representations is probably that of a funerary *cippus* from Clusium (475–450): seated on a dais, two magistrates (or perhaps two *agonothetes*?), a scribe, and a lictor observe a parade of winners of the *agōn*.⁴⁰³ However, it is above all in later Etruscan figurative works that the image of the magistrate becomes common. The scenes painted on the walls of the funerary chambers of Tarquinii or sculpted on the caskets of sarcophagi and urns from the settlements of southern Etruria (Caere, Tarquinii, Vulci) and northern Etruria (Volterra) portray the magistrate in a chariot or standing in a procession escorted by lictors, *apparitores* and

musicians.⁴⁰⁴ With the semantic ambivalence typical of Etruscan funerary iconography, this scene is loaded with symbolic and allusive meanings that represent the journey of the deceased magistrate to the world of the dead, but also, as some have pointed out,⁴⁰⁵ reflect real magisterial processions and faithfully reproduce their personages and attributes.

The earliest examples of the iconographic tradition of the magisterial procession in southern Etruria date back to the late fifth century. These include the representations on the sarcophagi of Ramtha Visnai in Vulci and the Tomb of the Sarcophagi in Caere (which both show distinctive attributes of magistrates such as the *sella curulis* and the *lituus*). From the beginning of the fourth century, this is also seen in the funerary paintings of Tarquinii (Tomb of the Pygmies), where it is attested in various contexts up to the third century (the Tomb of the Shields, the Bruschi Tomb, the Tomb of the Meeting, the Tomb of Typhon) (**Colour plates 42–48**). Even in the second century, it was still in use in Volterra, on the reliefs that decorate the caskets of the locally produced cinerary urns, although it was by then subject to the growing influence of Roman iconography.

4Etruscan federal organization

While Etruscan forms of political organization depended primarily on the individual cities (city-states), Etruscan literary and epigraphic sources also mention the existence of a (con)federal-organism encompassing the twelve *populi* of Etruria (*duodecim populi*, *duodecim populi Etruriae*, *dodeka hegemoniai*, or more simply *Etruria*, *omnis Etruria*).⁴⁰⁶

The expression of an ethnic-national identity linked to the *nomen omne Etruscum*,⁴⁰⁷ the League of the “twelve peoples of Etruria,” as it is conventionally referred to in modern Etruscological discourse, is believed to have been a stable but fluid political and religious structure, able to adapt over time and incorporate settlements that had acquired importance and political autonomy in place of others that had declined or had been conquered. It is therefore possible that it originally included the cities of Veii, Caere, Tarquinii, Vulci, Volsinii, Clusium, Vetulonia, Volterra, Perugia, Cortona, Arretium, and Faesulae; and that cities such as Rusellae, Populonia, and Pisa subsequently replaced others that were conquered by the Romans or simply declined, such as Veii, Vetulonia and perhaps even Caere.

In any case, the League of the twelve *populi* appears to be cited mostly by the ancient authors in connection with the assemblies that were held near Volsinii at the *fanum Voltumnae*, i.e. the federal sanctuary dedicated to Voltumna, *deus princeps Etruriae* (Varro *Ling.* 5.8.46), which is traditionally considered to be near Orvieto.⁴⁰⁸ Livy⁴⁰⁹ records a series of meetings of the *concilia Etruriae* between 434 and 352, in which questions of a political and

military nature were debated. These assemblies, which until 397 discussed issues relating to the conflict between Rome and Veii, could authorize armed intervention by the members of the League in support of an individual city or even the establishment of a federal army.

It is plausible that *concilia* had also been held in an earlier period. For some sources, especially those of the annalistic type, the existence of the twelve *populi* of Etruria dates back to the age of the Tarquinii,⁴¹⁰ or even to that of Romulus (e.g., Livy 1.8.3). It is practically certain that they continued to be held well into the fourth and even third century, if we consider the generic references in the literary sources to assemblies held by the peoples of Etruria in connection with their clashes with Rome.⁴¹¹ In the fifth and fourth centuries, the meetings of the *concilia* at the *fanum Voltumnae* seem to have been held regularly, perhaps once a year. The decisions of the assembly were made by vote, as explicitly recorded by the ancient authors,⁴¹² albeit in reference to the monarchical era. Any dissent from the common policy could lead to the exclusion of individual cities from the League.⁴¹³

When the *concilia Etruriae* were held, *ludi* were organized and “federal” officials were elected. In the monarchical period at least, the League was headed by a king elected from among the sovereigns of the twelve *populi*, to whom they entrusted their *insignia* (one lictor from each of them) and on whom they conferred full powers.⁴¹⁴ Subsequently, with the advent of republican institutions, the federal leader was chosen from among the *principes* (Livy 2.44.8), i.e. the superior magistrates (*zilath*) of the twelve *populi*. It is possible that the holders of this post were given the title of *zilath cechaneri* (“responsible for higher matters”), attested by Etruscan epigraphy. The anonymous occupant of the Tomb of the Meeting in Tarquinii may have held such a post (Colour plate 44).⁴¹⁵

The ancient authors also record the election (in 403) of a *sacerdos Etruriae* (Livy 5.1.5) during the *solemnia ludorum quos intermittit nefas est* (5.1.4). Although we do not need to accept—as has frequently been proposed⁴¹⁶—that the League was originally and essentially of a religious character, the literary sources provide compelling evidence of the centrality of religious practice in the context of the Etruscan League,⁴¹⁷ as in the case of other (con)federal institutions in ancient times. The sources also confirm the importance of the political and representative function of the sanctuaries in Etruria (or at least some of them), again amply attested elsewhere in the ancient world.

The purely formal survival of the Etruscan League in the Roman Imperial epoch—right up until the fourth century CE—is attested by Latin inscriptions that continued to make reference to official posts (*praetor Etruriae XV populorum*, *aedilis Etruriae*) that recalled the ancient structures of the League.⁴¹⁸ These were elective posts of a year’s duration, of a religious but essentially honorific nature, reserved for members of the municipal Italic elites of senatorial and equestrian rank. They reflect the Etruscan revival that

characterized the early Imperial age and led, in the Augustan and Claudian epochs, to the re-establishment—in an antiquarian perspective—of the Etruscan League, with the number of cities increased to fifteen.

10Economy and trade

To the memory of Mark Weir

Abstract: For many centuries, the Etruscan economy was one of the most thriving in the Mediterranean, driving intense trading over an area stretching from eastern Greece (Samos, Miletus) to the far Western reaches (Carthage, Iberia). Yet in spite of their importance, there are very few direct sources concerning these processes. After a brief overview of these sources, this chapter looks at the different scales of Etruscan production and trade (city, regional, and Mediterranean networks). This is followed by a diachronic presentation of the principal historical phases of the Etruscan economy. The development of the earliest processes of stockpiling and specialized productions, above all in metalworking (eighth century BCE), led to the formation of a highly prestigious aristocracy (seventh century) that was able to control production and trade over long distances. In parallel, various forms of highly specialized manufacturing developed. The sixth century saw the emergence of a phase of emporia, with specialized trading and the affirmation of a craftsmen class in the various Etruscan cities. Coastal trade was structured in a number of ports in southern Etruria (Gravisca, Pyrgi). This phase was characterized by a marked mobility of craftsmen and merchants, as is shown above all by the dedications found in various trading sites and sanctuaries throughout the Mediterranean (Mileto, Naucratis, Carthage). Transformations during the fifth century brought about a crisis in some local economies (above all in southern Etruria), but also fostered a notable boom for centers in the Po Valley (Felsina, Spina, Adria, Marzabotto) and on the Tyrrhenian (Aleria, in Corsica). In the fourth century, coinage entered commercial exchanges, even though—paradoxically—trading circuits had reformed on a local scale. The main goods exchanged over this broad chronological span were certainly staple commodities (crude metal) and the products of specialized agriculture (wine, oil), together with the products of luxury craftsmanship, such as metalworking and probably perfumes, textiles and other precious commodities. However, such a cursory overview must not obscure the many issues still under debate. Two such topics are outlined in the closing section: whether use was made of intermediaries in the network of Etruscan maritime trade, and how such a widespread trading network was sustained in an essentially pre-monetary environment, drawing on other systems of equivalence such as metal ingots of known weight.

Keywords: trade, land, mobility, agricultural products, craft products

1Methodological aspects and sources on the Etruscan economy

There are two immediate difficulties facing anybody wishing to write a history of an ancient economy: the lack of any theoretical consideration of economic factors in ancient times, and the difficulty of quantifying phenomena. These shortcomings are even more dramatic when dealing with a

people like the Etruscans, who left no direct written testimonies of their own history. This could be why very few attempts have been made to sum up the economic history of Etruscan societies,⁴¹⁹ even though there is an enormous literature concerning particular aspects of manufacturing, production, trade and everyday life. Nonetheless, rather than forgoing the attempt to trace an economic history of ancient societies, it is appropriate to perfect our interpretative models and collate all the various sources available to us. If we cannot pin down the exact quantities involved in transactions (and after all, for how many societies prior to the modern age are such calculations possible?), we have to focus on the quality of the evidence. This methodological approach, which owes something to the disciplines of anthropology and social history, investigates the impact—even indirectly—of exchanges on the development and configuration of ancient societies, without losing sight of the partial and hence modifiable nature of the results obtained.

The sources for a history of trade and the economy in Etruria fall essentially into three categories: a) literary; b) epigraphic; and c) archaeological. The sources of the first type, which are primarily Greek and Roman, are often affected by phenomena of distortion common in the representation of foreign societies. An eloquent example of such an attitude is the way in which the Etruscans' prosperity⁴²⁰ was perceived as excessive luxury—*tryphé*—and thus as a negative quality.⁴²¹ Another example of misperception is piracy. This activity is often associated with the Etruscan presence on the seas, at least from 530 BCE onwards, when the legend of the abduction of Dionysus by Tyrrhenian pirates first featured on Ionian and Attic vases.⁴²² In the Augustan age, Strabo (5.3.5) described joint actions of piracy by the Etruscans and inhabitants of Antium in the second half of the fourth century. Undoubtedly piracy involved the violent seizure of goods, and was particularly common in certain contexts such as the slave trade. But in antiquity it was a widely practiced economic activity: not only by the Phoenicians (Homer, *Odyssey*) but also by the Greeks themselves in a remote past (Thuc. 1.5).

The epigraphic sources never make direct reference to trade, meaning that we do not know the vocabulary used for this activity in Etruscan. On some recipients that have come to light, we do, however, have traces of calculations and the so-called “trademarks,” symbols representing owners or traders.⁴²³ The discovery of texts, such as the lead plaque found at Pech Maho (France), dating from the beginning of the fifth century, provides new information. Although it has elicited a series of controversial interpretations, in this text, all scholars recognize:⁴²⁴ a) the Etruscan name of Marseille, i.e. *mataliai*; b) the first evidence of the use of depots (Etruscan *kisne*); c) evidence of a very extensive commercial enterprise, involving an Etruscan (*Vel*) and a Latin merchant (*Utave*), who signed the contract in a Greek trading post in the western Mediterranean, probably Marseille or its Iberian colony, Emporion (now Ampurias).

Archaeology still provides the fundamental evidence for establishing Etruscan economic history, whether in terms of the landscape or traditional studies on the production and distribution of goods. Yet the use of archaeological remains obviously presents some problems of interpretation. Most of the data comes from funerary contexts, which, far from being the equivalent of ledgers, were intended as a kind of social and symbolic representation. Moreover, the process of circulation (seen in amphoras) only partially coincides with production processes (such as agricultural resources). In spite of these limits, archaeology gives a fairly reliable overview of economic processes, sometimes providing firsthand information. This is the case of shipwrecks, precious sources for studying trade routes and cargoes. But in this case too, the information that can be derived is never an objective entity, but rather a matter of interpretation.

2Regional, urban and Mediterranean networks

The economy occupied a number of spaces, which conditioned production and exchange mechanisms. In order to understand the specificity of the Etruscan economic system, it must be viewed on several different scales. On one scale we have the urban realities that constantly characterize the development of Etruscan history,⁴²⁵ from the “Villanovan revolution”⁴²⁶ through the Roman conquest. The affirmation of the Tyrrhenian ports in the sixth century testifies to the connections between emporium, city and territory, seen particularly clearly in the case of Tarquinia.⁴²⁷ Civic organization also accounts for the different reactions towards global events such as the so-called “crisis of the fifth century,” and the various policies concerning coinage during the fourth century. The second scale concerns the diversity of regional districts. The distinction between maritime, mining and Po Valley Etruria is not merely a modern convention but corresponds to different economic realities. However, these regional varieties should not be seen as idiosyncratic. On the contrary, the Etruscan communities soon distinguished themselves for their capacity to interact with their surroundings. We can think of the mining of metal ores but also of the hydraulic know-how that made it possible to manage apparently hostile environments, such as saline lagoons. Veii, Pisa, and Spina are three illustrations of the Etruscans’ ability to transform their natural environment. At the same time, their political strategies made it possible to extend the boundaries of regional realities, as is seen in the Etruscan expansion in the Po starting at the end of the sixth century, probably the work of the cities in the hinterland of northern Etruria, mostly Chiusi.

The third approach is on the Mediterranean scale, and in the case of the Etruscan economy, this became significant very early on.⁴²⁸ Commercial expansion took place first of all within the western quadrilateral lying

between Tyrrhenian Etruria, Sardinia, the Euboic settlements in Campania (Pithehekussai, Cumae), and the western Phoenician sites from Carthage to the settlements in Sardinia. But already in the Geometric period, this scenario extended to the Aegean Mediterranean, as is seen by the presence of Etruscan votive offerings—weapons, fibulae, vessels and ornaments, dating from the ninth–sixth centuries—in several Greek sanctuaries.⁴²⁹ Starting from 630, the Etruscan network regularly reached Celtic Europe⁴³⁰ and Iberia.⁴³¹

3The formation phase (eighth century)

Our investigation begins in the eighth century. This is when regional varieties emerge in the Italic peninsula, when Greeks (Euboeans, Achaeans and Corinthians) founded several cities in southern Italy and Phoenicians reinforced their existing footholds in Sardinia and Sicily. The occupation of the historic Etruscan sites (Veio, Tarquinia, Populonia) and their territories involved an intensive exploitation of the territory that has suggested a full-blown internal colonization.⁴³² For the first time, the Etruscans extended their territorial limits in the direction of the fertile lands of the Po Plain and Campania. This agricultural expansion also had a technological basis. It probably relied on the alternation of crops and fallow land and the introduction of new tools such as the plow, which occupies pride of place in one of the finest specimens of Italic and indeed Mediterranean craftsmanship, the cult-chariot of Bisenzio (Fig. 10.1). Individuals who were at the head of emerging family groups fostered this expansion, and these people eventually became genuine aristocrats, recognizable by the prestige objects found in some significant funerary contexts.⁴³³ These dynamics imply the formation of a class of servants who were dependent on their overlords and on the land, a social category that in some regions (such as southern Etruria) persisted until the fourth century.⁴³⁴ Moreover, already in the eighth century, Etruscan societies were able to intervene simultaneously in various sectors of the production and circulation of goods. In this period, metallurgical activities can be linked to the cities, while in the Late Bronze Age they took place on a regional scale,⁴³⁵ suggested, among other things, by the way in which the coastal system flourished (Populonia and Vetulonia). On the one hand, centers had common interests in the exploitation of mineral deposits on Elba, and on the other in exchanges with Sardinia, another major mining region. Some particularly dynamic centers like Tarquinia could have played an important role right from the Early Iron Age in the search for minerals, in particular iron.⁴³⁶ Another element is the richness of the metal objects produced in the various ateliers, found above all in tombs or deposits (the so-called “hoards”). The largest of such deposits came to light in Bologna. It contained 14,838 bronze objects, and three made of iron, weighing 1418 kg in all, dating mostly

from between the ninth century and the first decades of the seventh century, when the deposit seems to have been sealed.⁴³⁷ Moreover, starting in the mid eighth century, one can recognize an ever-larger network of exchanges with the Aegean and the Near East. At Veii and at Pontecagnano, for example, the presence of Euboic Geometric bowls (with semicircles and *àchevrons*,) seems to accompany or even precede the colonization at Pithecusa and Cumae.⁴³⁸ This process brought about a change in indicators of power. The control of wide-ranging exchanges allowed to emerging individuals to add a new political status to their private role of *pater familias*. The role of women became one of the linchpins of the trade system through matrimonial alliances. At the beginning of the eighth century, a female tomb from Vulci containing three Sardinian bronze statuettes shows how extraneous women could be assimilated into local society.⁴³⁹ The exchange process became at the same time cause and effect of the formation of a predominant class that was to become visible, exhibiting very pronounced exterior markers, over the following century.

Fig. 10.1: The chariot of Bisenzio. Rome, Villa Giulia (after Woytowitsch 1978, pl. 24)

4Aristocratic expansion (seventh century)

In the seventh century, the aristocracy attained a political and economic rank

that was of a very high level, perceptible in this phase thanks to epigraphs and archaeological evidence. This is when the gentilitial—an onomastic formula that establishes membership of a family group in which the name, and presumably also the estate, is passed on—came into existence.⁴⁴⁰ Once again, the exploitation of resources (both agrarian and mineral) and the predominance of trading networks were the cornerstones for the enormous expansion of Orientalizing Etruscan objects. In parallel, the introduction of specialized cultures (such as grapes and olive) created new forms of wealth and exportation networks. The rural area of Caere, one of the leading cities of Orientalizing Etruscan society, numbered 113 farms and agricultural holdings dating to between the end of the seventh and the sixth century.⁴⁴¹ The discovery of grindstones, dolia, amphoras and animal remains, including game, indicate that cereals, grapes and olives were cultivated, as well as animal husbandry. Finally, the presence of aristocratic tumuli (e.g. in the Monteroni necropolises) together with the existence, already in the Archaic period, of gentilitials associated with the local toponym (*Alsaia*) suggest that an aristocratic component was directly involved in the dynamics of territorial occupation.⁴⁴² To this we can now add the increased technical prowess of Etruscan craftsmanship. Like the Greeks and Phoenicians, the Etruscans became famous for the manufacture of prestigious objects, made in a wide range of materials, including clay and bronze, certainly, but also ivory, amber, gold and ostrich egg. It is no coincidence that around the mid seventh century, the sources place in this phase the arrival in Tarquinia of the Corinthian noble Demaratus, with craftsmen in his entourage.⁴⁴³

In practice, these phases of trade in Etruria seem to have been centered on gift exchange an economic as well as a ritualized process.⁴⁴⁴ This model of trade, which was common among their Greek trading partners, is based on mechanisms of reciprocity⁴⁴⁵ and presupposes a parity—generally at a socially elevated level—of the partners. In this type of commerce—*prexis* in Greek—the production of resources (e.g. from the land) and the sale of surplus are substantially identical.⁴⁴⁶ The donors' dedications frequently inscribed on the precious objects and ceramic ware conform to this model.⁴⁴⁷ A vase found in a tomb in Tarquinia dating from around 630 bore mention of a “*rutile hipucrates*”⁴⁴⁸ whose onomastic formula undoubtedly denotes the Greek aristocratic name *Hippocrates* preceded by the Latin name *Rutilius*, probably given to him in the individual's Etruscan place of residence (Fig. 47.2a).⁴⁴⁹ The “aristocratic” model of production and trade likely persisted at least until 590–580, when a vessel—believed to have been sailing between Etruria and Eastern Greece (Ionia), with ports of call at Corinth and possibly Pithecusa—sank off the Isola del Giglio.⁴⁵⁰ The objects found on board indicate that the *naukleros* (the captain, and possibly also owner of the craft) and crew, probably natives of an Ionian city, enjoyed writing and quite possibly also music.

5The emporic phase (sixth century)

By the time between seventh and sixth centuries the transformation was under way. The rise and fall in the fortunes of Etruscan bucchero ware is a good example of the dynamics of development in Etruscan societies starting in the last decades of the seventh century.⁴⁵¹ In the first phase (680–630) such ware began to be exported from Caere towards southern and maritime Etruria, with very few craftsmen involved. From 630, ateliers proliferated particularly in southern Etruria (Caere, Vulci, Tarquinia) and their products were exported over a large area, stretching from Marseille to Carthage to the Nile delta. This boom attained spectacular proportions in the Late Orientalizing period (610–580).

During the sixth century, manufacturing was the protagonist of many significant changes in Etruscan cities, where it had acquired autonomy, no longer at the service of the *princeps* but rather catering for public requirements (such as the construction of temples). The production of surplus and the circulation of goods involved ever-broader segments of the population that gained visibility in the topographical and architectonic organization of towns and necropolises (Orvieto).⁴⁵² At Caere, the craftsmen's quarter in the area of the Vigna Parrocchiale was found to contain pigments and various waste materials, proving that glass, iron and copper were all worked here.⁴⁵³ At Populonia, structures for iron working were in use from the second half of the sixth through to the first half of the fifth century.⁴⁵⁴

In parallel, Etruscan trade took on features that can be described as specialized or “emporic,” reflecting an evolution that also affected Greek cities, which were constant trading partners of the Etruscan world in the sixth century.⁴⁵⁵ To give the briefest outline of what is the subject of immense debate, the emporium is a place for trade separate from the urban community but subject to its juridical and political control, a fixed and often obligatory port of call in a trading process and finally somewhere that undergoes an influx of foreigners. Our knowledge of the emporic phenomenon in the archaic and classical Mediterranean owes much to archaeological research carried out along the Tyrrhenian coast over the last fifty years, in particular at Gravisca, the port for Tarquinia, founded at the beginning of the sixth century, and at Pyrgi, the port for Caere, founded around the end of the seventh–early sixth century.⁴⁵⁶ The two ports have certain features in common. Both were the point of convergence for cosmopolitan trading carried out over great distances. The Ionian component predominates at Gravisca in the first quarter of the sixth century, while in the second and third, there is a higher incidence of East-Greek and Laconian ceramic ware. From the fourth quarter of the sixth century, the Aeginian component began to predominate at Gravisca, as can be deduced from epigraphs, in particular the unique dedication by Sostratos to Apollo Aeginas, dating from about 510 (Fig. 35.12). This may be the merchant Sostratos cited by Herodotus (4.152), and also the same person

who left his signature in the emporium of Naucratis. If so, in view of the quantity of trademarks found at Gravisca, he was the Greek merchant responsible for bringing “from Athens to Etruria (...) more pots than any other individual.”⁴⁵⁷ Other graffiti illustrate the variety of ethnic components in this emporium: Ionians and Aeginians, of course, but also Corinthians and Achaeans.⁴⁵⁸ At Pyrgi, the foreign component is Phoenician, probably from Carthage itself, as indicated by the exceptional record of the inscriptions on the golden plaques found in Temple B, dating from the beginning of the fifth century (Fig. 35.2). The text, inscribed in Etruscan and Punic, states that *Thefarie Velianas*, the king of Caere, consecrated a temple to the female divinity Uni-Astarte, who was worshipped by both the local and the Phoenician (probably Carthaginian) communities. These texts show three important things. The first is the ability to set up strategies and alliances. Aristotle (*Pol.* 3.5.10–11, 1280a) knew of the existence of conventions (*graphai*) between Etruscans and Carthaginians concerning the goods that could be imported and forms of mutual alliance. The second is the active intervention of a political figure—Thefarie Velianas—to create the conditions that would encourage the arrival of foreign merchants and the development of trade. The third is that in these Tyrrhenian ports, as at the major Greek emporium of Naucratis in Egypt, the divinity played a vital role in the reception of foreigners and in underwriting commercial dealings. In the case of Etruria, the divinity took over the functions that in the Orientalizing society had been performed by the princes.⁴⁵⁹

In this phase the trading network became very widespread. In Italy, exportations from Etruria itself and from Etruscan Northern Campania (Capua) were directed above all towards the aristocracies of the Peucetians and Daunians, taking advantage of internal river-borne routes (along the Calore-Sele).⁴⁶⁰ Etruscan sea-borne destinations involved not only the traditional Tyrrhenian area, stretching from the Gulf of Lion to Carthage (as shown by the wine amphoras from Vulci and Caere), but also Central Europe and the eastern Mediterranean (Fig. 10.2). Further afield Etruscan trade went as far as North-Eastern Iberia⁴⁶¹ and regularly to the South of France, from where Etruscan objects found their way to Celtic aristocracies in the hinterland.

The forms of contact and mobility arising out of exchanges began to multiply. The most ancient inscription left by an Etruscan craftsman (from Vulci?) was found at Saint-Blaise, in the South of France, and dates from the middle of the sixth century.⁴⁶² In the settlement of Lattes, a dramatic increase in the presence of Etruscan amphoras and scripts occurred during the last quarter of the sixth century.⁴⁶³ Between the third quarter of the seventh and the mid sixth century, direct contacts may explain the presence of bucchero ware (Fig. 88.3) and Etruscan-Corinthian vases (twenty specimens in all) found at Carthage, the latter probably made at Vulci and Tarquinia.⁴⁶⁴ Personal relationships—possibly deriving from more ancient forms of contact

and exchange—appear at least in part to be codified in the so-called *tesserae hospitales*. These objects, evidence of twinning arrangements to be exhibited on arrival in a foreign port, have been found at various places throughout the Tyrrhenian area, from the emporic sanctuary of Sant’Omobono at Rome (an ivory miniature lion mentioning an Etruscan), to the necropolis of Santa Monica at Carthage (a tessera inscribed in Etruscan mentioning “a Punic of Carthage”) (Fig. 88.4).⁴⁶⁵ In some cases, we have evidence of the involvement of Etruscans in Greek commercial dealings, as for example two generations of merchants from Vulci who were active between 560 and 500, appear to have participated in the commerce of Attic pottery, using the “trademark” *fa(ltu)* found painted or more often scratched on vases.⁴⁶⁶ Greeks are known to have been assiduous visitors to Etruscan sites. The presence of Etruscan bucchero ware at Samos and Miletus in the second half of the sixth century may be due to personal dedications by Etruscans⁴⁶⁷ or more likely Greeks,⁴⁶⁸ as the rare inscriptions found on bucchero are always written in the Greek alphabet. Southern Etruria, above all, continued to attract Aegean craftsmen, often coming from Ionia. The famous hydriae from Caere, a small group of vases manufactured between 530 and 500 by Ionian craftsmen who were in residence at Caere,⁴⁶⁹ are an example of these processes. A Greek with the Etruscanized name *Larth Telicles*, cited in the inscription on an Orientalizing aryballos in bucchero, may have been involved in the local perfume industry.⁴⁷⁰

Fig. 10.2: Main types of Etruscan trade amphoras (after Py 1985, fig. 2)

6 Transformations and epilogue (fifth–fourth centuries)

In the Italic peninsula, the fifth century was a period of major social and political changes, also in macro-historical terms. One can think of the fall of Sibari in 510 and the downfall of the last Etruscan dynast in Rome in 509. Etruscan society responded in different ways to this situation, reflecting regional and urban diversities. Social conflicts took up much of the fifth century, although there was no single chronology or modality.⁴⁷¹ As a rule, we can say that the economic system in the southern cities took more of a battering. To go back to the case of the rural area of Caere, there was a “marked contraction of the rural settlement” (from 113 to 55 sites) in the fifth and fourth centuries, and an analogous contraction can be seen in the *ager cosanus*, near Vulci.⁴⁷² These transformations had a strong impact on trade. After the phase of monumentalization in 470, the sanctuary and emporium of Gravisca appears to regress to an essentially local dimension. On the other hand, the crisis did not affect Po Valley Etruria in the least. In the fifth century, it actually experienced an enormous economic and cultural development,⁴⁷³ with a large throughput of people and goods. At the end of the sixth century, *Felsina* (Bologna) looked like a new city, almost as if it had been “refounded,”⁴⁷⁴ the importation of the highest quality Attic vases soared in the years 475–450.⁴⁷⁵ In the western sector, the thriving emporium of Alalia in Corsica seems to display analogous features, with the site being intensely frequented and yielding a great variety of products.⁴⁷⁶ The Po Plain sector (Adria, Spina, Marzabotto) became an authentic powerhouse of both local resources (wheat, salt and hides) and craft (in bronze and amber) products, capable of fueling exchanges with various regions of the Greek world—especially Attica, as is evident from the wealth of imports of figured and black varnish pottery, but also Corinth, Samos and Chios (amphoras for wine and oil) and southern Italy (“Greek-Italic amphoras”).⁴⁷⁷ Both Spina and Alalia give the impression of being prosperous settlements characterized by a mixed culture, Etruscan but also Greek and indigenous, Celtic and Italic in Corsica, Umbro-Venetian in the Po Plain. In both cases, onomastics reveal a weakness or lack of the gentilitial nomen, typical of the aristocracy, and the presence of a very dynamic middle class that appears to have controlled trading in complete autonomy. This could explain why Spina was defined as a “polis” by Strabo (5.1.7). The first onomastic attestations of Alalia are *Kaile* and *Klavtie*, dating from the mid fifth century; either one could denote an origin from Caere.⁴⁷⁸ The grave goods of the population of Spina display great wealth, which justifies the tradition that exists in some ancient texts concerning a dedication by a native of Spina in the sanctuary at Delphi.⁴⁷⁹

Certainly relations were maintained with the political class of the hinterland. The stele of *Vel Kaikna*, a member of one of the most important families of Felsina, features a warship and alludes to the office of a magistrate who may have been engaged in the protection of the ports at Spina (Fig. 61.1). But such relations probably indicate forms of territorial integration between Felsina, Spina and other centers in Po Plain Etruria, rather than the relationship of dependence.⁴⁸⁰

Diversity continued to characterize the Etruscan world in the fourth century, when Rome began its systematic conquest of Etruscan territories. Manufacturing tended to have a local circulation, with only a few centers of ceramic production (Volterra, Tarquinia) managing to go beyond the local sphere. The Etruscan cities began to mint coins (in gold, silver and bronze) in the last quarter of the fifth and the first decade of the fourth century. However, this innovation was restricted to the individual cities. Only the currency issued in Populonia succeeded in establishing itself on a wider circuit during the fourth century.⁴⁸¹ At the same time, some large tombs appear to indicate that land ownership was in the hands of a few elite groups. These fertile lands were taken over by the Roman *plebs* when Veii was conquered in 396, and owned by rich Roman citizens when Tiberius Gracchus visited an almost entirely deserted southern Etruria in 133.

7Exchange commodities

One of the typical features of Etruscan trade was the ability to dominate and control a very extensive network of exchange commodities, ranging from staple goods (*biotos* in Greek) to the most varied and exotic luxury items. This ability invariably went hand in hand with a technological expertise that excelled at luxury products.

Commerce in metals illustrates the complexity of Etruscan production and exchange networks. Etruscans are known to have exported crude or semi-crude metal in the form of ingots, as exemplified by the copper bars found in the shipwreck of the Isola del Giglio, dating from 590–580. They also exported manufactured products, above all tableware (*Schnabelkannen*, basins with beaded rims, *infundibula*), to the Italic peninsula (Campania, Daunia⁴⁸²) and Celtic settlements in the South of France and Central Europe. As personal dedications, Etruscan metal implements associated with the symposium traveled as far afield as the major Greek sanctuaries (Olympia, Samos, Miletus).⁴⁸³ But this was not a one-way migration. In spite of the richness of the Etruscan mineral deposits, it must have been necessary to import metal to maintain such a major production. The wrecked ship of Rochelongue, which sank off Gaul in the mid sixth century, contained more than 1,700 bronze objects and copper bars, dating at the latest from the mid sixth century. This

cargo was probably intended as payment for supplies of wine from Vulci and Cerveteri.⁴⁸⁴ Although to date, little work has been done on it, the dissemination of tin was also important, since it was essential for the production of bronze and could be procured only in a few regions of Europe (Cornwall, Brittany, northwestern Spain, northeastern Germany, and Croatia). In this connection the presence of a tin cheese grater in a tomb at Spina is a very significant indication.⁴⁸⁵

Wine was a true dynamo of trade in the Mediterranean, and one of the chief commodities to be exported from archaic Etruria. In brief, we can observe that a recognizable circuit for the distribution of Etruscan wine was in place from the beginning of the sixth century, serving essentially the South of France, the Iberian sector and also stretching further north towards the Celtic world. Some vessels give a good idea of the scope of this trade. The so-called Grand Ribaud F had a cargo of 800–1,000 amphoras probably originating in the region of Caere. It was traditionally thought that Etruscan trade in Gaul declined with the foundation of Marseille, and did not persist beyond the middle of the sixth century. However, recent finds have shown that it continued until the end of the fifth if not into the fourth century, even though the general conditions did change when Marseille became a center to be reckoned with from 450.⁴⁸⁶

Together with the exportation of wine went the dissemination of Etruscan table customs. These enjoyed considerable prestige even in the Aegean, where Etruscan wine did not arrive very commonly, if at all. To date, only one Etruscan amphora has been found at Miletus (Fig. 14.1), while a number of fragments of bowls in bucchero dating from the sixth century have been found in sanctuaries (e.g. that of Aphrodite) as dedicatory offerings, possibly by Greek merchants who had had contact with Etruscan communities.⁴⁸⁷ The form of these bowls is very informative—they are *kantharoi*, sometimes very large (“giant-kantharoi”). First appearing in Etruria in the third quarter of the seventh century, the bucchero *kantharos* of this shape is the emblem of the vases used by Etruscans to serve wine, and is systematically found accompanying exportations of Etruscan amphoras towards Southern France until the middle of the sixth century.⁴⁸⁸ Furthermore, this vase is not the only indication of the extent of the Etruscan commercial network and of the appeal of a model that was cultural as well as economic. In the second half of the sixth century, bronze funnels (lat. *infundibula*) probably manufactured at Volsinii and Vulci were the most common Etruscan bronze implement throughout the Mediterranean, from Carthage to Cyrene and on to the Aegean world, where they were imported by Greek merchants.⁴⁸⁹

Wine and oil are not enough to explain the complexity of trading around the Mediterranean and on the mainland; the reality was undoubtedly more composite.⁴⁹⁰ According to Diodorus of Sicily (5.13.3–5; 14.1), at the time of their Tyrrhenian thalassocracy, the Etruscans went to Corsica to stock up on resin, wax and honey. Corsica was famous for its animal husbandry, and also

for slaves. The Etruscan cargo shipwrecked off the Isola del Giglio contained pine nuts, which are a spicy food with high nutritional value. Other quality goods had more specialized circuits. Perfumes began to be used in Etruria from the beginning of the Orientalizing period, as shown by the first importations of Cypriot, Eastern Greek and Rhodian vases identified in southern Etruria (Caere and Vulci). This phenomenon really took off between 630–580.⁴⁹¹ It is likely that perfumes were also produced locally, since there was a flourishing industry of oil vases—the so-called Etruscan-Corinthian *aryballoi*—manufactured at Caere and widely exported in the first half of sixth century. Such vases are found throughout southern Etruria as far as Cumae and Carthage and down the Italic peninsula (Sabins, Faliscans, Picenians).⁴⁹² They do not seem to have been exported to Gaul, which points to a substantial autonomy in the orientation of trade.⁴⁹³

The trading of textiles is likely to have taken several routes, both regional and further afield. Some imports of linen probably came to Etruria from other Italian regions such as the Po Valley and Campania.⁴⁹⁴ Although it is an isolated case, the surprising discovery of fragments of cashmere in the Etruscan settlement of Lattes could be interesting evidence of trade with central Asia.⁴⁹⁵ On the other hand, some Etruscan fibulae in bronze and amber common in Central Italy (Verucchio) reached the sanctuary of Artemis in Ephesus during the seventh century.⁴⁹⁶ As Verucchio was a flourishing center of textile production, some of these personal ornaments could have traveled with textiles.

8Open issues

The summary nature of all this information should not mask the complexity of the questions we have been considering. For example, not only was there a gradual passage from the type of aristocratic commerce to the specialized emporium, but the two patterns could at times overlap. Moreover, many topics can give rise to new interpretations and be modified by archaeological and epigraphic discoveries. What were the interactions between Etruscan and Phoenician trading?⁴⁹⁷ Was the first influx of commercial activity towards southern France Greek or Etruscan? When can we date the last forms of Etruscan presence in these regions? These have all been the objects of recent studies and debates that will certainly help us achieve a better understanding of the Ancient Mediterranean. There are two open issues in particular. The first is whether the Etruscans were directly involved in the sea-borne conveyance of their products or if they called on intermediaries (Phoenician, Ionians, Aeginians, etc.). Recently, Patrice Pomey has called attention to the archaeological “invisibility” of Etruscan vessels, which suggests that they might have used intermediaries.⁴⁹⁸ However, this is to argue *ex silentio*, and

new discoveries may well disprove this suggestion. In the same conference proceedings, Giovanni Colonna made a good case for the direct involvement of Etruscans in maritime traffic by illustrating the great mobility of Tyrrhenian merchants.⁴⁹⁹ It appears unlikely that this far-flung circulation of men and goods could have taken place entirely on foreign-owned vessels, but for the moment, it remains unresolved.⁵⁰⁰ This investigation touches on one of the classic topics in the history of commerce in the ancient world—namely, the role of intermediaries and the practice of leasing means of transport. After all, this practice was at the heart of the Athenian practice of maritime loans, well documented in the speeches of Greek orators from the second half of the fifth century.⁵⁰¹

One surprising feature of Etruscan trade is the fact that it was able to develop for centuries without minting coinage, even though it involved a circuit of exchanges extending over most of the Mediterranean. Etruscan coinage only appeared quite late, and had a local circulation, whereas counterparts had long been in circulation in Greece, southern Italy, Carthage and Rome. We also only know of rare episodes of the hoarding of foreign coins (with just a few exceptions, for example at Volterra⁵⁰² and Pyrgi⁵⁰³). This suggests that most Etruscan trading did not involve monetary exchange but was based on other forms of payment. It is likely that a fundamental role in the assessment of value was played by the weight of metals. The letters inscribed on the metals in the deposit of San Francesco in Bologna, from the seventh century, are probably an indication of calculations of this sort.⁵⁰⁴ A century later, the bars of metal known as “with dry branch” probably served a function in “trading requisites,” even though it is difficult to place them in a system of weights and measures. Guaranteed by the hallmark, these ingots had a vast circulation (from Sicily and Campania to the Po Plain and the eastern Adriatic), which testifies to their reliability.⁵⁰⁵ But there may also have been other systems of value equivalence, based for example on the capacity of some forms of ceramic ware. The role of “vase-étalon” has been attributed to the bucchero *kantharos*.⁵⁰⁶ There remains the possibility that this function may have been performed by Attic vases (e.g. *lekythoi*), found in some cases to feature numerical marks, for example at Spina. The letters and numbers imprinted on the archaic Greek amphoras found in Po Plain emporia have been associated with the city of provenance—e.g. “S(icyon?),” on a Corinthian amphora, “A” from Marzabotto—or interpreted as an indication of capacity, above all for the Chiote amphoras, whose contents was subject to variations.⁵⁰⁷

More generally, we have to consider why the Etruscan cities should have been unwilling to mint coinage. Some scholars have pointed out that money appeared as an internal solution to the crisis of the Etruscan economical system. In fact, the marked differences in ponderal systems shows the lack of political unity, and undoubtedly detracted from its economic effectiveness.⁵⁰⁸ But we can also wonder whether such a belated appearance may not have

been the outcome of a political design aimed at containing the forms of social mobility that the introduction of coinage entails. We should not forget that in Plato's ideal city, coinage was to serve only for day-to-day, local purposes,⁵⁰⁹ and that according to Xenophon,⁵¹⁰ the circulation of coinage was practically impossible in oligarchic Sparta. It is significant that the great majority of pre-monetary ingots (50%, no less) came from the Po Plain, precisely the area in which, from the sixth century onwards, the social transformations brought about by manufacturing and mercantile activities were most evident.⁵¹¹

These considerations suggest that the economic history of the Etruscans is itself currently a highly dynamic sector. Yet one fact has been securely established. To adopt the elegant expression of Jean-Paul Morel the Etruscans have taken their place in the company of mariners, merchants, and perhaps also colonial settlers and immigrant residents of the northwestern Mediterranean,⁵¹² and indeed, of the Mediterranean *tout court*.

11War and Weaponry

Abstract: The development of armaments and warfare in Etruria can best be followed through the tombs of warriors. In the ninth–eighth centuries BCE, there arose independent armaments that were strongly influenced by central European traditions, which can best be shown through helmet shapes and the *antenna* sword. Beginning in the seventh century, influence of the Greek art of war—including the phalanx tactic—increased in Etruria. The Etruscans adopted the hoplites’ shield and the flexible greaves, and probably also linen armor. Here and there Greek helmet shapes were taken over as well, but the Etruscan armorers from the seventh to the third centuries always developed their own helmet types, clearly distinct from the Greek forms. In the fourth century, the successful occupation of northern Italy made the influence of Celtic weaponry noticeable to some extent. Etruscans adopted the iron sword and helmet of the victorious Celts. The Etruscan artisans adapted the iron helmet to their own preferred material, bronze. With the subjection of the Etruscan cities to the Romans in the third and second centuries, the independent Etruscan tradition of war disappeared and with it the weapon-tombs as well.

Keywords: Helmet, Spear, Greave, Sword

1“War makes the man” in the ancient world

War played an entirely different role in ancient Italy than it does today on account of the numerous martial conflicts, since the army was of fundamental importance for the survival of a society. In contrast to today, the business of war was highly regarded, and bravery in battle counted as the highest manly virtue. It constituted one of the few possibilities for transcending the mostly very narrow social boundaries of the distinct social classes. Military success, just like wealth, ambition, shrewdness, and rhetorical ability, was an essential prerequisite for a leading position in politics. War was deadly serious and was the cruelest and most fearsome challenge that men faced. Because in the ancient world plunder was not as today forbidden, but an integral part or sometimes even the purpose of military undertakings, war also brought the possibility of achieving economic success. Thus in ancient times war exuded a certain fascination, so that the Greek philosopher Heraclitus even called war

the “father of all things.” Ancient Greece was also acquainted with the bitter side of war and not for nothing is it always accompanied in the Iliad by the adjective “man-killing.”

It is not so simple to draw up a history of war, and hence also of warriors, using the tools of archaeology. Finds that directly illuminate the events of war are extremely rare. Normally, the corpses of the losers were burned or turned over to the wild animals and thus lost forever. Traces of their ultimate sacrifice are therefore scarce. A further possibility for interpreting pre- and proto-historic war is contemporary representations of battle and warriors. But these must not be understood as direct reflections of reality, since early pictures mostly deal with a mythological or idealized image, representing the combat of various ancestors, heroes, or even gods. The study of “instruments of war”—weapons—also permits drawing conclusions about the nature of ancient war. Besides isolated finds, weapons appear in dedicatory finds. These dedications of weapons in ancient times, called Gk. *tropaia* (trophies), are closely related to military events. With good reason, they are interpreted as the dedication of weapons seized in battle to the honor of the divinities that supported the victors.

What we encounter much more often is the warriors themselves in their graves. Since warriors enjoyed high status, it was usual to bury their weapons alongside them, so that in the afterlife their warrior status could be recognized. It can be assumed that by and large in archaic societies, one took on the same role in the afterlife as in the here and now. Weapons of course are used to kill people, but the brutal moments of their use are in fact swift and short. Because of the high esteem of war in many archaic societies, weapons were often provided with military insignia and symbols of power, often richly ornamented, for the purpose of self-representation during the owners’ lifetime as well as in funerary use. To what extent these claims of warrior status in the grave necessarily corresponded to reality—or reflected a somewhat idealized and distorted image—will not be considered here.

The consistent production of iron began in Italy in the ninth or eighth century BCE. This new material had serious consequences for the conduct of war. Not only is iron harder than bronze, but iron ore is much more common in nature than copper or even tin. Much more extensive segments of the population could therefore be equipped with metal weapons, and men of warrior rank could have made an ever greater claim to power within any individual society. The replacement of bronze in the context of offensive weapons was not sudden, but gradual. Beginning in the late eighth century, iron offensive weapons—such as swords and lance—dominated the battlefield. But bronze remained the prevailing material for defensive equipment such as helmets.

2The Villanovan period (1000–730 BCE)

Curiously, the development of weapons in Iron Age central Italy begins not with ordinary weapons, but with miniaturized specimens or clay models. The earliest indications of weapons as grave goods are found in some graves from Lavinium and Santa Palomba in Latium.⁵¹³ A set of miniature weapons was found in the tenth-century Grave 21 from Lavinium, consisting of a lance, a dagger, a knife, a pair of greaves, and two figure-eight shields. We may suppose that the deceased was a warrior and entered into the afterlife as such, but his family was not quite ready to surrender actual weapons for his benefit.

The clay helmets from the Villanovan period are quite similar.⁵¹⁴ These too substituted for the valuable metal helmets. They were used as lids for the urns and presumably also characterized the deceased as outstanding warriors. The clay helmets often represent very early helmet designs and lead us to suspect that at first only clay helmets were placed on the urns and not until later, beginning about 800, were metal helmets used (Fig. 11.1).

From the late ninth through the eighth century, grave goods increase from generation to generation and a real race sets in for more and more elaborately furnished graves, which eventually peaked in the princely graves of the Orientalizing period.⁵¹⁵ This development reflects the rise of an elite from simple circumstances to the rich princely graves. At the latest, from the time of the erection of the first princely tombs, the Etruscans were successfully participating in maritime trade.⁵¹⁶

During the late ninth century, metal weapons appear in the tombs of the Villanovan culture. These are short bronze flange-hilted swords (Ger. *Griffzungenschwerver*) with T-shaped pommel, and lance points.⁵¹⁷ In the eighth century, the Italic *antenna* sword of the Tarquinian type develops, which emerged from central European models.⁵¹⁸ In the late Villanovan period, daggers as well as lance heads were more and more often made of iron. Lances took center stage to a somewhat greater extent in the late Villanovan period. The points became longer and often had a faceted socket, and the shafts were provided at the other end with an often likewise faceted ferrule. In addition, the shaft was occasionally wound with coils of bronze wire. The peak was reached by a lance from the rich warrior's Tomb 871 of the Grotta Gramiccia necropolis at Veii, whose shaft is alternately surrounded with spirals and studded with bronze nails.⁵¹⁹ Even the pouch for the slingshots were made of wire and nailed to the shaft. These especially distinctive lances remained in use during the Orientalizing period.

In the eighth century, bronze defensive equipment also appears in burials, above all in the form of bronze helmets,⁵²⁰ which (as the clay helmets had been) were placed as a lid on the urns. Most common are the striking crested helmets with towering bronze crests; helmets with knobs and helmets with simple dome-shaped caps appear also in Etruria. All these types of helmets come from Central European models from the Late Bronze Age. Crested helmets were preferred in western Central Europe, knob helmets in the Carpathian basin, and cap helmets were worn in between in southern

Germany. The Italic representatives are also distinguished from their Central European predecessors by a few technical details and their very much richer decorative bosses.

Around the middle of the eighth century, the decorated Villanovan shield developed.⁵²¹ This is a round shield of sheet bronze with a low boss in the middle. The grip is on the back behind the boss and in addition four arches or loops were riveted to the shield to take rattling pendants.⁵²² The shield was more than a defensive item and insigne; it could also make noise, possibly in connection with ritually motivated war dances. Into the Roman period, connected pairs of these Villanovan shields, being the sacred Shields of Mars, led the processions and dances of the Salii, a Roman priestly collegium.⁵²³ The decoration of the still quite small shields in the Villanovan period was limited to circles of bosses, circular bulges, groups of lines, and images of horses. The bronze Villanovan shields made of thin sheets of bronze were not very effective defensive equipment and appear to have served more as indications of status. That much more effective shields made of organic material must have existed is shown by some depictions of a large oval shield, known as the *scutum*, which counted as the preferred defensive paraphernalia of Italy until Roman times.⁵²⁴

Fig. 11.1: Chronological development of Etruscan helmets (drawing M. Ober, RGZM).

In the late Villanovan period, body armor consisted of rectangular plates of armor worn on the chest. The bronze plates that are more or less firmly attached along the long sides were fastened to the upper body with leather straps. This form of body armor still persists in the following Orientalizing period.

Figural representations, such as horse tripods,⁵²⁵ demonstrate that Villanovan warriors fought not only on foot, but also mounted on steeds.

Villanovan defensive items are found not only in Etrurian tombs, but also in Greek sanctuaries, such as Olympia and Delphi.⁵²⁶ They are very likely traces of military encounters between Etruscans and Greek colonists, who had settled in southern Italy in the eighth century. Captured weapons were dedicated to the gods by the victorious Hellenes in Greek sanctuaries.

3The Orientalizing period (730–580 BCE)

The Orientalizing period brings serious alterations in weaponry, while at the same time several traditions were preserved. The Villanovan shields are included among the traditional elements in the new period.⁵²⁷ Shields became ever bigger and often lost their grips; they had become a symbol that could no longer be used in battle. The “Tomb of the Shields and Chairs” in Caere illustrates that these shields were hung over a throne in ceremonial spaces and served only “heraldic” purposes any more⁵²⁸. At the same time the *scutum* continued to be an important component of weaponry.

Figural representations, such as the stela of Aule Feluske in Vetulonia,⁵²⁹ show that during the seventh century, Etruscan warriors had adopted the Greek hoplite shield, a round shield constructed from wood, leather, and sheet bronze. This shield with two shield handles made possible the phalanx tactic developed by the Greeks, in which dense rows of heavily armed foot soldiers face each other.⁵³⁰ The Chigi vase (an *olpe*), made in Greece and discovered in Veii in southern Etruria, represents one of the oldest illustrations of this new and very effective battlefield technique.⁵³¹ Every soldier in the offensive line uses the shield to cover not only himself, but also his neighbor to the left, which led to a highly consistent approach to battle, since if a soldier deserted from the line, he exposed his comrades, a capital offense. There arose an uncompromising battle tactic, which demanded ironclad obedience and unconditional comradeship. To this battlefield tactic the Greeks owed many victories over barbarian enemies, and it stands to reason that the Etruscans as well adopted this tactic during the seventh century. The Corinthian helmet was also adopted in the seventh century by Etruscan warriors, but only a few of these helmets, which are so characteristic of the Greek hoplites, have been found in seventh-century Etruria. Yet another element of the Greek hoplite armament, the flexible greave, also appears in Etruria for the first time in the seventh century.⁵³²

Quite sporadically, the beginning of the Orientalizing period still yields the last of the crested helmets, as in the “Tomb of the Throne” from Verucchio in the Romagna.⁵³³ These helmets have an oversized crest and like the late Villanovan shields are no longer intended for military use. Not for nothing

was a second helmet, a legitimate defensive item, included in that “Tomb of the Throne.” It was a conical helmet with a crest in the form of a horse’s mane, a type of helmet widely known in the area of Caput Adriae. Orientalizing period Etruscans developed a new type of helmet in the seventh century surrounded by a distinctive brim. Among the earliest representatives are the buckle helmets,⁵³⁴ which have a semicircular dome with two buckles that cover the rivets that secured the organic-material lining of the helmet and a turned-down brim. The helmets were topped with a horse’s mane crest, just like the Greek helmets. Alongside the buckle helmets there also still appear in Etruria helmets with composite cap,⁵³⁵ distinguished from the buckle helmets by construction from several plates, but still included among the brimmed helmets. The early brimmed helmets, however, do not play as significant a role among grave goods as the crested helmets, and they primarily appear in northern Etruria.

Beginning in the Orientalizing period, offensive weapons were largely made of iron. In close combat, Etruscan soldiers use iron daggers and large knives, whose hafts are dressed up with sheet silver or made of ivory and amber, like those from Tomb A from Casale Marittimo in Tuscany.⁵³⁶ Longswords also occasionally appear in central Italy⁵³⁷ that are related to the Greek sword, the *xiphos*. Socketed iron axes also take on special significance as weapons. From time to time the shafts of these weapons are richly decorated, such as the examples from Tomb A from Casale Marittimo in Tuscany,⁵³⁸ which indicates that they were not merely weapons, but also major status symbols. In the “Tomb of the Lictor” in Vetulonia there was even found an iron double-headed axe with a bundle of rods,⁵³⁹ the sign of dignity, that in Rome was borne before the important dignitaries. The canes were intended for clearing the path, and the axe symbolized the right to impose the death penalty.

Orientalizing-period warriors’ tombs often include a two-wheeled wagon among the grave goods.⁵⁴⁰ The *currus* is suspected of being used as a war chariot, without it being possible to prove it. The many artistic metal fittings are not particularly appropriate to a war chariot; rather they must have pertained to the privilege of driving a vehicle and with it the prestige that continued into Roman times in the form of the triumphal procession. For a short time, the successful commander was granted the originally royal right of the prestigious chariot. Figural representations in the Orientalizing period depict scenes of battle wagons,⁵⁴¹ although whether they represent contemporary battle tactics or depict mythic heroes remains uncertain.

4The Archaic period (580–450 BCE)

In the Archaic period, except for the helmets, Greek armaments and along

with them the tactic of the phalanx of hoplites ultimately prevailed in Etruria. Tendencies in that direction could already be observed in the Orientalizing period. Although it is not the case that in Italy no imported Greek weapons were in use, Etruscan artisans developed their own Etruscan variations on Hellenic weaponry.

According to the testimony of pictorial representations, the Greek hoplite shield became the Etruscan standard.⁵⁴² There are also a few physical examples of wooden shields covered with thin sheets of bronze from Etruria, as from the warriors' tombs from Vulci and Bomarzo.⁵⁴³ Alongside the Greek hoplite shield, the *scutum* remained in use in Etruria; this is verified by the bronze mounting of a spindle-shaped central rib of a *scutum* from Gualdo Tadino in Umbria⁵⁴⁴ as well as by a variety of depictions elsewhere.

Flexible bronze greaves, other components of the phalanx tactic, are also part of the normal equipment of warriors beginning in the Archaic period, and an impressive number have been preserved in Etruscan tombs.⁵⁴⁵ The simple representation of the musculature of the calf and the trim added to the edge to which the organic-material lining was attached distinguish them from Greek models. Again according to pictures, Etruscan soldiers preferred what is known as a linen cuirass, an originally Greek defensive accoutrement made of organic material with characteristic shoulder clasps,⁵⁴⁶ which because of their composition have virtually no chance of archaeological preservation. An especially good depiction of this defensive equipment with shoulder clasps and wings over the hip area appears in a fresco of the hero Geryon in the Tomb of the Orcus II in Tarquinia,⁵⁴⁷ although to be sure it comes from the succeeding Hellenistic period.

The warrior's tomb at Lanuvium in Latium is unusually equipped.⁵⁴⁸ In the first half of the fifth century, a man was interred there in a stone sarcophagus with a bronze helmet, a pair of greaves, a *machaira* (machete-like sword), and an anatomic cuirass. Current scholarship takes the anatomic cuirass to be a Greek development. The breastplate and the back piece from Lanuvium, however, did not cover the entire upper body; the shoulders and underarm area remained unprotected and bronze bands connected the breast and back plates. The anatomic cuirass from Lanuvium is thus not only one of the oldest of its kind, but also the predecessor of the South Italic-Samnite armor of the Early Iron Age, which was largely held together with such bronze bands.

Etruscan warriors occasionally wore disk armor, a feature especially widespread in Picenum and the Abruzzo. Good examples are provided by a set of this disk armor from Burial Mound 90 at Aleria on Corsica,⁵⁴⁹ an Etruscan colony on the island, and a picture of a warrior in a fresco from Ceri not far from Caere in southern Etruria.⁵⁵⁰

Etruscan helmet manufacture followed the native tradition of brimmed helmets, which does not mean that Greek-style helmets did not occur alongside them, albeit in reduced numbers. The typical helmet of the Archaic period is called the Negau helmet, after the findspot in Negova (Ger. Negau),

Slovenia:⁵⁵¹ it has a brim all the way around with a surrounding seam, a groove at the base of the cap, and a ridged cap, which lent the helmet special dependability. Above the ridge runs the soaring horse's mane crest. Helmets of this form have been found in considerable number in Etruria, and in other provinces of Italy and in the Alps as well. The helmet deposit of Vetulonia ("Mura dell'Arce") is the largest find, comprising some 125 helmets of this type.⁵⁵² Fifty-five of the helmets carry the Etruscan inscription "belonging to Haspna," but we have no idea who Haspna was. It may be supposed that these helmets were dedicated to the gods on the occasion of a military victory in Vetulonia. Two Negau helmets, along with a Corinthian helmet, were dedicated to Zeus in Olympia bearing inscriptions to the effect that the three helmets were seized in the maritime battle of Cumae near Naples in 474 by the victorious Syracusans under Hieron of Syracuse.⁵⁵³ The fateful maritime victory at Cumae cost the Etruscans primacy over the Tyrrhenian Sea.

Greek helmets, as opposed to Negau helmets, appear in quite limited numbers. In the late Archaic period, Chalcidian helmets came more and more into favor. They derive from a Greek form, but Etruscan craftsmen developed an Etrusco-Chalcidian type, often with figural crest-holders.⁵⁵⁴ The most beautiful examples come from Vulci. The forehead portion of one is decorated with a scene of the battle between Apollo and Hercules around a tripod,⁵⁵⁵ and the cheek pieces of one from a tomb in Todi are adorned with figures.⁵⁵⁶ This type of helmet is also frequent in Etruscan depictions, continuing into the successive Hellenistic period.

Offensive weapons were made of iron almost exclusively. Alongside lance heads, an important role was played by the longsword, corresponding to the Greek *xiphos*. This period also saw the *machaira*, a single-edged slashing sword, which is also preserved in Greek weaponry.⁵⁵⁷ Axes no longer played any significant role among armaments.

5The Classical and Hellenistic periods (450–250 BCE)

In the Hellenistic period, the Greek arms components, such as the hoplite shield, linen armor, and greaves, continued to be used, but alongside them appeared the bronze anatomic cuirass, such as the one found among other things in the "Tomb of the Warrior" in Orvieto-Settecamiini.⁵⁵⁸ This protective gear covered the entire upper body and reproduced the musculature of an athlete as "decoration." Etruscan anatomic cuirasses usually do not depict the nipples, which is distinct from southern Italian examples that likewise principally date from the fourth century. Worthy of mention, though unique, is the lamella cuirass worn by the "Mars" of Todi,⁵⁵⁹ a life-size bronze statue of a warrior. Linen armor with shoulder plates has metal scales sewn on in

horizontal rows. The greaves of the Hellenistic period feature a realistic representation of the musculature of the calves.

In helmets once again the Etruscans went their own way. After 400, the Negau helmet appears only in a grandiose variant along the Ligurian and southern French coast. In Umbria, there are many bronze helmets with forehead grooving,⁵⁶⁰ found in different varieties. But bronze helmets with a knob at the top and a neck guard became standard.⁵⁶¹ This originally Celtic form, which in Celtic lands was made of sheet iron and reached Italy with the Celtic invasion, was taken up by Etruscan craftsmen and reworked in the Etruscans' trusty material, bronze. The early examples from the fourth century still have the typically Celtic cheek pieces with three cockades; they derive from anatomically correct cheek pieces. These helmets were the standard equipment not only for Etruscans, but also for Republican Romans. The spread of the late variants in Sicily, southern France, and Spain is certainly connected with the rise of Roman power in these regions. The late representatives of these helmets no longer have cheek pieces.

Alongside the characteristically Greek longsword and *machaira*, the Celtic La Tène sword with iron sheath was also included in Etruscan weaponry, taken over from the Celtic tribes that had successfully invaded Italy.⁵⁶²

In Late Iron Age Etruria, there still appear offerings of weapons. The best examples come from the weapon deposit from Populonia–San Cerbone,⁵⁶³ which contained a few helmets and a large number of iron weapons, especially spear and lance heads, and the deposit from Talamonaccio near Orbetello,⁵⁶⁴ which comprised a large number of lance and javelin points.

The javelin points from Talamonaccio, which were part of Roman armaments, indicate that during the third century, the Etruscans had lost their independence and bore allegiance to the Romans. This brought an end to the independent development of weaponry. Moreover, after the fourth century, weapons were hardly ever deposited in Etruscan tombs. As an echo of this many-centuries-old burial custom and the associated warrior ideology, weapons were represented in tomb reliefs and wall paintings, for which the famous Tomb of the Reliefs in Caere⁵⁶⁵ and the Tomba Giglioli in Tarquinia (Colour plates 40–41)⁵⁶⁶ provide eloquent testimony. Pictures of greaves, anatomical cuirasses, helmets, and shields replaced offerings of weapons.

12Society

Abstract: The basic unit of Etruscan society was the family, established in a lawful marriage, which also formed a residential unit. Presumably there existed in Etruria an institution comparable to the Roman *pater familias*. Women enjoyed a somewhat public existence but were excluded from political office; female cultic activity in public service is difficult to verify. The onomastic system based on *gentilicia* shows that the individual was defined primarily by his membership of a broader community of descendants, membership which was transmitted in the father's line. The importance of the *gens* changed over time; while in the Orientalizing period and again from the fourth century BCE it played a certain role, this appears to have diminished considerably in the sixth and fifth centuries.

A strongly hierarchical society with unequal division of wealth and power was typical for the Orientalizing period, which was dominated by the *principes*. In the course of the sixth century, a number of factors led to the formation of new social strata and the establishment of a broader urban upper class. Beginning in the fourth century, the circle of those who shared in political power once again tightened more strongly. A small oligarchical and very prosperous upper class dominated the Hellenistic city-states of Etruria.

We are considerably less well informed about the middle and lower social strata. An urban middle class must have begun to come into being in the Archaic period. These citizens certainly had to perform military service, but their integration into the political life of the community is unclear. In the later sixth and the fifth centuries there may well have been a free peasantry owning modest amounts of land. As for the lower classes of population, they comprised an urban proletariat and lower rural classes. Beginning in the second half of the fourth century, considerable social tensions arose, especially in the strongly industrialized cities of northern and inner Etruria, but a clear distinction between discriminated Etruscans and real slaves (mostly foreigners), whose numbers strongly increased during the fourth and third centuries, sometimes proves problematic.

The liberalizing tendencies of the Hellenistic period led on the whole to a substantially more varied social spectrum than before (e.g. new forms of marriage, freedmen). With the *lex Iulia* of 90 BCE Etruria definitely became part of the Roman world.

Keywords: Family, *pater familias*, *principes*, upper classes

Introduction

The reconstruction of Etruscan society is an undertaking afflicted with numerous uncertainties; much must remain (for the time being) unclear and in the dark. This is due above all to the problem of sources: the literary output of the Etruscans in the original (setting aside the *Liber Linteus*) is entirely lost.⁵⁶⁷ Through Roman intermediaries there have survived fragments of religious writings (especially from the *disciplina etrusca*), while historical, geographical, philosophical, and political texts are entirely absent. Along with

them went any sort of self-presentation and self-appraisal of Etruscan circumstances. The only available perspective is that of outsiders—that is, some, albeit not much, evidence from Greek and Roman authors who, for differing reasons and with varying quality, have remarked on Etruscan society. The most important role in the reconstruction of Etruscan social history is thus naturally played by the primary sources, namely the epigraphic material and archaeological finds and results. The quite numerous inscriptions (around 13,000, including single letters) provide important information about family structure, though in most cases they are very short and relatively limited in content, since the vast majority of them come from funerary contexts.⁵⁶⁸ Longer inscriptions with more complex content are rather rare and mostly not comprehensible to us in all details. New epigraphic finds, however, continue to enrich our understanding. A central role is played by archaeological finds and results, among which the sepulchral sphere is of great importance in Etruria. In a way, it represents a mirror image of the society of the living, but a distorted and ideologically highly freighted one that hence must be evaluated with care.⁵⁶⁹ Other approaches important for our inquiry, such as excavations of settlements (which can also provide information on the life of the lower classes)⁵⁷⁰ and the investigation of the cultivation of rural areas, remain in their infancy.

Making things more difficult, sweeping statements and false as well as over-interpretations of older research in the area of Etruscan social history have, to some extent, a long shelf life, which is due to the fact that supposedly settled knowledge is generally only reluctantly abandoned. The best example is the myth of Etruscan matriarchy created in 1870 by J. J. Bachofen, which, though utterly untenable, in weakened form strongly influenced subsequent opinion speaking of Etruscan “mother culture”.⁵⁷¹ In fact, for the conservative patrician from Basel in Switzerland, the Etruscans were also a means to an end; he wished to denounce the moral decay of an entirely “material” society.

Despite these unpromising precursors, a reconstruction in outline of the society or, better, the societies of Etruria is achievable. For this purpose, below we separate the description of the rather static, scarcely changing basic structures of the Etruscan family, which functioned as the nucleus of social organization, from the description of the various social classes, since their development and existence interacted much more strongly with the economic and historic-political development of the Etruscan city-states. “The Etruscans” is not an undifferentiated mass of people, but a juxtaposition of politically and administratively independent state entities, which naturally resulted in distinct cultural, economic, and of course social developments. By the sixth century BCE at the latest, however, the Etruscans must have considered themselves a linguistic and cultural unity. The existence of treaties between the individual city-states, permitting commercial and personal contacts (similar to *ius connubii* and *ius commercii* of the Latins), is extremely probable. In modern terms, we are not dealing with a federal state in historical times (with uniform

citizenship), but with an—albeit rather loose—ethnically based confederation.⁵⁷²

1Early times

The Final Bronze period in Italy (twelfth–eleventh centuries BCE) is characterized by the widespread phenomenon of cremation with subsequent urn burial (called Proto-Villanovan). The sometimes extensive urn fields present a relatively uniform picture of interments in the form of individual burials without great social distinctions, which does not necessarily mean that there were no leaders or persons with specific religious-magical authority. Especially in southern Etruria—northern and central Etruria differed—Proto-Villanovan-period single graves and small groups of pozzo graves, which probably represent family plots, are also known. Generally speaking, the south Etruscan Tolfa-Allumiere zone is where material differentiations probably denoting socially prominent groups of persons are first found.⁵⁷³ Large seventy to eighty square meter huts could represent dwelling places of extended families, though smaller units (for the nuclear family?) appear to have existed too (e.g. Sorgenti della Nova).⁵⁷⁴

The living conditions in the Early Iron Age (tenth–ninth centuries) appear not to have differed greatly (e.g. Tarquinia, Calvario), although population was increasingly concentrated in the core settlements (see [chapter 33](#) Pacciarelli). The hut floor plans that differ in form and dimension, though, probably express not only social-familial distinctions, but also functional and chronological differences.⁵⁷⁵ In the course of time, however, a certain tendency must be recognized toward housing that provided room for the nuclear family.⁵⁷⁶ In parallel, the concept of private property—including also and especially land—must have acquired significance in the Early Iron Age, as opposed to common possession by a larger group. The housing unit will also have constituted a production unit flanked by specialists in metalworking and also to some extent pottery manufacture from outside this unit.⁵⁷⁷ Within the cemeteries, the grave goods clearly mark the different responsibilities and roles of the sexes. A few men's graves more lavishly equipped with weapons and hut-urns appear to be associated with leading roles within the community (e.g. in Tarquinia).⁵⁷⁸ Colonizing movements to northern, eastern, and southern Italy presuppose the existence of leaders. The women responsible for the household were, as a rule, characterized by tools for wool and cloth production (spindle whorls, spools, occasionally loom weights). Although social stratification begins to become recognizable in the material record, in this early phase no really great economic differences can yet have existed between the families. Whether initially a uniform funeral ritual that masked social differences was ideologically required is a matter of scholarly

dispute.⁵⁷⁹

While the older necropolises reveal larger groups of graves, which probably represent extended kinship groups and perhaps also dependency relations, in the great proto-urban centers of Etruria the model of the family with the central husband-and-wife couple appears to increase in significance. The small to medium groups of graves show different consistence, but common to them was probably an organization by internally stratified family groups, whether the nuclear family or the extended family.⁵⁸⁰ Fertility and sexual potency guaranteed family continuity, and the legitimacy of the progeny with regard to rules of inheritance gained increasing significance. A special role was assumed by the founding father. The eighth century may have seen a developed ancestor cult.⁵⁸¹

20 On the structure of the Etruscan family

In principle, the *gens* as descent-community from a common ancestor in the sense of a larger, superordinate unit must be distinguished from the small or nuclear family of father, mother, and children. Already before the Early Iron Age, groupings can be recognized in the necropolises that probably reflect extended family bands in a wider sense, yet their organizational structure remains unknown to us. Only with the appearance of epigraphic sources beginning around 700 BCE do we acquire deeper insights into Etruscan naming practices, and thus into the typical family structure as it must have been common at least since the late eighth century. The *nomen gentile* or *gentilicium* appears to be the most important part of the name of an individual—that means one's status was primarily defined by one's membership in a descent-community (Lat. *gens*).⁵⁸² This naming practice is a constant through all of Etruscan history comparable to the Italic-Roman world, whereas in ancient Greece the individual name remained the core. The *gentilicium* combined with a *praenomen* (= binomial nomenclature) designated a free male or female person with citizenship status, its transmission occurred in legal marriage strictly patrilineally. Unilineal lines of descent generally follow the need for clear rules of succession through the generations. From a morphological point of view, various types of *gentilicia* can be distinguished in Etruscan; in pre-Hellenistic times *gentilicia* of patronymic origin (with suffix *-na*, *-ni*, *-nie*, *-ra*) predominate.⁵⁸³

The concrete responsibilities of the *gens* in historical times are unclear. In case there were no close agnatic relatives, it was probably—similarly to the situation in Rome—responsible for family-law concerns such as inheritance, care duties, guardianships, etc., and functioned originally as a protective community as well. As the inscriptions show, marriage in Etruria was always strictly exogamous, thus outside one's own *gens*.⁵⁸⁴ The feeling of solidarity

between the individual branches of a *gens* appears to have changed repeatedly in the course of Etruscan history; the significance of the gentilicial system in the structure of the state alters parallel to this. It must have been high especially in the Orientalizing period,⁵⁸⁵ and then again from the fourth century onwards among the ruling families; while forms of organization based on gentilicial bonds in the sixth and fifth centuries were less prominent. The grave structure points in this direction: in the Orientalizing period, the custom of monumental tumuli expanded throughout Etruria, which in their inner chambers had space for several members and/or generations of a family (the stone circle graves in Vetulonia and environs are comparable). In some cases we can speak of an extended family in the sense of a *gens*, e.g. in the large Tumulus II at Caere, which was in use from the early seventh to the second half of the sixth century and probably contains the resting places of several branches of a *gens* (Tomb of the Hut, Tomb of the Dolia and Fire Dogs, Tomb of the Beds and Sarcophagi, Tomb of the Greek Vases).⁵⁸⁶ In the Archaic period, from the mid sixth century on, the phenomenon of chamber tombs with more than one room and multiple burials declined, so that the relatively small, mostly one-room chamber tombs with wall paintings in Tarquinia and the cubic tombs of Caere and Orvieto more clearly concentrate on the nuclear family. Beginning in the fourth century, the element of the *gens* recurred very strongly, at least as concerns the funerary sphere, with the so-called “gentilicial” tombs.⁵⁸⁷

In the Late Etruscan period, the term *laut(u)n* must have had the meaning “extended family, descent-community, *gens*”. It appears in the contract on the Cippus Perusinus and in two funerary inscriptions in Tarquinia and Perugia referring to the foundation of the tomb.⁵⁸⁸ Another term expressing familial connection is known from rock facade tombs in Castel d’Asso and from one of the necropolises at Tuscania: *neś(l)* = “descendants” (of a person) or “family”(?).⁵⁸⁹

This leads us to the free small or nuclear family, the true basic unit of Etruscan society.⁵⁹⁰ In historical times, the married couple was bound together in serial monogamy; a few Late Etruscan inscriptions appear to attest to remarriage after the death of a spouse (e.g. *ET*² Ta 1.164, 1.166–68). Upon marriage, the woman normally left her family of origin (this practice is called patrilocal or virilocal), but retained her complete birth name (*praenomen* and *nomen gentile*). The father transmitted his *nomen gentile* to his sons and daughters (patrilineal) and represented the family to the outside world; this is quite clear from the funerary inscriptions engraved over the tomb entrances in Archaic Orvieto, which usually name only the father of the nuclear family. Patriarchal organization must be assumed, some evidence points to the possibility that in Etruria too an original powerful father figure along the lines of the Roman *pater familias* existed; perhaps the formation of an onomastic system based on the *nomen gentile* should be seen from this point of view.⁵⁹¹ This would mean that only upon the death of the father do his sons become

sui iuris and on their part *patres familias*. An interesting document for the depths of the generations is the late third century Tomb of the Volumni in Perugia, which, along with three brothers of the *gens* Velimna (two of them singled out as builders of the tomb), also contained the urns of the father and grandfather, whose mortal remains were probably transferred to the newly erected family tomb and laid to rest in purpose-made urns (*ET*² Pe 1.306–12).

In the course of time, the binomial nomenclature was supplemented with additions that further explained the position of the individual within the family: the filiation (the father's *praenomen* in the genitive) was very common beginning in the sixth century, the matronym (the mother's *nomen gentile* in the genitive, occasionally in combination with her *praenomen*) mainly appears beginning in the fourth century. It served both to better differentiate the individual within a *gens* and very likely to document family pride in the cognate line. Especially in the Late Etruscan period, the gamonym (the name of the husband)—with or without the addition of *puia* (“wife”)—was usual for married women. The *cognomen*, usually a family *cognomen*, first appears in the third century.⁵⁹² There were in Etruria no fixed rules for the use of these name additions.

Unfortunately, Etruscan inheritance law is entirely unknown to us.⁵⁹³ Parallel to the situation in Rome, inheritance by daughters, which made possible the accumulation of property in female hands, seems highly probable. The kinship terminology deduced from tomb inscriptions is very one-sided: while the vertical line is relatively well documented (*apa* “father,” *ati* “mother,” *clan* “son,” *sex/c* “daughter,” *apa nacna/papa* “grandfather,” *ati nacna/teta* “grandmother,” *papals/tetals* “grandchild”), we know very little concerning the terminology of horizontal relationships⁵⁹⁴ – only *ruva* “brother” and *nefts* “nephew” are attested a few times (especially in the Golini I Tomb in Orvieto).⁵⁹⁵

The responsibilities of women were traditionally defined in Etruria, too—above all, they lay in the area of childbearing and the domestic sphere. Special responsibilities outside the home, such as cultic duties, may be assumed, but—in contrast to Greece or even other peoples of ancient Italy—are difficult to prove.⁵⁹⁶ From the political life and state administration, Etruscan women were entirely excluded. On the other hand, Etruscan women stood out through a certain public presence: as wives they participated in upper-class banquets at home and elsewhere, they were present in the audience for games and contests, and as mothers they certainly occupied a position of respect within their families similar to that of the Roman matron.

30 On the hierarchization of society: the different social classes

In the course of the eighth century BCE—that is, in the second phase of the Early Iron Age—tomb furnishings allow us to recognize stronger and stronger economic distinctions. This can easily be seen e.g. in the tomb arrangements of the Quattro Fontanili Necropolis in Veii.⁵⁹⁷ Richly furnished children's graves document the transition to an aristocracy by birth and a true class society. This did not happen simultaneously throughout Etruria: in the southern part of the core area the development happened sooner (second half of the eighth century) than in the north; the colonial regions were also affected (e.g. Pontecagnano, Verucchio).

A strong hierarchization of society with unequal division of wealth and power is typical of the Orientalizing period (last quarter of the eighth to the beginning of the sixth century). In the seventh century we speak of an “Etruria of the *principes*”, of powerful noble families, who set a monopolistic claim on wealth and power. Their economic base was the possession of land (agriculture and cattle raising),⁵⁹⁸ flanked by the control over metal resources (especially iron), and interregional trade routes. The ostentatious display of wealth and status symbols legitimized the claim on power of this small elite, which left its archaeological mark throughout Etruria in the so-called princely tombs.⁵⁹⁹ High-ranking men represented themselves with their armaments as warriors, although this practice waned in southern Etruria—as opposed to the northern part—during the seventh century.⁶⁰⁰ The rich equipment of the female members of the ruling families was an integral part of princely self-representation. As elements of alliances (through marriage) and guarantors of family continuity, these women were important members of the elite, even though they did not enjoy equal rights.

In contrast to this small ruling class stood larger freeborn parts of the population without noticeable economic possibilities, probably also lacking basic rights of political participation (e.g. farmers, craftsmen), who found themselves to a considerable degree dependent on the *principes*. Unfortunately, our sources are poor in this respect; unfurnished burials around the major tomb areas can be interpreted as representing a dependent lower class.

The quick urbanization process that was already setting in in the seventh century (with division of labor, settlements with higher population density),⁶⁰¹ the increasing demand for specialized crafts, the major role of interregional trade, and probably better organized and more productive agricultural techniques⁶⁰² led, during the sixth century, to the formation of new social strata and ultimately to the establishment of a broader urban upper class, which also included wholesalers and workshop owners. The appearance of necropolises with uniform tombs arranged in neat rows (“cubic tombs”) is to be interpreted in this way. Good examples are provided by the Banditaccia necropolis at Cerveteri and the Crocifisso del Tufo necropolis at Orvieto;⁶⁰³ parallel to the sepulchral areas, a stronger spatial organization of the residential quarters is assumed too. In the second half of the sixth century, the

important cities of Etruria show a relatively broad, timocratically organized upper class. Possibilities for upward social mobility must have been limited (especially with regard to the integration of foreigners).⁶⁰⁴ A similar impression is offered by the (in most cases) quite small but extensively painted chamber tombs beginning around 540 BCE in Tarquinia, a town which in contrast to Orvieto possessed a long aristocratic tradition. The members of the local upper class cultivated their horizontal connections, were cautious about external equality, and claimed political leadership of the republican city-states, as they provided the annual rotation of magistrates. The old *gentes* of the Orientalizing period survived to a certain extent (see, for example, the Tomb of the Greek Vases from the second half of the sixth century in Tumulus II of the Banditaccia necropolis at Cerveteri), despite the decline in significance of the gentilicial structures.

Some sort of allegiance (similar to the Roman clientship) must have already from early times constituted the social glue between upper and lower classes. Only a very few sources are available; followers and dependents in the circle of a noble lord, who also provided army services as needed, are nonetheless to be expected.⁶⁰⁵ The building type of the atrium house, whose architecture also served for the representational duties of the master of the house and his social responsibilities, appears to have good Etruscan roots.⁶⁰⁶ It is obvious that the character of these allegiances must conform to the developments of the time.

In Etruria the circle of those who participated in political power was always rather small. After a certain torpor during the fifth century,⁶⁰⁷ it strongly tightened once again during the fourth century. Now a few great *gentes* raised the claim of sole rulership in the state (called *principes*, *domini*, *despôtai*, *dynatôtatoi*, etc.). Their prosperity was based on land ownership (large-scale land-holding) and the labor of the lower classes; internal solidarity was promoted by regional and supra-regional marriage policy.⁶⁰⁸ Regarding late Etruria, the ancient authors frequently speak of *tryphē*, which was expressed in overwhelming opulence.⁶⁰⁹ The fact is, in Hellenistic Etruria a small, very prosperous and oligarchic upper class must have existed that surrounded itself with numerous servants and demonstrated its wealth as the expression of high prestige.

Considerably less well documented are the population groups perched lower on the social ladder. An urban middle class, however, must have begun in the Archaic period: the rock façade tomb area in inner Etruria shows many tombs of an average level around the smaller urban centers, in both the sixth century and the Late Etruscan period. The floor plans of houses in planned cities like Marzabotto also reveal a broader middle class in the second half of the fifth century.⁶¹⁰ A similar situation is attested by the necropolises (including their onomastic material) of the economically flourishing cities in Hellenistic northern and inner Etruria (e.g. Perugia). In line with this is an observation made by Posidonius (apud Diod. Sic. 5.40), namely that in Etruria most of the free men own houses of different, individual kinds. These citizens

were certainly liable for military service; entirely unclear is their integration into the political life of the city-state; so far, we are scarcely informed as to the existence and competences of possible people's assemblies.⁶¹¹ Phenomena of tyranny, as are suggested in the late sixth or fifth century by the Pyrgi gold tablets for south Etruscan Caere in the person of Thefarie Velianas,⁶¹² speak for a certain (anti-aristocratic) possibility of mobilizing the middle and lower classes. Furthermore the economic crisis of the second half of the fifth century is likely to have hit the urban middle classes of the south Etruscan coastal cities quite hard. In the later sixth and the fifth centuries there may have been a probably free peasantry with medium-sized landholdings, as the few archaeologically attested farmsteads suggest.⁶¹³ This appears, though, to have been a short-lived phenomenon; unfortunately our information in regard is very sparse.

As for the lower social classes of the population, they comprised—depending on the development of the individual settlements—an urban proletariat, whose members, similar to Rome, probably were free in their person (e.g. day laborers), but without their own property, and also lower rural classes. Different forms from oppressive to less oppressive dependency are theoretically possible in this (perhaps originally free) peasantry. Rare and scattered indications in ancient literature allow no generalizable conclusions to be drawn.⁶¹⁴ Small rural land ownership appears to be a possibility again in late inner Etruria,⁶¹⁵ while southern Etruria from the third century onwards had to face extensive land confiscations by Rome and suffered to a higher degree from the pauperization of the small local peasantry. Often cited is the complaint of Tiberius Gracchus in 137 BCE about the multitude of foreign slaves on the fields (*latifundia*) of southern Etruria (Plut. *Ti. Gracch.* 8.9).

A development corresponding to the Roman Conflict of the Orders (fifth–third centuries), which brought legal and finally political equal rights to the *plebs* (or better to its upper segment), is not attested for Etruria, although each city-state must be considered on its own and the general absence of sources advises caution. In the age of colonization (Po Valley, Campania), the social pressure of the lower classes could certainly be attenuated by land allotments. Internal colonization may be assumed after the crisis of the fifth century in the case of Tarquinia.⁶¹⁶ It remains open whether the absence of indications of social unrest in this city is to be attributed to the hazards of historical tradition or is in fact the result of this colonization activity or other measures that were taken. It is a fact, though, that, beginning in the second half of the fourth century, great social tensions affected especially the heavily ‘industrialized’ cities of northern and inner Etruria (Arretium, Volsinii veteres). Of course the often-unclear terminology of the ancient authors causes problems in the exact definition of the groups concerned (*plebs*, *servi*, *oikétai*).⁶¹⁷ The proportion of Etruscans who were socially and legally disadvantaged, but free in their person, and slaves (maybe also freedmen) is not always clear to distinguish, especially in the case of the Orvieto Revolt of 265/264 BCE (where perhaps a

mixed situation has to be assumed). A genuine slave rebellion encompassing wide parts of Etruria broke out in 197/196 BCE (Livy 33.36.1–3), and the problem was taken care of by Rome. Enslaved foreigners and probably also enslaved natives had already been found since early times in Etruria but, beginning in the fourth–third centuries, an increasing number of foreign slaves must be reckoned with, who came into use in the factories and mines, in the noble households, and the large agricultural enterprises of southern Etruria in particular. Depending on their assignments, they could have very different lifestyles.⁶¹⁸ The Roman agrarian laws of the late second and early first centuries BCE are probably the chronological framework for the so-called Prophecy of Vegoia—a pseudo prophecy with a political background, which documents the fear of the land-owning classes of Etruria of forced land cessions under the allies of Rome.⁶¹⁹

On the other hand, the general tendencies toward social liberalization of the Hellenistic period were also effective in Etruria: the old and rigid forms of matrimony became replaced by new forms *sine manu*;⁶²⁰ the possibility of divorce and remarriage led to complex interfamilial kinship relations. The appearance of nouveaux riches (such as the *Petru Scevaś* of the Tabula Cortonensis),⁶²¹ the stronger presence of freedmen (Etr. *lautni/θα*),⁶²² and the existence of new citizens of Italic origin in partly remarkable numbers (e.g. at Chiusi, Perugia)⁶²³ led to a considerably more varied spectrum in social life than in earlier times.

When, as a consequence of the Social War, Roman citizenship was assigned to all of Etruria in 90 BCE (*lex Iulia de civitate*), the social elite of the land had long since come to terms with the dominance of Rome. Thenceforth the Etruscan cities also participated in the social developments and internal political conflicts of Rome.

13 Feasts, Wine and Society, eighth–sixth centuries BCE

Abstract: Feasts in antiquity were public events and thus instrumental in shaping the political scene. They were organized via certain culinary and table-specific registers of consumption that were determined in each case by locally dominant social structures and power relations. This led to certain local and period-specific “consumption-scapes” with a sustained impact on the feasting culture of each local group, leaving their traces in the resulting archaeological finds that reflected those cultures. Such finds include, for instance, imagined and actual scenes in pictures, dwellings reflecting hierarchical structures (from imposing solidly constructed buildings to humble huts), dress codes of festive garments showing different statuses, and significant patterns in the storage and disposal of implements, dishes, food, etc.

All these material objectifications of commensal politics can provide information about the underlying society. Feasts and their material remains have therefore also acquired increasing importance in the study of Etruscan culture. The focus is particularly on wine and on the drinking and socializing culture that is associated with it. However, such research has often tended to neglect the interdependent cause-and-effect relationships that exist between wine, feasts and society. This is why we decided to emphasize precisely this point as a common link between all feasts and their underlying policies, as it will help us gain a better understanding of the historical process of transformation from the eighth century BCE *capi guerrieri* to the seventh century *principes* and sixth century *aristocrats*.

Keywords: feasts, wine, pilgrim flasks, *dinoi*, *olla*

Introduction: Societies are shaped by feasts—and feasts by societies

Feasts in antiquity were public events and thus instrumental in shaping the political scene. They were organized via certain culinary and table-specific registers of consumption that were determined in each case by locally dominant social structures and power relations. This led to certain local and period-specific “consumption-scapes” with a sustained impact on the feasting culture of each local group, leaving their traces in the resulting archaeological finds that reflected those cultures. Such finds include, for instance, imagined and actual scenes in pictures, dwellings reflecting hierarchical structures (from imposing solidly constructed buildings to humble huts), dress codes of festive garments showing different statuses, and significant patterns in the storage and disposal of implements, dishes, food, etc.

All these material objectifications of commensal politics can provide

information about the underlying society.⁶²⁴ Feasts and their material remains have therefore also acquired increasing importance in the study of Etruscan culture.⁶²⁵ The focus is particularly on wine and on the drinking and socializing culture that is associated with it. However, such research has often tended to neglect the interdependent cause-and-effect relationships that exist between wine, feasts and society. This is why we decided to emphasize precisely this point as a common link between all feasts and their underlying policies, as it will help us gain a better understanding of the historical process of transformation from the eighth century BCE *capi guerrieri* to the Orientalizing seventh century *principes* and sixth century *aristocrats*.

1Bronze pilgrim flasks and*capi guerrieri* (750–675 BCE)

In the Early Iron Age, characteristic flasks were made from sheet bronze in Veii, Tarquinia and Vulci. They were bronze imitations of Levantine flasks and apparently designed for the storage and transportation of wine enriched with aromatic resins. These pilgrim flasks were particularly in evidence in richly endowed graves of the ninth to early seventh centuries, along with various harnessing items (Volterra, Vetulonia, Chiusi, Bisenzio, Vulci, Vetralla, Tarquinia and Veii), and we can therefore conclude that bronze flasks served as status symbols for those with the highest social standing—the *capi guerrieri*.⁶²⁶

Clay and rarely bronze models of huts were used for the pyre debris and ashes of high-status individuals, thus indicating that the house-society was the basic communal principle in an Iron-Age village.⁶²⁷ It was characterized by communal dwellings in compounds. These were simply constructed dwellings, composed of several circular and rectangular structures.⁶²⁸ Big families were especially conspicuous because of their extended compounds and also their large quantities of supplies and denser concentrations of exotic and prestigious items. This permits us to draw conclusions about the social statuses and political authorities of the heads of such large “houses” within their social structures.⁶²⁹

This consolidation of political powers of a given house during the eighth century was also reflected in the special honors that were given particularly powerful *patres familias* at funeral rites. They were the only ones whose ashes were kept in clay or bronze replicas of the cultic huts of their big families. This exclusive right was highly symbolic as it expressed the person’s former headship over the cultic practice and interests of his “house.” In many cases a hut contained not only urns but also a funereal display of complex armory, numerous banquet dishes, rich decorative jewelry and garment accessories as well as luxurious exotic object. These items in graves acted as symbolic

reminders of the deceased person's great military prowess and his economic potency as a generous giver of gifts and feasts. Both were of central importance in making a good impression not only on the actual villagers but also on outside guests to the funeral, thus ensuring that the family was seen as sufficiently attractive for possible marriages or as an alliance partner.⁶³⁰ After all, the only way to ensure an exchange and transfer of resources and prestigious goods and thus to secure a leading local position was through a wide-ranging network of family relations and hospitality.⁶³¹

Such networks of leading houses during the Early Iron Age in central Italy are reflected, for instance, in the find-spots of Neo-Assyrian omphalos bowls. They were used as hospitality pledges which, under the gift-giving practice of the Phoenicians, spread all the way from the Levant to Gibraltar. This power of geographic distance and the symbolic value of such Neo-Assyrian bowls virtually predestined these items for use in funeral ceremonies, giving proof of a successful hospitality network, and they were therefore placed in the graves of the western Mediterranean elite. It also means that the relevant sites provide significant archaeological evidence of various nodes in a ritual exchange system between hosts and guests—a system that covered a wide range of ethnic groups.⁶³²

The items that reached central Italy through this trans-Mediterranean network included not only the Cypro-Levantine precursors of Etruscan flasks, but also fragrant Oriental resins that were indispensable for the spicy wine mixtures carried in the flasks.⁶³³ Moreover, it shows the beginnings of an Oriental-style “winemanship” whereby flask owners tried to distinguish themselves culturally from the lower orders of their society during the eighth century.⁶³⁴ Such profiling subsequently reached its heyday in the seventh century when an Orientalizing habitus became the distinctive mark of this period.⁶³⁵

2Dinoi and Orientalizing *principes* (650–575 BCE)

From the eighth century, westbound Phoenician and Greek migration meant that former guests and friends from foreign cultures were now living in the immediate vicinity. In central Italy, in particular, this led to continuous coexistence and ongoing interaction between elites with a wide range of ethnic backgrounds—Phoenician, Latin, Etruscan and Greek.⁶³⁶ The result was a multi-ethnic melting pot that created numerous new hybrid cultural achievements. One of them was the (clay) *olla*. This hemispherical wine-mixing vessel regularly featured among the banquet dishes that were placed in the Orientalizing graves of the elite. It is assumed to have been derived from Phoenician models, although its Etruscan name, *thina*, comes from its Greek synonym, *dinos*. In the case of this Orientalizing wine-mixing vessel, cultural

mediation may also have been conducted by Greeks, probably Euboeans from Pithekoussai or Cumae.⁶³⁷

A parallel process of indirect cultural transmission can be seen in an adaptation of alphabetical characters in Etruria in the early seventh century. Derived from *grammata phoinikia*, i.e. Phoenician letters, it originally came from the Levant.⁶³⁸ Nevertheless, it was introduced in Etruria via the Euboeans, as shown in the adoption of the Etruscan script on the Marsiliana d'Albegna tablet, in characters modeled on the Euboean script.⁶³⁹

The same elite grave that contained the Marsiliana tablet also revealed a bronze grater.⁶⁴⁰ Our current knowledge from archaeological finds suggests that graters, too, had been invented by the Euboeans. They seem to have reached central Italian graves as burial items for Orientalizing *principes* through the same channels as alphabetical characters.⁶⁴¹ One well-known piece of evidence is the silver grater from the Tomba Bernardini in Praeneste around 675, where it formed part of an exclusive silver drinking set and had therefore been placed into this burial chamber alongside a *dinos* with a strainer above the spout, from which a ladle was suspended. The *dinos*, with its grater and strainer, accompanied a wine jug and a bowl-shaped drinking vessel.⁶⁴² It was an indispensable accessory item for the Oriental-style “winemanship” of a princely house. This is confirmed by the Cypro-Phoenician silver bowl, which also came to light in the Tomba Bernardini where an enthroned reveler is shown enjoying his wine, using a suitable vessel. He is depicted in relief in the top row that adorns the vessel.⁶⁴³

It seems that the *principes* in Praeneste had cultivated a Phoenician-style wine-drinking culture where wine was prepared by adding aromatic substances, forming a gourmet mixture.⁶⁴⁴ Unlike in Phoenician culture, spices were not pounded in a massive clay mortar (It. *bacino-tripode*),⁶⁴⁵ but were grated with a grater, which the Etruscans had apparently taken over from the Euboeans together with the *dinos*.

When the Etruscan *principes* adopted the custom of reclining on couches at their banquets, they had probably learned this directly from the Phoenicians and not from the Euboeans.⁶⁴⁶ These *klinai* were used by *principes* as cultural indicators of their high social status and therefore continued to be their exclusive right during the seventh century. This right of exclusive reclining is documented, for instance, in the left-hand *dromos cella* of the Tomba della Nave (Tomb of the Ship) in Cerveteri, built in imitation of the banqueting hall of a contemporary mid seventh-century princely residence. The two stone benches that were carved out of the tuff on the two long sides of this burial chamber were designed in imitation of the bench-like elevations of two rows of seats. The head of each of these rows and thus the back of the burial chamber contained a stone version of a couch as the head of the U-shaped seating arrangement of this replica of a “banqueting hall.”⁶⁴⁷ An exclusive royal right to a *kline* was also in evidence at the Assyrian court at the time, as shown in the arbor scene in Ninive. Queen Ashursharrat is depicted enjoying

her wine on a throne-like seat, while her royal master and husband, Ashurbanipal, is reclining on a couch (Fig. 45.3).⁶⁴⁸

In northern Etruria a piece of furniture with a similar position was the princely throne, which also involved an exclusive right. Here, the deceased *princeps* would get himself “eternalized” in his burial chamber as though he were an Oriental ruler. An enthroned reveler before a sumptuous table that was laden with food and drinking vessel. Also, a *princeps* was shown as an elite warrior and military leader with decoratively engraved shields along the walls of his burial chamber as well as lances and battle axes on the ground. Sometimes the *princeps* was shown in a priestly function of killing sacrificial animals, as indicated by the presence of sacrificial hatchets and daggers.⁶⁴⁹

It shows that the social standing of an Etruscan seventh-century *princeps* was characterized by a princely table culture, by a sacred privilege to sacrifice animals and by authority in war. The architectural complex OC 1–3 in Murlo gives us a clearer idea of the mutual interaction between these pillars of princely power in Orientalizing Etruria.

The proto-palatial complex on the hillside plateau of Piano del Tesoro, 25 km south of Siena, was built in the second quarter of the seventh century and comprises three different buildings (Figs. 71.4.–71.5).⁶⁵⁰ The monumental longhouse (OC 1), which has been interpreted as the residence of the *princeps*, is 8.5×36.2 m and has mud brick walls on stone bases as well as a tiled roof with acroteria. Approximately 60 m south of OC 1 was the long workshop OC2 (6.6×51 m). Although this hall also had a brick roof, it was not supported by walls, but simply by three rows of wooden posts. The broadroom building OC 3, with its solid masonry bases (9.2×23.25 m) was located seven meters south of the residence OC 1 and divided into three rooms. This building, too, had vertical walls and a tiled roof with acroteria, so that it looked highly impressive. Because of its *cella tripartita* ground plan, OC 3 was probably an early type of building designed for cultic activities and feasts.⁶⁵¹

An interpretation of OC 1 as a princely residence is borne out by the large number of pottery fragments, bearing witness to a rich inventory of banqueting dishes. A small proportion came from Ionia, Corinth and Sparta. The lion’s share, however, consisted of *bucchero* and *impasto* ceramics locally made. The existence and use of bronze dishes is only indicated by the fragments of two vessels. Significantly, however, there were also ten *impasto olle* which were probably used for the preparation of spicy wine mixtures.⁶⁵²

In their appearance, the banqueting dishes that were found in OC 1 are directly reminiscent of the forms and functions of the commensal politics that characterized rigorously ranked societies. One dominant feature of such a society was its “merit and gift feasts,” which were given in order to establish and stabilize the existing hierarchical order and its ranks. This was achieved through the host’s rigorously graded preferential treatment of individual guests, with the precise calculation of time and resources spent on serving

each person. It included, in particular, different qualities of food and drinks and different qualities of the dishes that were used at table. To serve the highest-ranking guests, it was important to serve the most exquisite food and the finest mixtures of alcoholic drinks, obviously served on the most costly dishes made from precious metal. The next person lower down was often given somewhat cheaper dishes made of clay, but still valuable and still imported. Such dishes were given as gifts or were simply used to serve the food. Those on the next level in the hierarchy were given less costly imitations of those delicate ceramic import items, dishes that had been made in regional or local pottery workshops.⁶⁵³ When we place Corinthian, Ionic and Laconic drinking vessels on the honorific scale of a “merit feast” at the Murlo proto-palatial complex, it would come second in prestige value. The first place was taken by even more valuable banqueting dishes, made of bronze. Most of these metallic items, however, have not survived to the present day.⁶⁵⁴

In view of these requirements at “merit and gift feasts,” it was all the more important for the *princeps* of Murlo to be highly successful in his hospitality. As his residence was inland, he could only secure access to the “global” goods and merchandise traffic through hospitality ties with influential partners along the Tyrrhenian coast. This systematic hospitality and networking policy of the *princeps* in Murlo is also borne out by the *tesserae hospitales* made of ivory, of which fragments bearing different names came to light in the OC1 longhouse.⁶⁵⁵ It clearly seems that in Orientalizing Etruria, the formation of the elite involved a causal relationship between the region’s hospitality policy, “global” networking and control over prestigious goods. This was the only way one could ensure not only those much-coveted import goods but also the necessary non-local raw materials and input materials which—as in the case of the workshop hall OC 3 in Murlo—were then processed locally into costly cultic objects and valuable gifts under the supervision of the *princeps*.⁶⁵⁶

At the “merit and gift feasts” that were given at the Murlo residence complex a central role was often played by the *matrona* who handled, for instance, the allocation and preparation of the food and drinks. This included the fermentation of cereal and grapes into alcoholic drinks and, above all, the distribution of meat, which was still seen as a highly exclusive culinary delight in Orientalizing Etruria. This high-ranking function of the *princeps*’ wife is reflected in the frequent presence of knives in richly decorated women’s tombs in central Italy from the late eighth century onwards. These were knives used both for sacrificial purposes and for the carving of animals.⁶⁵⁷ This role of the high-ranking woman in a princely household is illustrated on the relief figures depicted in the middle row on a Cypro-Phoenician silver bowl in New York. It shows a ceremony in which men are bringing small and large horned livestock to a female ruler seated on a throne. The next image sequence shows the sacrificing of those animals. Two men have pinned a goat (?) to an altar while one of them is cutting the animal’s

throat with a sacrificial knife in his right hand. As the innermost row on the bowl shows, this sacrifice ceremony formed part of the preparations for a palatial feast in a “sacred grove.”⁶⁵⁸

As well as focusing on the central role of the *matrona* in organizing opulent feasts, the sacrifice scene on the silver bowl in New York also shows that the animals, which were received for meat consumption, actually had to be killed and that this clearly required a place of sacrifice or an altar. Commensal politics therefore always involved religious practice. As individual *capi guerrieri* rose to positions of *principes* and thus became redistributors and generous hosts, this development was accompanied by drastic changes in the field of religion. In seventh-century Etruria (Tarquinia, Caere and Veii) and Latium (Satricum) a number of prestigious *sacelli* were built on the grounds of ritually destroyed cultic huts.⁶⁵⁹ Each of these “sacred houses” had a foyer, hipped roof and an earthen cover and served as a new place of devotion for honoring the ancestors of leading families as heroes or even worshipping the same as gods. The *capo guerriero* had now become the local or even regional master of cultic and ritual practice, which formed the religious basis for his new position as *princeps* outside the family.⁶⁶⁰ If it is true that the three-room broadroom house OC 3 in Murlo is a *cella tripartita*, then this building should be such a “sacred house” which functioned as a regional center for ancestral and cultic worship as early as 650. Access to this building would have been controlled by the *princeps* who had his residence in OC 1.⁶⁶¹

3 Feasts, *klinai* and aristocrats

The religious condensing process, whereby specially revered ancestors were given near-divine or even divine status, started with the ascent of individual *capi guerrieri* to the positions of *principes*. During the sixth century, this practice led to widespread monumentalization. The “sacred houses” had imposing peristyle temples built around them and no longer served as feasting venues.⁶⁶² Instead, festivities were held in purpose-built halls and banqueting houses. Like their precursors, the palatial residences, these newly established sanctuaries with altars and banqueting rooms served as ceremonial service centres (e.g. in Veji-Portonaccio, Montetosto, Pyrgi and Graviscae in Etruria and Satricum in Latium).⁶⁶³ In the late sixth century, this move of regional distribution centers from the residences of the *principes* into urban or rural sanctuaries for the surrounding regional settlements was again accompanied by lasting changes in the fields of religion and feasting.⁶⁶⁴

To get a clearer idea, it is worth looking at the black figures in the sacrificial scene on the Ricci hydria in Rome around 520. On its shoulder frieze we can see a bearded man with a long luxurious gown, a red cloak and a kantharos in his right hand—apparently a priest supervising acts of sacrifice

and the preparation of the meat from the sacrificed animals, ready for the feast. We cannot tell from the frieze whether this figure is a king or an oligarch with priestly sacrificial duties.⁶⁶⁵ However, there is no high-ranking woman. The relocation of communal feasts from the house of the *princeps* to the central sanctuary of regionally associated aristocrats obviously meant that the master's high-ranking wife lost her role as feast preparation supervisor and was therefore no longer in charge of the organization of these opulent occasions. This gave her time and leisure to sit or even recline at the table, dine with her guests and entertain them with her successful flair for conversation. From the second third of the sixth century, this new commensal role of the Etruscan high-status women was suitably celebrated in depictions of banquets which adorned the terracotta panels of palaces and the walls of aristocratic tombs, following the iconographic examples of Greek symposium pictures.⁶⁶⁶

Not only did this emulation of Ionic and even Attic culture impact the general Etruscan presentation of banquets in contemporary images, but even its objects—that is, its furnishings and dishes—became increasingly Greek from the 560s onwards. Drinking vessels were now dominated by Greek-style bowls, and the *dinos* or *olla* was replaced by the *krater*.⁶⁶⁷ The former splendor and Oriental-style exoticism had been ousted by the ideal of distinguished “winemanship”, as practiced by the elites of the late Archaic period between Lydia and northern Etruria. This symposial *haute culture* was reflected in the microcosm of the banquet with its proper etiquette and correct taste,⁶⁶⁸ which then influenced the behavior of the elite in the microcosm of the increasingly urbanized centers of Etruria, so that the banquet became an instrument that assigned individuals to specific cultural places in a stratified and refined society.⁶⁶⁹

14 Banqueting and food

Abstract: Archaeological evidence and imagery give a clear picture of the development of banqueting as a social arena and, from the Orientalizing period, a status symbol for the elite. However, everyday diet of the Etruscan population, in particular middle and lower social classes, was most likely much more basic. Faunal and plant remains, dental wear and chemical analysis of bones offer the first tantalizing evidence of regular Etruscan dietary habits.

Keywords: funerary banquet, wine, komos, diet

1 Iron Age

The earliest evidence for banqueting dates back at least to the Villanovan period, specifically to its later phases, when sets of grave goods became progressively less basic and began to include vessels for food, remains of which sometimes survive. Vessels and food residues have been found both next to cinerary urns as the personal share of the deceased, and removed from burial locations, in which case they are likely evidence of funerary banquets. In addition, food offerings were burnt alongside the deceased, as shown by the animal and plant remains found in the debris of the pyre.⁶⁷⁰ Funerary banquets may also be represented on some Villanovan urns decorated with schematic seated figures.⁶⁷¹

In northern Etruria and the Po Valley, components of the Villanovan burial customs survive in the Orientalizing period. Here food is set on tables in front of the cinerary urn, which represents the physical presence of the deceased after the destruction of his or her body.⁶⁷² In the exceptionally well preserved case of Tomb 85 of Verucchio there are three wooden tables—one for drink, one for meat and fish, and one for fruit.⁶⁷³ In the territory of Chiusi urns have strongly humanized features and are placed with symbols of rank on thrones in front of which tables are set, as if the dead is enjoying a banquet.⁶⁷⁴

2 Orientalizing period

Between the Villanovan and the Orientalizing period the banquet developed, and its function as status marker was strongly emphasized, a character that it

probably did not originally have.⁶⁷⁵ In fact, the transition to the Orientalizing period corresponds to a dramatic increase of privileged status symbols, especially in southern Etruria, Latium Vetus and Etruscan Campania, where elite burials are characterized by the ostentatious display of valuable and frequently exotic banquet instruments.⁶⁷⁶ A new type of banquet spread across central Tyrrhenian Italy, which centered on the consumption of wine and meat. Individuals of “princely” status—a status that emerged from the formation process of aristocratic clans—display a lifestyle based on *truphē* (luxury) and *habrosunē* (refinement and splendor) and modeled after the Near Eastern courts and the Eastern Greek aristocracies. The banquet ceremony is one of the principal expressions of that lifestyle. The question of the origin of this social custom and its modes of transmission is still open. The Greek component has been favored for a long time, but scholars have recently turned their attention to the Near Eastern model and the *marzeah*, a ceremony of the Syro-Palestinian area in which high-ranking individuals drank wine together, celebrating their ancestors and marking their own privileged status.⁶⁷⁷ Direct acquisition of Near Eastern customs is confirmed by the presence in Etruscan tombs of tripod bowls used as mortars to grind spices and mix them with wine, following a custom typical of northern Syria and the Phoenician colonies of the central Mediterranean.⁶⁷⁸ The presence of an attendant with a fan in one of the earliest representations of banqueting in Etruria, the urn of Montescudaio (mid seventh century BCE), is also a typical Near Eastern element (Fig. 45.9). From Greece, on the other hand, were imported wine vessels,⁶⁷⁹ for which the Etruscans used names borrowed from Greek,⁶⁸⁰ and the custom of adding grated cheese to wine.⁶⁸¹ It must be remembered, however, that the banqueting with wine developed in the Greek world after those same Near Eastern models, and attempting to distinguish clearly what is Greek from what is Near Eastern is neither easy nor appropriate, especially in central Italy, where the two components coexisted and blended. Between the eighth and the early seventh centuries BCE, banquet culture became one of the most important components of a sort of cultural koine that the Etruscan aristocracy shared with their Greek, Latin and Cypriot counterparts. The model of the “Homeric feast” is not only suggested by the comparison between the elite burials of southern Etruria, Latium and Campania with the burial customs described in the Homeric poems, but is also confirmed by documents like the “Nestor’s cup” of Pithekoussai, which shows that the Homeric world was a constant ideal and cultural reference in banquet venues. In turn, strong Near Eastern models have been recognized in the Homeric banquet customs, and the settlement of Pithekoussai, even though established by Greeks, had pronounced Eastern components along with Etruscan and Italic ones.

From the Near East also came the custom of banqueting and drinking wine while reclining on a couch, which developed in the eighth and seventh centuries in the Syro-Palestinian region, and spread to Greece and

Mesopotamia.⁶⁸² The reclining banquet replaced—even though not immediately and not at the same time in all areas of Etruria—the seated banquet that is still found in the earliest representations, such as the urn of Montescudaio, bucchero vessels, and perhaps the terracotta figures of the Tombs of the Five Chairs of Caere.⁶⁸³ The new fashion was introduced roughly at the same time in Etruria and in Greece, as attested by the lid of the urn of Tolle (ca. 630–620 BCE).⁶⁸⁴

In the Orientalizing period a complex ritual of food and wine consumption developed, which expressed the status of the participants by equating them to regal and heroic figures, from the Eastern kings to the heroes of Homer, through the use of precious objects and the presence of assistants and musicians, creating a splendid, luxurious and almost divine setting. The banquet was one of the most important forms of aristocratic self-representation, and in South Etruria even replaced the traditional warrior role in burial customs. A large part of the sumptuary goods acquired by the Orientalizing elites is made up of banquet instruments of Eastern and Greek manufacture and/or typology. Near Eastern objects included cups of silver, bronze, glass and ostrich egg; jugs of silver or mixed materials; metal flasks; red-slip dishes and jugs, and bronze cauldrons on stands. The latter could be used to boil meat, a practice which may allude to divine status, since this method of cooking is mentioned in Greek myths dealing with regeneration and rebirth and is thought to refer to the time before the gods separated their table from that of the mortals. Their main function, though, was to hold wine, as confirmed by some of the earliest banquet representations.⁶⁸⁵ From the Greek world came cups, kraters and other vessels, which were soon imitated in workshops established by immigrant potters.⁶⁸⁶ Orientalizing elite tombs also contain andirons, spits, and knives, all used for roasting meat. The association of banquet with meat consumption and sacrifice show the protagonists of banquets as mediators between men and the divine, fortifying their status and authority.⁶⁸⁷

An especially relevant question is the origin of the wine used in Etruria. For a long time, wine has been considered an exotic import brought by the Greeks and/or the Phoenicians along with the dedicated set of vessels and the related consumption rituals. However, recent studies have demonstrated that in central Tyrrhenian Italy, a type of wine was already known before the importation of Greek and Oriental wines.⁶⁸⁸ The specific set of vessels for the consumption of local wine—a cup with a tall vertical handle, and a type of amphora—has been recognized as well. Despite the introduction of new types of wine and associated grapes, agricultural techniques and vessels from the eastern Mediterranean, the local shapes and varieties of wine did not fall into disuse. The study of Latin literary texts allows a level of investigation that is not possible for Etruria and gives an important point of comparison. In Rome, the local wine, called *temetum*, had a ritual function, and its consumption was limited and strictly regulated. Its sphere was very different from that of the

Greek and Near Eastern wines, which were spiced, sweetened, and mixed with water, and were destined for communal consumption and designated by a Latin word borrowed from Greek, *vinum*, which was also used by the Etruscans. For this reason the set of Greek vessels for wine did not replace the local ones in Etruscan burials until the end of the Archaic period. Unlike wine for ritual purposes, the wine for banquets was of Greek and Near Eastern type, either imported or imitated. The shape of the Etruscan wine amphorae of the Archaic period, modeled on Phoenician jars, is evidence for the importance of the Near Eastern component in the development of Etruscan wine production (Fig. 14.1).

The type of banquet which was adopted in central Tyrrhenian Italy in the Orientalizing period had strong hierarchical overtones, but integration and relative equality among the participants developed more strongly than strict exclusivity and elitism. Very soon, social groups of good (but not “regal”) standing shared this practice, as is shown by the quick diffusion of the sets of banquet vessels in Etruria and Latium. As a result, the banquet became one of the most important venues for the representation and reproduction of the power of Orientalizing and Archaic aristocracies and the complex dynamics of social relationship of these periods, both vertically, between the highest ranks of the clan and their dependants, and horizontally, between different clans of the same or other communities.⁶⁸⁹ In fact, the banquet was the common space for the relationships between homogenous social levels of ancient Italy—Etruscan, Latin, Italic, and Greek. It has been rightly stressed that Greek, Etruscan and Latin banquets cannot be considered identical and there are important differences which cannot be overlooked.⁶⁹⁰ Nonetheless, these were not insuperable barriers. The relationship of hospitality, which crossed ethnic and cultural boundaries, was established primarily through participation in a common banquet, and the many cases of aristocratic mobility imply the capacity of a foreign aristocrat to adapt to the banquet ceremonial of his new home, since it was primarily there that he was required to interact with the other members of his class.⁶⁹¹

Fig. 14.1: Etruscan wine amphora from Miletus (photo A. Naso)

The model of Greek conviviality soon prevailed and the Etruscan banquet, like the Greek, became the main venue for cultural communication and production through the instrument of myth. Many of the earliest representations of Greek myth in Etruria appear on wine vessels, and the Etruscan elite were avid purchasers of Greek vases with mythical scenes depicting the core values of aristocratic culture. It was not by chance that many of the most spectacular figured Corinthian and Attic vases were exported to Etruria, and that at least 40 percent of all exported Corinthian craters were found at Caere, including the crater of Eurytios, with a mythical scene that illustrates the role of symposium in relation to hospitality.⁶⁹²

Fig. 14.2: White-on-Red pithos with Ulysses blinding Polyphemos (from Menichetti 2002, 91 fig. 16)

The adherence of the Etruscans to the most typical aspects of Greek wine culture is also shown by the popularity of subjects dealing with the correct use of wine, symposium ethics, and hospitality, in particular the episode of Ulysses and the Cyclops (Fig. 14.2). Moreover, inscriptions on wine vessels celebrating individuals recall a custom of the Greek symposium.⁶⁹³ The Etruscan banquet, however, cannot be considered in quite the same light as a Greek symposium, an institution with very specific characteristics which developed over time and had significant variants in Greece itself.

3The archaic period

In the sixth century, banquet representations become more similar to Greek symposium scenes.⁶⁹⁴ The frieze of Murlo (580–70 BCE) (Fig. 14.3) represents pairs of reclining banqueters on couches, a cauldron on a stand, and servers with wine jugs. The couples comprise a man and a woman and an older bearded man and a younger one who plays a string instrument. The banqueting couples drink from different cups, hemispheric for the mature men and two-handled for the woman and the younger man. Tables with food are set before the couches. The scene looks very similar to contemporary Greek vase paintings. In the later series of friezes known as Rome-Veii-Velletri (ca. 550–525 BCE), the couple on the couch is a man and a woman, with a server, a player of *auloi* and two young men. In the frieze from Acquarossa (ca. 550–525 BCE) there are three men on each couch, a server who pours from a cauldron, and musicians (Fig. 14.4). As in the Rome-Veii-Velletri series, tables with trays and cups are set before the couches. One of the three banqueters holds a long knife, an unusual practice typical of figures—especially Hercules—who do not belong to the symposium. It may be a way of equating one of the banqueters to the hero, probably relating to the other scenes of the series, where the labours of Hercules are represented as the model for the deeds of a triumphant chieftain. A scene of *komos* appears on

the frieze as well, which makes this series of images especially close to Greek models.

Reclining banquets with specific features appear in the tomb paintings from Tarquinia (ca. 530 BCE). In some, a husband and wife affectionately lie on the same couch, and in the others, the wife sits on a throne beside the couch. These representations find close comparisons in terracotta friezes of Eastern Greece (Larisa on the Hermos), and probably represent the banquet in the afterlife. Banqueting couples are also represented in late archaic terracotta urns of Caere (Fig. 14.5) and stone reliefs of Chiusi, while in the reliefs of Fiesole only the man reclines while the woman, when present, may sit on a throne beside him.

Fig. 14.3: Terracotta frieze of Murlo, banquet scene (from Menichetti 2002, 85 fig. 9)

Fig. 14.4: Terracotta frieze of Acquarossa, banquet scene (from Menichetti 2002, 88 fig. 11)

Etruscan women of free status were allowed to take part in banquets and drink wine, a custom that shocked Greek authors of the Late Classical period (Arist. fr. 607 Rose in Ath. 1.23d; Theopomp. in Ath. 12.517d). Inscriptions on vases confirm the role of women as custodians and dispensers of wine.⁶⁹⁵ This custom originates from the strongly aristocratic fabric of Etruscan

society, which gave elite women not only status but also significant freedom of action.⁶⁹⁶ This is a feature not unique to Etruscan society, but it appeared so to the Greeks of the fourth century BCE, when the culture of the archaic aristocracies of eastern Greece—from many points of view similar to those of Etruscan aristocracies—had disappeared and only in a very few specific Greek cities did remnants of that lifestyle still survive.⁶⁹⁷ In these wall paintings, wine consumption is emphasized and the set of wine vessels are depicted in detail, especially the krater, which may summarize the whole wine-drinking ritual or allude to the funerary urn. *Komos* is frequently represented as a link between the human world and the afterlife where the blessed enjoy their banquet. The Tomb of the Inscriptions at Tarquinia shows a line of *komasts*, all men bearing different family names, who move towards a painted door that alludes to the entrance of the afterlife.⁶⁹⁸ In this case, the banqueting couple is replaced by a Greek-style all-male *hetaireia* (Fig. 6.1). A further step towards stricter resemblance to the Greek representations of symposium is found in tombs where the banqueters are men only.

4The classical and late classical periods

Fifth-century tomb paintings are even closer to Greek and especially Attic models, even though women are still frequently represented reclining on the couches. The increased similarity to the model of Greek symposia should be put in the context of the development of the Etruscan city and the formation of an urban society that was comparable to the Greek, at least partly, in structures and dynamics. The symposium institution of the Greek world was a powerful model for the Etruscan aristocracy of the Archaic period, and later for the fifth century selected elite, who were still very committed to this originally aristocratic practice, and used scenes of banquet/symposium as standard model of self-representations until the early fourth century. The continuing presence of women is further confirmation of the still very aristocratic nature of Etruscan society after the establishment of republican state institutions in the fifth century.

In the fourth century, the paintings of some elite tombs of Tarquinia and Orvieto/Volsinii again show food on the tables, while wine vessels seem to lose their prominence. Particularly in Tomb Golini I of Volsinii, a number of cooks and butchers are represented processing and serving food to the masters on their couches (Fig. 14.6). The emphatic representation of the ancient model of banqueting with ample consumption of food may be put in the context of the dialectic between the higher aristocracy and the new classes that obtained social and political recognition in the second half of the fourth century. It is probably not by chance that these scenes—powerful images of hierarchy, abundance, and effective administration of economic and human resources—appear in the countryside of Volsinii, where local aristocrats retired from the city before the political and social crisis that caused the Roman intervention, and in Tarquinia, the watchdog of aristocratic order in Etruria. The general crisis of the symposium institution in the Greek world itself should be also considered, which developed alongside the crisis of the classical polis.

5The Hellenistic period

In the Hellenistic period, the banqueter reclining on a couch is the standard image of the deceased, both male and female, represented on the lids of sarcophagi and urns. These figures frequently hold *phialai* or *kantharoi*, the cups of heroes and gods, rather than symposium cups, and Dionysiac symbols are not uncommon. The tomb chamber appears as a representation of the banquet in the afterlife, where the dead enjoy their new status as heroized ancestors, some upright and some lying down and falling asleep, ready for their rebirth.

6Archaeological evidence for Etruscan diet

In spite of its exceptional cultural and symbolic importance, the banquet and its display of abundance is neither representative of the elite Etruscan diet nor of that of less privileged groups. Ancient literature and figurative art did not pay much attention to everyday meals, and modern research on this matter is still in the initial stages.⁶⁹⁹ However, the analysis of vegetal and animal remains found in archaeological context is supplying long-awaited evidence. Data from sanctuaries are useful but cannot be considered representative, since they depend on the specific regime of offerings of the various cults, which were often far from regular dietary habits.⁷⁰⁰ Food remains in burials are also important, but those were probably special meals, both in quality and quantity. Settlement contexts are a more reliable source of evidence for a more balanced reconstruction of the Etruscan diet.⁷⁰¹

The general picture which can be outlined after the analysis of faunal and plant remains from different sites and contexts is relatively consistent.⁷⁰² Hunting, chiefly of deer and wild boar, along with small game such as hare and birds, made a minor contribution to diet, especially in cities, where it is almost absent. Meat was supplied by cattle, sheep and goats, and pigs. Cattle were usually slaughtered in old age, after they had long been used for work, milk and manure. Pig farming grew more popular starting from the Early Iron Age, and became especially important in the third century. A shift towards pig husbandry is a general trend observed in all Etruria. Pigs, which were very prolific and had low production costs, were a convenient source of meat for a rapidly increasing population, especially in the cities. Since the majority of sheep and goats were slaughtered when they were at least three years old, they must have been raised for wool and meat, while the production of milk was less important because a large amount of it had to be used to feed a large number of lambs. Poultry is attested from the Early Iron Age and is common in the Archaic and Classical periods. Fish is a less common find, or rather a find that has attracted little scholarly attention, but remains of fish have been found in settlements, sanctuaries and tombs. In the tombs of Verucchio, there were both freshwater and saltwater fish, sea urchins and seashells.⁷⁰³

Pollen and seeds found in tombs and settlements confirm the importance of cereals (wheat, barley, spelt, rye, panic, and millet), as is also stressed by ancient literary sources on the abundant grain production of Etruria. Legumes (broad beans, lentils, chickling vetch, and peas) are fairly common as well. These crops are especially suited for rotation with cereals.⁷⁰⁴ A whole squash with seeds was found in a tomb of Verucchio. Fruit complemented the diet and is well attested in archaeological contexts. Hazelnuts are a common find especially in Villanovan tombs, along with grapes and apples.⁷⁰⁵ There is also evidence for figs, pomegranates, elderberrys, and other fruits and berries. A honeycomb was offered in a tomb of Casalmarittimo.⁷⁰⁶ Olive oil was probably produced very early⁷⁰⁷ and was an important part of the diet, as in most of the Mediterranean region.

Archaeological evidence is important for the identification of the

components of Etruscan diet, but it is difficult to get a clear idea of quantity and frequency of consumption. Great help comes from the chemical analysis of bones and the study of dental wear, which clearly show that the diet of the Etruscans was largely based on agricultural produce. Meat consumption was uncommon, probably occurring only on the occasion of religious festivals and public and private ceremonies.⁷⁰⁸ The study of a sample of the population of Hellenistic Tarquinia, middle-class individuals who could afford small chamber tombs, shows that their diet was chiefly vegetarian, with large use of starchy food, and meat a rare commodity.⁷⁰⁹ However, we can assume that the diet of the elites was richer in animal proteins. A partial confirmation is given by the animal remains of the House of the Impluvium at Roselle, the home of a well-to-do sixth century family.⁷¹⁰ Here, contrary to the general trend, the majority of cattle bones are from young animals. The owners of the house were able to afford high-quality meat, which was most likely consumed at the banquet, that powerful indicator of status. The literary stereotypes of the “fat Etruscan” and of the decadent banquets of the Etruscans found in Greek and Latin sources⁷¹¹ were clearly developed on the basis of the banquets of the elite. In the context of the Roman debate on private luxury, they could be used as an example of a once powerful people allegedly destroyed by hedonism and moral corruption.

15Sports

Abstract: One aspect of Etruscan civilization for which we have a considerable number of sources—textual, epigraphic, and especially iconographic—is sports. Images of games appear in Etruria since at least the seventh century BCE. Contrary to what is often stated concerning a supposed closely-followed Hellenic model, the Etruscans exhibited in this area in particular considerable originality with respect to Greece, the most striking example being the social status of Etruscan athletes, who were “dependents,” “*servi*,” and not full “citizens.” The Etruscans’ favorite events were pugilism and horseracing, including the *triga* races that were unknown to the Greeks: the techniques of the Etruscan drivers were later adopted by the Roman charioteers. While funeral games are the best known, thanks to the frescoes from Tarquinia and the Archaic reliefs from Chiusi, the Etruscans also organized public and sacred games and games inside their cities (such as at Cerveteri), and we must not forget the *ludi* that took place in their sanctuary of the *Fanum Voltumnae*.

Keywords: horseracing, boxing, athletes, pentathlon, games

Introduction

One aspect of Etruscan civilization for which we have a considerable number of sources—textual, epigraphic, and especially iconographic—is sports. Images of games appear in Etruria since at least the seventh century BCE, confirming a telling passage in Livy (1.35) on the reign of Tarquinius the Elder. Contrary to what is often stated concerning a supposed closely-followed Hellenic model, the Etruscans exhibited in this area in particular considerable originality with respect to Greece, the most striking example being the social status of Etruscan athletes, who were “dependents,” “*servi*,” and not full “citizens.” The Etruscans’ favorite events were pugilism and horseracing, including the *triga* races that were unknown to the Greeks: the techniques of the Etruscan drivers were later adopted by the Roman charioteers (the *agitatores*). While funeral games are the best known, thanks to the frescoes from Tarquinia and the Archaic reliefs from Chiusi, the Etruscans also organized public and sacred games and games inside their cities (such as at Cerveteri), and we must not forget the “Pan-Etruscan” *ludi* that took place in their sanctuary of the *Fanum Voltumnae*.

1The sources: A favored theme

Jacques Heurgon's wonderful book on daily life among the Etruscans was published in 1961. And while many fortunate discoveries have been made since that time that have, to some extent, modified our view of the civilization, and many articles have clarified aspects of our understanding, the lines dedicated by the French scholar to Etruscan sports and games remain valid today:

Whatever we are best acquainted with in the manners and customs of the Etruscans comes from their games, because, in the special form of funeral games, they loved to depict these on the walls of their tombs or sculpt them on their *cippi* and sarcophagi.⁷¹²

In fact, we must stress at the outset the variety of sources available to us for addressing this question, and that they are not severely limited, as might be the case for other aspects of Etruscan life.

But first of all, remaining with iconography, in addition to the frescoes from Tarquinia or the Archaic reliefs from Chiusi, we must not forget what can be gleaned from scenes on pottery, beginning with bucchero that is incised or decorated with more sophistication (in both relief and engraving), which takes us far back in time, to the seventh century: the publication of the *olpē* from Caere (Cerveteri) that shows, along with Medea (Metaia) and Daedalus (Taitale), a pair of boxers in action illustrates the Etruscan interest in pugilism already in the 630s.⁷¹³ But black- and red-figure pottery is not excluded: among these items, there stands out a necked amphora by the Micali Painter, from Vulci in the British Museum, from the end of the sixth century, which offers a collection of athletic scenes taking place alongside a *pompa*, the religious interpretation of which is not yet clear.⁷¹⁴ The importance must also be stressed of series like the stelae from Felsina (Bologna) that have been carefully studied with respect to funeral games:⁷¹⁵ this glance toward Po Valley Etruria also carries us closer to the art of the *situlae*, on which the *ludi* constitute a dominant theme clearly marked by Etruscan influences. And if we then turn to the other Etruscan "province," in Campanian Etruria, we cannot ignore the contributions of the Capuan bronze *lebetes* ("cauldrons") (Fig. 74.8), especially the Barone *lebes*, and no less the paintings from Paestum, for there again, the scenes of games have a pronounced Etruscan stamp. Lastly, we must not forget the interest of some athletic scenes incised on mirrors or cists.

The quotation given above might suggest that the literary and epigraphic sources take second place. In fact, they make it possible for us to hone our views on chronological and social questions. It is almost a shock that authors as eminent as Herodotus (1.167) and Livy (1.35.7–10) mention Etruscan games, even if their remarks are of course presented from the Greek or Roman point of view; there are even several authors, including Aristotle, who look into a subject so apparently trivial as the Etruscan practice of fighting to music: but in that case, the frequent interest in the customs of a foreign people is sometimes coupled with the well-known urge to denigrate its softness and

its luxurious lifestyle (its *truphē*).⁷¹⁶ As for inscriptions, while they are limited to a few names painted (or engraved) alongside athletes shown on the frescoes from Tarquinia, they nonetheless reveal the status of such persons, and they guide us to a view of Etruscan athletics that is not the one that is traditionally proposed.

2The earliest athletic scenes

The passage by Herodotus (1.167) mentioned above has often been used to locate the oldest Etruscan games a little after the middle of the sixth century BCE.⁷¹⁷ The historian tells us that the Caerites stoned some of their Phocaeen prisoners after winning the naval engagement that has come to be called the battle of the Sardinian Sea (the battle of Alalia) around 540 BCE. A series of omens ensued, and the Etruscans of Caere “sent to Delphi wishing to set right their offense and did what the Pythia ordered, as they still do today: they sacrifice to the Phocaeans who were stoned to death as to heroes, and held *athletic and equestrian competitions* in their honor.”⁷¹⁸ The presence of many athletic themes in the frescoes from Tarquinia from the last third of the sixth century seems to confirm the Greek historian’s information. This conclusion would be all the more acceptable in that, according to some, the Greek model was imposed throughout Etruria, and still more so in the domain of *agōn*, of athletic contests. In the history of sport, everything supposedly goes back to Greece, and no one could possibly have done anything but imitate the Olympic or Pythian Games.

This, however, is not so: the Etruscans did not have to wait to go to Delphi to discover sports. Livy, in his discussion of the reign of Tarquinius the Elder (1.35.8), notes that to celebrate his victory over the Latins, he organized—in a newly developed Circus Maximus—games more lavish than those of his predecessors. The spectacle (*ludicrum*) included exhibitions of horses (*equi*) and boxers (*pugiles*) “which had mostly been brought from Etruria” (*ex Etruria maxime acciti*). Thus in some Etruscan cities at least, sporting events were known from the end of the seventh century: we might consider the city closest to Rome, Veii, its perpetual rival since the foundation of the *Urbs*. An incised bucchero vase, found in Veii in the nineteenth century, dating from the last third of the seventh century, provides a straightforward illustration of this proposal: on the belly of this olla can in fact be seen a fine depiction of boxing, with two fighters in action, fists raised, wearing singlets.⁷¹⁹

But Veii is not the only relevant Etruscan city: at Caere, as already mentioned, a painted urn has been found, also from the seventh century, showing a boxing match,⁷²⁰ and today we know, from the same period and the same city in the tomb of San Paolo, the aforementioned bucchero *olpē* decorated with mythological scenes of Medea, Daedalus, and perhaps Jason,

flanked by a pair of athletes in a boxing match.⁷²¹ Lastly, and still from the seventh century, a painted olla attributed to the Civitavecchia Painter, who may have worked in the same region of Caere, places us at a boxing match that is for the first time accompanied by an *aulos*-player – henceforth a constant in this civilization.⁷²² The excavations at Murlo (Poggio Civitate), near Siena, in northern Etruria, have yielded for the beginning of the sixth century terra cotta plaques showing a horserace with young jockeys riding bareback (a sort of Palio di Siena race *avant la lettre*!): in this way, Livy’s pairing *equi/pugiles* is confirmed by Etruscan iconography from this early period. Which must not cause us to leave out the bronze statuettes from Murlo showing two wrestlers and the referee, dated to the late seventh century.⁷²³

3The social status of athletes

As shown by the various literary and epigraphic sources available to us, as well as other images that run the gamut of sportsmen, executioners, and clowns, it was not the Greek agonistic model of the Classical period that was applied in Etruria at the same time: this must be emphasized because, as has been recalled in the preceding section, Etruscan sport has often been presented as a carbon copy of the Hellenic *agōn*. In fact, while in the Archaic and Classical periods binomial personal names, with praenomen and gentilic, were the rule for free men, for Etruscan “citizens,” this is not the case for the athletes represented in particular on sixth-century frescoes. So for instance in the Tomba degli Auguri (Tomb of the Augurs) in Tarquinia, which includes training scenes, the fighter on the left is simply designated with the single name Teitu, while his older adversary is called Latithe in another painted inscription (Colour plate 18): the name is universally recognized as an ethnicon calling this athlete a “Latin,” whether or not he really came from Latium, or whether it might be a pseudonym, a *nom de guerre*. In any case, it is clear that these individuals stand outside the class of gentlefolk, that they belong to a lower stratum of the population, as Massimo Pallottino has observed.⁷²⁴ But the very fact that they were given any name at all on these paintings is not irrelevant: these were real sports stars, and the deceased (or his family) wanted these individuals—perhaps he was a fan of theirs—to accompany him in image to the beyond. For his tomb, Trimalchio had the same expectation of his favorite gladiator, Petraitēs, whose name was to be displayed on many artifacts (lamps, glasses, etc.; Petron. *Sat.* 71.6).

Other inscriptions painted alongside muscle-bound athletes, such as on frescoes in the Tomba delle Iscrizioni (Tomb of Inscriptions), again at Tarquinia, confirm this impression, since there too they receive single names, so that they are outsiders to the gentle class. As for the incised graffiti discovered by Massimo Morandi beside the fighters in the Cardarelli Tomb at

Tarquiniā, they refer to gentlefolk (*velchasnas, petui*), but they are in fact the names of the *domini* of these athletes, of the owners (including at least one woman) of these “stars” of the Tuscan ring.⁷²⁵ The fact of the desire to individualize the competitors is the proof that these were real athletes who really fought, perhaps during the funeral games, or more likely previously, in real competitions: metaphorical or symbolic analyses do not take into account this fact.⁷²⁶

The literary sources tell the same story of the inferior social status of these athletes. At the beginning of Livy’s book 5, where he describes the Etruscans as the most religious of men, he mentions a king of Veii who was hated by all for his impiety: indeed, in his disappointment at not being elected high priest of the Twelve Peoples of Etruria, he withdrew the performers, “most of whom were his own slaves,” from the games, committing a grave impiety. The Latin word *artifices* refers to both “circus” and theatrical performers, and it is easy to see the status of these Etruscan athletes at the end of the fifth century: “slaves” or in any case dependents. The status of the Etruscan charioteers was surely no different, since even in Greece they were also just technicians and might be of low birth, the real participant being the owner of the chariot and horses: it was no doubt from the stables, among the stable boys, that these charioteers were chosen, in the cities of Etruria just as in those of Greece and Magna Graecia. The Etruscan charioteer Ratumenna, who, according to a legend attached to the terra cotta *quadriga* from the Capitoline Temple of Jupiter, was of noble birth and gave his name to a gate of Rome, is not at all representative of the status of Tuscan charioteers. No more than in Greece, where there were lists of winners—Olympians—did this prevent the names of Etruscan champions from being inscribed on tablets and preserved, as can be seen on two Archaic reliefs from Chiusi.⁷²⁷

4Athletic contests; Combat sports

Boxing was always the favorite sport of the Etruscans—alongside chariot racing—as well as of the Romans. The preeminence of boxing is confirmed by the number of representations in the sixth and fifth centuries, especially on the frescoes from Tarquiniā, where boxers are sometimes the only athletes shown, and where they often occupy a choice spot, for example framing the entrance gate like two guards poised to threaten any unwanted visitors (Cardarelli Tomb).⁷²⁸ A popularity that can also be seen on the funerary stelae from Felsina: boxing is at first the only sport represented—sometimes alongside the *biga* (two-horse chariot) race—and we recall the sports program detailed by Livy in connection with Tarquinius the Elder. But this sport also occupies a privileged position in the decoration, with several individuals (the two fighters, the trainer with the sponge, the musician, and the referee), as can

be seen on the stela P. Ducati no. 169 and also on the black-figure amphora of the Micali Painter in the British Museum (B 64).⁷²⁹ The *tibicen*, the *subulo* (Etr. *suplu*, “*aulos*-player”), is almost always found alongside Etruscan boxers.⁷³⁰ Several ancient authors note this custom, some of them choosing to see it as a sign of the Etruscan “*truphē*”: a baseless charge, since, as is easily seen in Thai kickboxing, which has nothing soft about it, the musicians are there to provide a rhythm for the blows of the two combatants and even to stir up their zeal for the fight.

It is revealing for the Etruscan taste for the “sweet science” that it has been possible to identify, on an Archaic relief from Chiusi, a ballet of boxing, with three athletes boxing and dancing rhythmically, under the direction of an *aulos*-player.⁷³¹ It reminds us of Jean Cocteau’s observation that boxers are “dancers who kill.” Before the discovery of a recently published Classical boxing scene on a relief from Chiusi, a major infatuation with wrestling had been observed in this city especially:⁷³² on the reliefs as well as the frescoes from Chiusi, we witness a very spectacular hold in which one of the wrestlers veritably takes to the air over the other: this athletic move, which would mark the end of a round of the match—if the Etruscans followed the Greek rule of three falls—in any case appears to be a hallmark of the Chiusi craftsmen. But other Etruscan cities were not unfamiliar with this event, as the Tomb of the Augurs in Tarquinia and the black-figure *dinos* in Arezzo—which in fact came from Saturnia—bear witness.⁷³³

5 Other athletic contests

Did the Etruscans have a pentathlon? On the two main walls of the painted Tomba delle Olimpiadi (Tomb of the Olympiads) at Tarquinia, dating to the 530s, in one area there appear a *biga* race and a boxing match, and in another a collection of three contests, with a foot race, a long jumper, and a discus thrower. The Tomb of the Augurs (Colour plate 19) also shows the typically Etruscan game of Phersu: a hooded man armed with a mace is attacked by a vicious dog goaded by a masked executioner. The latter bears the name Phersu, or “Mask” (a word corresponding to Latin *persona*). This has mistakenly been taken to represent a foreshadowing of Roman gladiatorial combat, which, in fact, seems to have its actual origin not in Etruria but in Campania, as is clearly shown in funerary paintings from Paestum.⁷³⁴ The combination of three athletic contests mentioned above might lead one to suppose that the Etruscans also knew the Greek pentathlon, which included wrestling and javelin: an impression confirmed by the aforementioned amphora B 64 of the Micali Painter, where a javelin thrower and a discus thrower are shown side by side, and especially by an Archaic relief from Chiusi, now in Palermo, on which one athlete, depicted receiving his reward,

holds both a discus and a javelin. But the absence of literary texts and inscriptions leaves many questions open. The runners from the Tomb of the Olympiads are sprinting: but is it a *stadion* (ca. 200 meter) race? Did the Etruscans have events similar to the *dolichos* (a little less than 5,000 meters) or the *diaulos* (a double *stadion*)? The depictions show that the Etruscan long jumper ordinarily used dumbbells to improve his performance, and that the javelin thrower propelled his equipment with a strap called an *amentum* in Latin (a very fine depiction of which can be seen in the frescoes from the Tomba della Scimmia, i.e. Tomb of the Monkey at Chiusi). In view of the clumsiness with which Etruscan artists portray the stance of the discus thrower, this event was perhaps not very popular in Etruria. Certainly, beginning in the 450s, and especially in Po Valley Etruria, many are the bronzes—ex-voto or decorations on candelabra, for example—representing a pentathlete. At Bologna there is even an athlete who cannot be anything but a shot-putter: did this competition exist in Etruria?

As for Etruscan originality, the question of nudity is also an essential criterion, since the Greeks themselves claimed athletic nudism as a trait that distinguished them from the barbarians. While fully naked Etruscan athletes are sometimes encountered, such as the wrestlers of the Tomb of the Augurs in Tarquinia, the realism of Etruscan art, in any case in the late sixth and early fifth centuries, grants us a better understanding of some practices that the idealization of contemporary Attic art has almost entirely concealed. Thus some Etruscan athletes are provided with an athletic belt, more specifically a leash: the penis is cinched up with a short cord attached to a belt.⁷³⁵ The frescoes of the Tomb of the Monkey at Chiusi offer very clear examples of this practice. Truth to tell, in real life it was not much different for the Greeks: a few—very few—vase paintings, including a beautiful crater of Euphronios, provide confirmation. The vast majority of Greek athletes had to wear an athletic supporter. This is not to deny that, from the point of view of decency, they were naked. In this respect, the Etruscans were not really barbarians; but the Etruscan artists were not satisfied with copying Greek images: they really did represent local reality.⁷³⁶

6Equestrian events

It is in this area that Etruria exhibits the most striking originality in sports: from the beginning (seventh–sixth centuries) the success of horseracing can be observed, foreshadowing the situation and popularity of the *ludi circenses* of Rome. Once more it is the funerary frescoes from Tarquinia and Chiusi that provide the most striking attestations. The name “Tomb of the Olympiads” coupled with the 1960 Rome Olympics contributed inopportunely to this impression of widespread Hellenization of Etruria. On the left-hand wall of

this little hypogeum, alongside the boxers, four *bigae* hurtle toward the finish mark, a simple red post: the lead charioteer looks back to check on the position of his competitors, and the fourth one falls victim to a wreck, a spectacular upset. The apparel of these charioteers is significant: they all wear a short tunic to the mid-thigh, and some have a leather helmet. This dress has nothing in common with that of the Greek charioteers, such as the Charioteer of Delphi, who have a long tunic that falls to their feet and are normally bareheaded. Moreover, their techniques prompt the same observation: the Etruscan charioteers tie the reins around their waist in order not to drop them, while the Greek charioteers simply hold the reins in their hands. When we add that the Etruscan charioteers wield a whip while their Greek counterparts use a long horse-goad, the *kentron*, it is clear that there was a great gulf between the horse cultures of the two peoples.⁷³⁷ On the other hand, when it comes to the equipment and technology of chariotry, the Romans learned almost everything from the Etruscans, and very little from the Greeks: thousands of documents big and small, mosaics, bas-reliefs, terra cottas, glass items, intaglios, confirm this assertion.⁷³⁸

The types of chariot used in these contests are further evidence. The Etruscans never raced the *quadriga* that is the royal chariot in Greece, where the *quadriga* triumph was reserved to the social and political elite. In contrast, the Etruscans preferred the *biga* and even the *triga*, the chariot harnessed to three horses, with two yoke-horses and an outrunner trace-horse: thus on the Archaic reliefs from Chiusi, almost half the harness races are *triga* races.⁷³⁹ The Greeks never held *triga* races, contrary to the Romans, as we learn from Dionysius of Halicarnassus and from several inscriptions recording the achievements of celebrity charioteers. In Rome, on the Campus Martius, along the Tiber, there was a training ground called the *Trigarium* because of the *trigae* that appeared there: the site with that name goes back to the “Etruscan” period of Rome, under the Tarquins.⁷⁴⁰ The most recent argument in this dispute concerns Etruscan and Roman interest in horse-acrobats (Lat. *desultores*), who leapt down from their mount at some point in the race, or who jumped from one horse to another, whereas neither Etruscans nor Romans ever knew plain races with traditional jockeys (after the example of Murlo, no such depiction is found in Etruria).⁷⁴¹ This is another point of contact between Etruscan and Roman sports, and another difference from Hellenic practice.

7 Religious aspects

Some favor symbolic interpretations, but it is clear that the paintings in the hypogea are a remembrance of organized games in connection with the funeral of the occupant of the tomb: the Etruscans used a ritual like that

already described by Homer around the funeral of Patroclus in book 23 of the *Iliad*. It is a stage in the rite of passage that also includes the preparation and conveying of the body, not to mention the banquet and the dances that are associated with sports in several documents: but the order of these rites is difficult to establish.⁷⁴² These ceremonies do not concern only the deceased: the clan and sometimes the neighbors or the residents of the entire city are tasked with this mourning that must be extravagant (Tarquinia, Tomb of the *Bigae*). Athletic competitions, dances, and banquets allow the living to overcome this ordeal and recover their strength for the future of the social group.⁷⁴³ The paintings, which perpetuate the ritual efficacy of the games, bring consolation to the dead man, who lives a life of idleness in the beyond. Observing the violent character and bloodshed of Etruscan sport—for example in the boxing scenes (Tarquinia, Tomb of the Olympiads, Tomba del Letto Funebre, i.e. Tomb of the Funerary Couch)—some believe that it provided extra life to the deceased.⁷⁴⁴ Although a chariot wreck might prove fatal for the charioteer, such episodes are quite realistic details from the world of sport.

While the presence of sports stars in the funerary frescoes from Tarquinia favors a realistic rather than a metaphorical reading, it also illuminates the splendor of these ceremonies, the expense involved, and so the social status of the families in question. It is a matter of pointing up the rank of the deceased and his *gens* as the frescoes did: in the necropolis of Monterozzi, only two to three percent of the tombs are painted. Such an investment was not available to every family, and this is all the more true of the games that are such a frequent theme on the painted walls. Archaeology and iconography deliver revealing elements. Beginning in the seventh century, several Orientalizing tombs at Tarquinia (the tumuli of Doganaccia, Poggio del Forno, Poggio Gallinaro, and Infernaccio) exhibit a “theatrical” structure: a very wide *dromos* [entranceway], resembling a small public square, often ringed on several sides with benches to accommodate spectators, primarily from the clan, who in this way would be able to watch dance performances as well as boxing or wrestling matches, within the context of funerary games. Other religious ceremonies, such as sacrifices, could of course be performed there as well. In the sixth century, a tomb like the Cuccumella in Vulci, or a rock-cut complex like the Grotta Porcina, near Blera, with an altar or cippus base, still had structures of the same type.⁷⁴⁵ Here the viewing public was doubtless limited to the *gens*, but this is no longer so in the following case.

The Tomb of the *Bigae* in Tarquinia (ca. 500 BCE) exhibits a rare theme on its painted walls: wooden galleries sheltered by *vela* and filled with a large, varied audience, men and women, and even, lying beneath the galleries, young slaves engaged in erotic play. This image seems to illustrate the description of the Circus Maximus in the time of the *Etruscan* king Tarquinius the Elder, such as is given by Livy and even Dionysius of Halicarnassus. The number of spectators who are present at the horseraces and athletic contests

reveals that we are not in the presence of just one family: we are well beyond the single sphere of the private, and it is not utterly out of the question to suppose that the deceased nobleman was a magistrate of Tarquinia, and that his descendants organized funerary games to which were invited at least some of his “constituents.” In any case, it was very much the social position of the dead man and his family that was celebrated one last time.⁷⁴⁶ Moreover, the presence of women, who appear sometimes to occupy the place of honor in a gallery, reveals their status in Etruscan society: such position, unknown in Greece, recalls instead the Circus Maximus in Rome, which, according to Ovid (*Am.* 3.2; *Ars am.* 1.135–62), similarly offered fine opportunities for the roués of the *Urbs*.

Besides the funeral games, private or semi-private, organized within the circles of the great families of the Etruscan aristocracy, there were also public and sacred games offered to various gods: the organization of games to appease them, as in the event of an epidemic—the conception of *ludi* as a ritual of proxy—itself seems to be an Italic tradition, originally Etruscan and then widely diffused to Rome. Thus it was in fact the city of Caere that organized equestrian and athletic games after the battle of Alalia. And most of the major Etruscan cities must likewise have held games, for instance to honor their patron god, on the model of the Roman *Ludi Magni* celebrated in September in honor of Capitoline Jupiter. But the exact identification of the gods or goddesses to whom the Etruscan *ludi* would have been dedicated remains rather uncertain and often reflects the Greco-centrism that is so prevalent in this area.

The best attested games are in fact those that took place not at the city level but on the federal scale: the only way the Etruscan dodecapolis expressed its unity each year was in these religious displays and spectacles that must also have accompanied lively fairs, central markets. These pan-Etruscan athletic and theatrical entertainments were dedicated to Tin(ia), the principal god (*princeps*) of the Tuscan pantheon, celebrated here under the surname Voltumna, which must have referred specifically to his role as protector of the League of the Twelve Peoples. The *Fanum Voltumnae*, mentioned five times by Livy, was doubtless located at the foot of Volsinii (Orvieto), in the area known as Campo della Fiera, where promising excavations are under way: perhaps they will be lucky enough to uncover lists of victorious athletes or charioteers, since two reliefs from Chiusi dating to the fifth century show scribes recording on tablets the names of the winners of sporting events held in Etruria.

16Dance

Abstract: Dance is one of the oldest and most widespread forms of communication, a universal, unspoken language. It is a language of artistic expression that is simpler, but also more powerful and more involving; in it man neither shapes nor uses materials, but himself becomes the message, the energy, the measure, the material, and the form. It is easy to understand how, in its expressive immediacy, dance becomes part of the heritage of values that characterizes a human society, and so it becomes a means of expression in individual, collective, private, public, and religious contexts.

In order to interpret a dance, especially in the ancient world, we cannot ignore the sociocultural context in which it was performed, because dance is not fashion, but message. For Etruria, however, we do not have such a plethora of sources as we do for the Greco-Roman world. To reconstruct Etruria, we have almost nothing but iconographic sources and archaeological discoveries. Our understanding of Etruscan dance is thus inevitably spotty, and based solely on images. From what we can see, we do not know the names or types of movement, the rhythms, the music, or the song. We do not know whether spectators were present, because already in antiquity there was private dance, done for individual enjoyment—or in desperation, like a public ritual dance, performed as a response to or to make visible the needs of class, caste, or community.

Keywords: round dance, serpentine dance, orgiastic dance

Introduction

It might be trivial to point this out, but our modern conception of dance—with respect to its forms, features, and situations—is a long way from what dance has meant for millennia in human society, and what it continues to mean in pre-industrial cultures. Three examples to better portray what has been lost follow. At Lepanto in 1571, on the verge of the battle that would decide the fate of Europe, the son of Charles V, John of Austria, commanding one of the greatest fleets of all time, danced a galliard on the upper deck of his flagship, a few meters from the Ottoman ship that was poised for the encounter.⁷⁴⁷ In the heart of the Middle Ages, in the greatest cathedrals of France—Auxerre, Sens, Amiens, Chartres—the bishop led the clergy in a solemn dance, which wound over a labyrinthine choreography inlaid in the pavement of the nave.⁷⁴⁸ At the threshold of history, dances accompanied the entry of the Ark of the Covenant into Jerusalem, led by King David, in a garment that was far from a royal robe.⁷⁴⁹

Dance is one of the oldest and most widespread forms of communication, a universal, unspoken language. It is a language of artistic expression that is

simpler, but also more powerful and more involving; in it man neither shapes nor uses materials, but himself becomes the message, the energy, the measure, the material, and the form. It is easy to understand how, in its expressive immediacy, dance becomes part of the heritage of values that characterizes a human society, and so it becomes a means of expression in individual, collective, private, public, and religious contexts.

It is clear, therefore, that in order to interpret a dance, especially in the ancient world, we cannot ignore the sociocultural context in which it was performed, because dance is not fashion, but message. For Etruria, however, we do not have such a plethora of sources as we do for the Greco-Roman world. To reconstruct Etruria, we have almost nothing but iconographic sources and archaeological discoveries. Our understanding of Etruscan dance is thus inevitably spotty, and based solely on images. From what we can see, we do not know the names or types of movement, the rhythms, the music, or the song. We do not know whether spectators were present, because already in antiquity there was private dance, done for individual enjoyment—or in desperation, like a public ritual dance, performed as a response to or to make visible the needs of class, caste, or community.

1Iron Age

We are not able to positively identify dance in the images of people that appear on objects from the Early Iron Age. This is the case of the hut-urn from Tomb Selciatello 45 in Tarquinia.⁷⁵⁰ The figures on its sides may represent actual images that were painted on the exterior walls of an actual Villanovan hut. In a world like that of the ancients, where drawing a picture meant to evoke something, we can eliminate the possibility that such paintings were purely decorative. We do not know the message that was to be transmitted, but we do know that there was one: may ancestors or gods protect the inhabitants from whoever might come from outside? Are the paired figures holding hands? Are they still, or do they move around the hut? These questions are fated to remain unanswered.

2Orientalizing period

In the second half of the eighth century, Bisenzio provides the first sure depictions of dance. The Olmo Bello 22 tomb has yielded a bronze situla on whose shoulder and lid are two processions of warriors, all the way around, bearing a small shield and a mace or a spear⁷⁵¹ (Fig. 16.1). In line, unambiguously facing right, they appear to move in martial lockstep. The legs spread to express stability, the arms stretched wide to increase the majesty of

the figure following a technique well known from ethnology, and still found in war dances (such as the Maori *haka*). The unison gait, the pose, and the display of arms mark the potency of the group, which is underlined by the fact that the figures are ithyphallic. The exhibition of the male organ is frequent in small figurines, but here, this detail is emphasized in a display of virility and of scorn for the enemy that is very appropriate in an armed dance, widely paralleled in other primitive warrior cultures, from the Highlanders to the Zulu. A round dance is portrayed on the lid; the men are equidistant and orbit an animal trophy (or totem) in the form of a bear, bound with a chain (which, in this case, secures the lid to the situla). It may represent a propitiatory rite for a hunt or for battle (given that in this period war is an extension of the hunt), or a dance to celebrate a successful outcome, perhaps the capture of the bear itself, the warrior animal par excellence, a wild counterpart of man, which like him fights on foot and bares his breast to the enemy. In fact this is the scene that confirms the presence in this phase of Etruscan civilization of the sort of totem animal that is well attested for other populations of ancient Italy, the most famous example being the She-Wolf of Rome. The round dance provides still more information about the society that gave expression to it; it is a dance of equals, there is no first or last in line, and no first or second rank. And these “equals” are equal among themselves, but are distinct from those that surround them; again it is the circle that declares this distinction, and it is the display of arms, the coordinated synergy, the knowledge of the steps and movements, the very acceptance of the individual in the group of other dancers / hunters / warriors that sanctions it. “I know how to dance to Ares’ tune in the grim killing zone” is what Homer has Hector say, a few decades earlier.⁷⁵² Dance introduced these progresses of chorality and distinctiveness that we will find confirmed later on.

Fig. 16.1: Bisenzio, necropolis of Olmo Bello, Tomb 22. Bronze situla (detail). Rome, Villa Giulia (photo SAR-Laz)

More complicated is the interpretation of the scene on the shoulder of the situla. The dancers and their solemn advance are those of the lid, as are the

direction and the stance; they could be forming a larger circle. But they also could be taking part in a different dance, a procession, because here there is an interruption—a man who seems to be leading an ox, and another person raised above the others, who, armed with a spear and facing left, seems about to fell the ox itself. What sort of dance or ritual is taking place? It is difficult to interpret the depiction otherwise; the ox, as much as the bear, is a symbol of power. The sacrifice of one could well be part of a military dance. One last question: is it the dance of a people, of youths qualified by age for military service, or the dance of a caste, of however many are qualified for military service by belonging to a social class? We do not have what would be needed for a response. In that period in Etruria, however, society was becoming complex and vertical. There appear rich funerary accoutrements, and the conduct of war and of the collective social duty, become the prerogative of the ruling class. It is probably more of a status symbol, since this situla inspired by arms was deposited not in a man's rich tomb, but a woman's. It is significant to observe how, at Bisenzio, the three groups of grave goods that in this period include objects decorated with "narrative" scenes are all for women, as if the woman was the custodian of symbols and memories. This is the case for our situla, for the wheeled bronze incense-burner of Tomb Olmo Bello 2 (Fig. 10.1),⁷⁵³ and for the olla from Tomb 2 of Bucacce.⁷⁵⁴ The latter, dated to the end of the eighth century, bears forty-eight female figures holding hands, divided into sixteen groups of three, in red or black. A similar round dance is suggested a little later on the amphora from the necropolis of Pianetto di Ischia di Castro, with five female figures (Ischia di Castro, Bocci Coll.). We cannot say very much about these groups, other than comment on the number engaged in the round dance, or at least in dances in which they move as one. There seems to be a collegial solidarity of those who dance, and an "exclusion" of the outer world.

So far we have encountered unisex choral dances, that happen in an unambiguous direction. In the first quarter of the seventh century, a more complex dance is found on the *oinochoe* of the Pittore dei cavalli allungati (Painter of the Stretched Horses), in the British Museum (Fig. 16.2).⁷⁵⁵ Three men, identifiable by their brief garments, alternate with two richly dressed women. All have their arms open and raised, and appear to be moving forward and in line, but while the women are immobile, or in orderly movement, the men are performing the steps of a leaping dance, with the two at the sides holding a pole (probably a spear) pointed at the ground on the outer side of the line, as if to provide symmetry and borders. One of the female figures displays a crown or a tambourine. We might see in it the *geranos*—the serpentine dance—like that with which Theseus and Ariadne celebrated the liberation of the Athenian youths from the Minotaur. It is impossible to be certain, just as it is impossible to say whether the scene recalls a myth, represents an actual dance, or a ritual that recalls a myth. What is certain is that this scene was present in the imaginations of the amphora's

painter and owner, and whereas the first dances we looked at were unisex and choral—done to reinforce the bonds of a group—here we have both sexes, distinguishable by their garb, movements, poses, and props. The woman is portrayed with measured presence; the man with an exuberance emphasized by nimble legs, and marked by the spear. Two contrasted worlds meet in what the dance is meant to express: the harmony of their union, of their coming together. It is a message that continues to live in contemporary dance, three millennia later.

Another work from the first half of the seventh century—the eponymous Amphora of the Painter of the Heptachord (Fig. 16.3)⁷⁵⁶ celebrates the strength and agility of men. A chitharist accompanies five male figures performing backward somersaults while brandishing swords or pointing spears at the ground. As in the example from Bisenzio, this is a war dance—the Pyrrhics⁷⁵⁷—but while in the earlier one the choral sense prevails, here, as in the London *oinochoe*, the display is more refined and individual. The dance expresses nothing but the unambiguous movement on which the struggle of the line is founded, but also proclaims the agility of the individuals, who accomplish various feats even while armed, emphasizing their ability to confront the most demanding circumstances.

Fig. 16.2: *Oinochoe* of the Painter of the Stretched Horses (detail). London, British Museum

Fig. 16.3: Amphora of the Painter of the Heptachord (detail). Würzburg, Martin von Wagner Museum

Physical prowess is needed in order to leap with the legs together, done by heavily armed men in the war dance on the silver situla of Plikašna, from Chiuse, of the mid seventh century.⁷⁵⁸ At this time, war and military maneuvers had become a caste prerogative, a specialized role that was no longer an extension of an activity that was primarily collective and productive, such as the hunt. The armor of the infantrymen on the situla was prohibitively expensive, and the sword—the main feature of the scene on the

amphora—can only be an instrument of war, and as such has become the symbol of a caste, down to the rapier of the eighteenth-century cavalry and the “sword dances” that survive in certain peripheral areas of the old Europe. Dance, society’s mirror, expresses the rise of a specialized ruling caste. On the one hand, it stresses the homogeneity, the synergy, the skill, the “enthusiasm” of those who perform it, while on the other, it ratifies their distinctiveness from the rest of society, like the galliard of John of Austria.

The *oinochoe* of the Tragliatella⁷⁵⁹ can be dated to the last decades of the seventh century. Again the scenes on this vessel (Fig. 16.4) may be compared with the myth of Theseus and Ariadne. The labyrinth motif incised here, identified by the inscription *truia*, has been related to an equestrian military exercise attested from the time of Virgil (*Aen.* 5.545–603), the *lusus troiae*. In fact, two cavalrymen seem to “come out” of the *truia*, as a line of infantrymen might come out who would process in step, a step that the unarmed individual at the side, who seems to be a mace-bearer, does not participate in. It is not possible to summarize the hypotheses that have been offered, but I would like to dwell on the drawing of the labyrinth. Well attested in the ancient world—including marginal areas like Sardinia (Luzzanas, Tomb of the Labyrinth) or Val Camonica (Naquane, Roccia 1)—the labyrinth reappears in identical form in medieval cathedrals, drawn on pillars (Lucca) or on the floor of the nave, where we have seen it used as the pathway for a dance led by the bishop, an authority whom we still today call *presule* “prelate” like the priest who led the dance of the Salii in ancient Rome.⁷⁶⁰

Fig. 16.4: Tragliatella, *oinochoe* from the necropolis (detail). Rome, Musei Capitolini

3Theseus and Ariadne

And now the time is ripe to explain why we have twice adverted to Theseus and Ariadne. We open this digression, in part not Etruscan, because it allows us to clarify how much of the ancient world we must read through the distorting lens of the primal myth, of our modern difficulty in imagining the

past of *then*. The Homeric description of Achilles' shield is unclear in one point (Hom. *Il.* 18.590–605), where Hephaestus depicts a dance “made” by Daedalus for Ariadne. What image appears on the shield—a dance scene? But how could he render its characteristic motion, described by the poet? Perhaps Hephaestus reproduced a “choreography,” the pattern of movements of a dance—but *choros* is in fact also a dancing-*place*. Hesychius helps by underlining the origin of the word: χορός = κύκλος, στέφανος; and in fact Homer recalls here the motion of the potter's wheel. In this dance, which comprises convolutions, *imitatus intortum et flexuosum iter labyrinthi* (Aphthonius 6.60.1–6 Keil; Marius Victorinus 1.16.14) similar to certain modern Greek or western Alpine dances, the formation maintains its alignment either by holding hands, by a kerchief held by the next dancer, or by a cord (“Ariadne's thread”). The presence of such a cord is known from inscriptions on Delos, where the *geranos* dance was preserved, celebrated by the youths liberated from the Minotaur, the half-bull, half-human “monster” slain by Theseus.⁷⁶¹ The Minotaur—perhaps one of many totemic priests who led dances for initiates dressed as animals, such as the cow-priestess of the shrine of Hera at Argo, the bear-priestess of Artemis at Brauron, or the Hirpi Sorani in Lazio—would find his successor in someone who would slay him in a ritual duel, as for the Rex Nemorensis.

But let us turn to the choreography that is likely to be identified in the labyrinth of the Tragliatella piece. Aphthonius and Marius Victorinus were writing in the fourth century CE. They note that lyric compositions are subdivided into strophe, antistrophe, and epode, and they explain this with the fact that “the ancients” would sing hymns while circling around the altars. The first turn, toward the right, was the *strophe*—that is, progress—given also by the cycle of the seasons; the second was accomplished in the opposite direction; the third part of the hymn was sung standing still. Always “according to the ancients,” at the origin of this practice was either the dance of Theseus, or else the movement of the universe, in which the starry heaven “turns” counterclockwise and the heaven of the planets turns clockwise, while Earth stands still. At the origin of the dance of Theseus and Ariadne, then, stands the motion of the planets. The musicologist G. Chiarini has recognized strophe, antistrophe, and epode in our labyrinth drawing, obtaining exact rhythmic scansion (Fig. 16.5),⁷⁶² that “circulata melodia” imagined in Pythagoras's movement of the spheres by Dante (*Par.* 1.78; 23.109), exalted in the labyrinth dances in the cathedrals. Why has modern man lost consciousness of a “choreography” that Pliny the Elder recalls being traced in the Campus Martius in Rome (Plin. *HN* 36.85) and that survived until the Middle Ages? Because dance has received other forms of notation, and we have lost the perception of the night sky, which the ancients would see as the goal of life and into whose constellations they would project their mythology.

4Archaic and Classical periods

Between the seventh and sixth centuries, the repertory of *bucchero a cilindretto* turned to motifs of line dancing participants holding hands or linking their outstretched arms, sometimes with alternating male and female figures.⁷⁶³ The positioning of the arms and hands here is clarified in a relief from Chiusi from the mid sixth century.⁷⁶⁴ Women move hand in hand in an unambiguous direction, or with open hands and their arms crossed with those beside them.

Fig. 16.5: Choreography with the movements of the strophe (signed +), the antistrophe (signed –), and the epode (A and B), according to Chiarini:

1 = –	A	5 = –	A
2 = +	B	6 = +	B
3 = –	B	7 = –	B
4 = +	A	8 = +	A

In the *cilindretti*, the shallowness of the relief prevents us from clearly reading any of the scenes in which solemn dances (with figures whose hands are joined), or livelier ones (in which the figures move separately), are accompanied by a gift to a seated individual—a ruler or a god.⁷⁶⁵ In still others, such dances are connected with scenes of boxing and armigers,⁷⁶⁶ an activity associated with public and political worth in ancient society (see [chapter 15](#). Thuillier). During the sixth century, dance frequently accompanies such public moments. At Tarquinia, in the tomba del Letto Funebre (Tomb of the Funeral Bed), a dancing girl is painted alongside a Pyrrhic dancer and scenes of athletics, and a dancing cymbal girl appears in scenes of *dokimasia*

in reliefs from Chiusi.⁷⁶⁷

The Chiusan reliefs suggest dances at moments in between the public and the private, such as the *comploratio*, along with horseraces, soldiers, banquet scenes (presumably funereal), and *prothesis*;⁷⁶⁸ sometimes satyrs appear in the dance, to underscore their otherworldly character.⁷⁶⁹

What was the social status of the dancers we have discussed? The warriors of the great choral dances of the Iron Age belonged to what was becoming the ruling class. On the Shield of Achilles, high-ranking youths dance—young men with golden swords, and young women with “fine linen dresses, ... lightly rubbed with oil,”⁷⁷⁰ as in nineteenth-century Sardinia.⁷⁷¹ King David dances. The Salii dance in Rome makes clear that dance is a social ritual, a shared moment; those who do it are not professionals or hired performers, but persons participating in that which is appropriate to their rank, office, and state. The *histriones* recorded in the Roman sources for the first *ludi scenici* or for the annual ceremonies of the Etruscan League appear employed by nobles and king; the actors in such *performances*, however, are persons of rank.⁷⁷²

The scenes met until now pertain to public moments, or private events—death—in their public dimension. In the second half of the sixth century, the architectural slabs of the Tuscania-Acquarossa series⁷⁷³ and the bucchero pesante⁷⁷⁴ display a moment that is private and involves castes together: the *komos*, the orgiastic dance that concludes the banquets of the men of the ruling classes. The dance is again presented with doubled value, difficult for us to grasp fully. The *komos* explodes in a secret location, but it is the climax of an event that identifies an elite, the banquet; it therefore appears in decorations intended to be seen by a wide public, like the slabs that decorate *regiae* and nobles’ compounds.

With the end of the sixth century, dances appear that are performed and celebrated for an exclusively private sphere. The Chiusan reliefs present dances of men and women, associated with the banquet,⁷⁷⁵ as in the enormous murals of the Tarquinian tombs. We see these dances involving the servants but also the gentlefolk themselves. Posidonius—four centuries later—tells us that Etruscan servants were richly dressed,⁷⁷⁶ and that the silk veils⁷⁷⁷ and careful coiffure of the dancing girls can increase the charm of alluring slave girls. But they all also have rich necklaces, and if a young lady holds the *olpe* from which the wine is served (Tomb of the Triclinium), another delivers the cup from which to drink (Tomb of the Lioness) (*Colour plates 27–31*). Nothing allows us to exclude that at least some of these figures share the condition of privilege of those who, on the same walls, come to the banquet. Whether the “masters” were present or actually took part, the dances of the pictures at Tarquinia are danced in the private sphere; they declare the identity and the cohesion of the ruling classes and accentuate the distinction from those who cannot live such happy moments. These dances show us that Etruscan society is connected to a cultural stage that we can liken to a sort of humanism: the choral dances—unisex or mixed, but always within a group—

now are replaced by dances of individuals or couples. While earlier, the movements were solemn or athletic, they are now involved, ecstatic, and impassioned: the angled arms, the head bent forward or thrown back, the twist of the torso express emphasis and a deeply felt dynamic; the garments lewdly stress the beauty of the bodies. The graphic surrender of the dancers, steps, and gestures are especially accurate. The Tarquinian picture repeats the knowledge mediated by Attic pottery, but at this point the artist feels the need to stress the virtuosity of certain steps⁷⁷⁸ and the studied position of the hands,⁷⁷⁹ such as bending the fingers backward as we can see in a certain small figurine⁷⁸⁰ and that is still today a symbol of feminine grace.

We might ask if we are seeing servants or “professionals” in the dance. Perhaps we are in a few cases, but the flourishing youth—well-dressed and self-aware in the painted circles of the tombs—refer to the elegant amusements of a ruling class enriched by commerce, open to the world and to *joie de vivre*, moments that now they wish to immortalize for the afterlife. We cannot exclude the possibility that the chorality of the dances that we saw in the first part of our discussion did survive. The society, however, has changed, because it no longer feels the need to represent these scenes, and continues to allow us to read ever more delicate and intimate details, such as the couple with the woman with her arm on the shoulders of her companion, a drawing found on mirrors⁷⁸¹ and in small bronze figurines.⁷⁸²

5Late Classical and Hellenistic periods

In the first four centuries of its history, Etruria reveals to us a paradigm that proceeds from the totemic choral dance, from the ritual and collective sphere, to the unrestrained, orgiastic dance belonging to a hedonistic class and to courtship in particular. These are different aspects and features of a cultural phenomenon that, again in fourth-century Greece, is confirmed as a fundamental part of society, which Plato provided for in his plan for the ideal state (Pl. *Leg.* 7.796c, 803e, 813b). In Etruria, the iconographic sources on which we have based our fragmentary and partial journey taper off at this time. The ruling classes develop other needs and other ways of representing themselves and their power, and we lose the mirror of the elite, while we continue not to know—nor will we ever know—the dance of the lower classes.

17 Alphabets and language

Abstract: The peoples of central Italy came into contact with alphabetic writing as soon as Greeks and Phoenicians—who had already been using it for some time—began visiting their coasts. Of the two models, the Greek was preferred; it offered a complete alphabetic system of vowels that were derived from the repurposing of certain Semitic letters that originally denoted consonants. During the eighth century bce, the script appears to have already been in use both in Etruria and in Latium, as is attested by a few *sigla* (isolated letters) and brief inscriptions whose reading and interpretation are not unambiguous, which appear to belong to a period that was still experimental. In such an ancient period, an epigraphic culture did not yet exist. Written expression remained a very sporadic phenomenon; the great variability in letterforms derives from the fact that not even in the Greek world had the future epichoric alphabets yet become stabilized, and different graphic realizations were possible in the same locality, including certain crucial choices related to the so-called “bound couples.” (It. *coppie legate*).

The Etruscan alphabet as we know it came into being more or less in conjunction with the birth of an epigraphic culture at the beginning of the Orientalizing period. The first real inscription known to date dates to around 700, but there are a few earlier *sigla* (isolated letter(s)) that, at least in part, must be written in this type of script, and not to the preceding experimental phase. The oldest of these is probably the *siglum* recently found on a wooden vase from Tarquinia (ca. 730). In the Etruscan world, epigraphy arose to meet a need that derived from models of behavior of the aristocratic classes, to which is owed—to a large degree—the birth and development of that entire cultural phenomenon we call “Orientalizing.”

The history of the Etruscan language and its epigraphy is divided into a series of very well differentiated chronological periods. In general, “Archaic” refers to the period from the origins through the fifth century, and “Recent,” to the fourth through first centuries bce. The Archaic period in turn is divided into three parts endowed with very specific characteristics: an initial phase (corresponding to the Early and Middle Orientalizing periods, ca. 730–630), a High Archaic (from 630 to the end of the sixth century), and the Late Archaic. The language certainly had different local and perhaps also social dialects, but their identification has begun only in very recent times.

Keywords: alphabetic writing, inscriptions, *sigla*, Etruscan language

Introduction

The peoples of central Italy came into contact with alphabetic writing as soon as Greeks and Phoenicians—who had already been using it for some time—began visiting their coasts. Of the two models, the Greek was preferred; it offered a complete alphabetic system of vowels that were derived from the repurposing of certain Semitic letters that originally denoted consonants.

During the eighth century bce, the script appears to have already been in use both in Etruria and in Latium, as is attested by a few *sigla* (isolated letters) and brief inscriptions whose reading and interpretation are not unambiguous, which appear to belong to a period that was still experimental.⁷⁸³ In such an ancient period, an epigraphic culture did not yet exist. Written expression remained a very sporadic phenomenon; the great variability in letterforms derives from the fact that not even in the Greek world had the future epichoric alphabets yet become stabilized, and different graphic realizations were possible in the same locality, including certain crucial choices related to the so-called “bound couples.” (It. *coppie legate*).⁷⁸⁴

The Etruscan alphabet as we know it came into being more or less in conjunction with the birth of an epigraphic culture at the beginning of the Orientalizing period. The first real inscription known to date, the “*kotyle Jucker*” (CIE 10159), dates to around 700, but there are a few earlier *sigla* (isolated letter(s)) that, at least in part, must be written in this type of script, and not to the preceding experimental phase.⁷⁸⁵ The oldest of these is probably the *siglum* recently found on a wooden vase from the Tomb of the Warrior in Tarquinia (ca. 730).⁷⁸⁶ In the Etruscan world, epigraphy arose to meet a need that derived from models of behavior of the aristocratic classes, to which is owed—to a large degree—the birth and development of that entire cultural phenomenon we call “Orientalizing” (Fig. 17.1).⁷⁸⁷

What distinguishes an epigraph from other writing is the fact that an epigraph contains a message that has been transmitted across a variety of media, which goes beyond the mere content of the text. Other factors, such as the object inscribed, its meaning, its importance, are indispensable for decoding an epigraph.⁷⁸⁸ For this reason, the birth of an epigraphic culture is a complex phenomenon, which presupposes the invention, spread, and sharing of specific codes that allow the addressee to grasp the sense of the epigraphic message. It also follows that in every culture epigraphs tend to repeat a limited number of formulaic schemata. Etruscan culture—despite the broad diffusion not only of the inscriptions but also of short texts that can almost be considered extemporaneous (names and *sigla* written on objects of daily use)—limited the use of epigraphy to a very few areas, mostly connected to forms of display by the emerging classes of society, which were concretized especially in the sacred and funerary realm. Thus, despite a very respectable epigraphic heritage (some 13,000 texts, including the *sigla*), the number of attested words is quite limited, and, above all, these words are nearly all concentrated in limited homogeneous lexical fields (kinship terminology, names of vessels, names of parts of funerary structures, and sacred vocabulary) (Fig. 17.2).

The history of the Etruscan language and its epigraphy is divided into a series of very well differentiated chronological periods. In general, “Archaic” refers to the period from the origins through the fifth century, and “Recent,” to the fourth through first centuries bce. The Archaic period in turn is divided

into three parts endowed with very specific characteristics: an initial phase (corresponding to the Early and Middle Orientalizing periods, ca. 730–630), a High Archaic (from 630 to the end of the sixth century), and the Late Archaic. The language certainly had different local and perhaps also social dialects, but their identification has begun only in very recent times.

Fig. 17.2: General distribution map of the Etruscan inscriptions

1The script

The Etruscan alphabet originated as an adaptation of the alphabet used by the Euboean Greeks, who were among the chief participants in the earliest visits to the Tyrrhenian coasts. The respect that the Etruscans felt for this model was such that until the end of the seventh century their abecedaries always repeat a sequence that includes Greek letters that were completely useless for the Etruscan language, reproducing the original Greek one, and not Etruscan real use. These included ⟨b⟩, ⟨d⟩, ⟨o⟩, and two different letters for ξ, one of which derived from the Phoenician *samekh* (transliterated ⟨ξ⟩ and never used in Etruscan), and the other of which was cross-shaped, placed at the end of the sequence as it was introduced in the Greek world as a supplement to the original Phoenician order, and transliterated ⟨ś⟩, because it is sometimes used for the phonemes /s/ and /σ/ (Fig. 17.3).

The order of the alphabet, as it appears in the abecedaries of the seventh century (the “first phase” of the history of the Etruscan abecedaries),⁷⁸⁹ is in effect the outcome of a combination of graphic models that were alternatives in the Greek world. In the eighth century, however, the Greek cities had not yet developed those alphabets that would constitute one of the principal hallmarks of cultural identity during the Archaic and Protoclassical periods. Different graphic variants and options could circulate within the same setting, and from the Euboeans themselves the Etruscans became familiar with forms later excluded from the various epichoric alphabets (Chalcidian, Eretrian, and the various colonial forms).⁷⁹⁰ The availability of alternative models is what really made it possible for Etruscan to introduce two different Greek letters into its own alphabetical order to indicate voiceless sibilants that never coexisted in Greek alphabets (except for a single rather peculiar Attic abecedar). The duplication was the necessary result of the fact that Etruscan—unlike Greek—had two voiceless sibilants whose precise phonetic nature remains under discussion. One was presumably /s/, while the other is rather uncertain, to the extent that for its “phonetic” transcription its own conventional sign has been invented, /σ/. In Etruscan writing, because of this requirement, two letters have come to coexist: *sigma* (in Etruscan transliterated ⟨s⟩) and *san* (transliterated ⟨ś⟩; the actual Greek name of this letter is unknown).

In northern (Roselle, Vetulonia, Chiusi, Populonia, Perugia, Arezzo, Volterra, Pisa, Fiesole) and Po-area Etruria the letter ⟨s⟩ was used for the phoneme /σ/, while ⟨ś⟩ indicates /s/; in southern Etruria and in Campania, conversely, ⟨ś⟩ stands for /σ/ while ⟨s⟩ stands for /s/. Veii and Caere were exceptions, where the need to distinguish the two sibilants seems at first not to have existed, such that two variants of the same *sigma*—one with three strokes (⟨s⟩) and one with four (transliterated ⟨ś⟩)—were used to indicate either one indifferently; ⟨ś⟩ appears only occasionally, with an uncertain reading. Yet a third letter, ⟨ś⟩, could be used for both functions. Only much later, in the late

sixth century, did the convention of indicating /s/ with ⟨s⟩ and /σ/ with ⟨ś⟩ stabilize.⁷⁹¹

Fig. 17.3: Etruscan abecedaries

There is an entire series of exceptions to this general rule. The most striking concerns personal names with a sibilant stem (*praenomina* and family names), which come out with the letter <s> in both the south and the north. According to some linguists, the sibilant would have always been /s/, and northern Etruscan would have had specific orthographic standards for this /s/; in some cases, it would have been written with <s> and not <ś>. According to others, orthographic standards would have always been the same, and therefore personal names with sibilants would be pronounced /σ/ in the north and /s/ in the south, simply according to dialectal differences. The question has not been resolved.⁷⁹²

Another feature that distinguishes northern and southern writing is the choice of letters to indicate the voiceless velar /k/. The north adopted the simplest solution, the Greek letter <k>. In the south, however, a rather complex system developed: <k> is used only before <a>, <q> before <u>, and in all other cases <c>—that is, the sign for *gamma* (in its lunate form, which is one of the possible graphic realizations of the letter in Euboian writing)—which in Greek renders the phoneme /g/, which did not exist in Etruscan. This graphic rule (known as the "*kacriqu* rule" from a word found in the inscription *CIE*

10159 that contains all three letters) gave rise to quite a lot of confusion, but was gradually simplified, until the eventual disappearance first of ⟨q⟩, then of ⟨k⟩. Beginning at the end of the sixth century, in southern and Campanian Etruria, the sound /k/ was written only with ⟨c⟩.

The sole addition made by the Etruscans to the Greek alphabetic model consists of the sign 8 ⟨f⟩. Probably taken over from the Sabine alphabet, it appears in inscriptions toward the end of the seventh century, and in the abecedaries only in the next century, in connection with the suppression of the “dead” letters ⟨b⟩, ⟨d⟩, ⟨o⟩, and in the north also ⟨c⟩, ⟨q⟩, and ⟨s⟩). Its position, of course, is last in the sequence. The phoneme /f/, absent from Greek, had originally been written with a digraph, ⟨vh⟩ (once in a while ⟨hv⟩); in far southern Etruria (Caere especially, but also Veii), where there was considerable resistance to the introduction of the new letter, this usage persisted until the end of the sixth century.

Word dividers appear sporadically already in the seventh century, while in the older inscriptions words are normally not separated (*scriptio continua*). Only in the Late Archaic period (late sixth century) does word division become much more frequent, eventually becoming generalized. Cases of *scriptio continua* in the later period are very rare.

A special Etruscan invention, probably originating in Veii, is syllabic punctuation, the marking with dots of every letter (consonants and vowels) that occurs in other than open syllables, but also of vowels apparently conceived as being outside syllables. Most of the inscriptions with syllabic punctuation come from the sanctuary of Portonaccio at Veii, but a small number have been found in other centers in the region's south. It was used almost exclusively in the sixth century, basically ceasing at the beginning of the fifth, with the sole exception being in the area of Capua, where it persisted a little longer.⁷⁹³

After an early period when texts were written either rightward or leftward (as had also been the case in the Greek world), the Etruscans opted definitively for a sinistrograde (right-to-left) ductus, which remained the rule for the entire duration of Etruscan epigraphy. There are, nevertheless, a few exceptions. For example, in the same southern area (probably centered on Veii) that introduced the letter ⟨s⟩ and syllabic punctuation, a brief reemergence has been observed of a preference, or at least concurrence, of a dextrograde ductus. Captions could sometimes be written dextrograde (for aesthetic reasons), and some very late Etruscan inscriptions are also dextrograde, clearly under the influence of Latin (while the only known example of a Latin inscription in the Etruscan alphabet is sinistrograde: CIE 2647). Boustrophedon writing, especially appreciated in some geographic and thematic contexts of archaic Greek epigraphy, is completely unknown in the Etruscan world. There are, on the contrary, a few pseudo-boustrophedonic texts in which the ductus is always sinistrograde, but every other line is upside down, giving the false impression of boustrophedon.

The use of line breaks appears relatively late in Etruscan epigraphy; nearly all inscriptions earlier than the end of the sixth century maintain an uninterrupted continuity in the flow of the text, following a circular, serpentine, or labyrinthine course. Only beginning in the late sixth century, following a major change in the conceptualization of writing that probably matured in the context of the sanctuary, did line breaks regularly come into use, even in the middle of words. On the other hand, the simultaneous generalization of word dividers made it possible to avoid incomprehension in reading texts.

2The language

The available evidence limits our understanding of the Etruscan language. Nearly every inscription repeats a limited number of formulas, in which a good part of the text usually consists of personal names (or divine names, in the case of sacred inscriptions). On the other hand, the inscriptions that do not fit these formulas remain to a great extent not understandable, because it is not possible to grasp—other than in a very generic way—the meaning of a word attested only once or twice (or even several times but only in a single text). Studies over the last three decades, however, have brought substantially complete understanding of the structure of the language—albeit limited to the types of text available to us—to the extent that, even when we are faced with an untranslatable inscription, it is nevertheless possible to grasp the general purport and the grammatical roles of the individual words (nouns, verbs, pronouns, etc.).⁷⁹⁴

2.1Phonology

Etruscan phonology has been reconstructed on the basis of Etruscan words transliterated into Latin and, secondarily, of Greek words transliterated into Etruscan letters. There is a series of quite individualized phenomena; here we will refer only to those of general interest that are essential for understanding the principal facts of the language. The most important point is the presence of a strong accent on the beginning of the word (or at least on one of the first syllables). This led to the gradual loss of the following vowels, beginning with the one immediately following the accent (posttonic), with the sole exception of those with semantic value. This is the phenomenon known as “syncope,” or more specifically “Etruscan syncope.” Archaic Etruscan looks to us like a highly vocalic language, with words composed primarily of open syllables; with the passage of time, the appearance of fluctuations of vowel color (especially of posttonic vowels) leads us to understand that syncope had

begun to operate. Nonetheless, the archaic orthographic norms continued to be almost fully respected until the end of the sixth century; at this point, with the onset of the Late Archaic period, the old rules entered into crisis. The fifth century is characterized by the coexistence—even within a single inscription—of vocalized and syncopated forms. With the beginning of the Recent period, a new, completely syncopated orthography became generally accepted; Recent Etruscan is distinguished by the presence of long sequences of consonants. Some of these sequences are virtually unpronounceable, and it must be supposed that in reality vowel sounds came into play to facilitate pronunciation; a trace of this comes to light in the sporadic practice of “Etruscan anaptyxis,” the occasional insertion of vowels into the longer consonant sequences, which often reproduce the color of the tonic vowel.

Other phonological phenomena (monophthongization, fluctuation in vowel color, etc.) are mentioned below only where necessary. There are also traces of dialect phonology (such as the change *e* > *i* often found in Archaic northern Campania, or the systematic *θ* > *z* in the Etruscan of Rome) that require further study for proper interpretation.

2.2 Nouns and names

Etruscan nouns and names appear to us to be declined by means of certain suffixes that were attached to nominal stems. These suffixes have one function each, and they can pile up; this type of structure characterizes the languages called “agglutinative.” It is very likely that Etruscan should be considered an agglutinative language, as shown by—among other things—the rather generous use of enclitic pronouns that could be added to sequences of suffixes.⁷⁹⁵

Etruscan seems to have had two grammatical genders, which in the broadest terms can be called animate and inanimate. The two genders are distinguished by the plural suffix, which in the animate is *-r* (preceded by a vowel in consonant stems), in the inanimate *-χva*, *-cva*, *-va*. Nouns of inanimate gender do not have a plural suffix when they are preceded by a numeral. Plural divine names can have either the animate or the inanimate suffix. Only in personal names (individual or family) is there a distinction between masculine and feminine gender.

Etruscan nouns appear to us to be divided into two classes, whose cases use different suffixes. The first class includes all vocalic stems (except female personal names in *-i*) and stems ending in *-l*, *-m*, *-n*, *-r*, *-χ*, as well as animate plurals. The second class includes all the other consonantal stems, female personal names in *i*, and inanimate plurals.

We know of only four grammatical cases with an acceptable degree of certainty, conventionally called *zero case* (no suffix), *genitive*, *pertinentive*, and *ablative*. The genitive of the first class is formed with the suffix *-s*

(preceded by a vowel as necessary on consonant stems); the second class takes a suffix that in the Archaic period was written *-a* or *-ala*, while in the Recent period it is *al* (but also *a* in the genitives of female names in late inscriptions of northern Etruria); stems in *-θ* can insert an *-i-* between stem and suffix.⁷⁹⁶ The *-i* of female personal names, on the contrary, often disappears before the suffix. The pertinive is formed in both classes by adding a second suffix *-i* to the genitive; in nouns of the second class since the older period it exclusively has the monophthongal form *-ale* (< **-ala-i*). The ablative uses a suffix *-is* for nouns of the first class, with *alas* for the second class (it becomes *-als* in the Recent period). In consonant-stem nouns of the first class, the suffix is always preceded by a vowel (as far as we know, always the same vowel that connects the genitive suffix), while on stems in *-a*, the result is monophthongized (**-a-is* > *-es*).

There are a few other cases besides these that use the same suffixes without distinction between the two noun classes; the best known is the *locative* (with the suffixes *-i*, *-θi*, *-ti*, and *-iθi*: the first and last may be involved in monophthongization after *-a*, e.g. *rasna-i* > *rasne*). Other cases (such as that using the suffix *-pi*) are too little known to be able to determine their meaning. Some nouns can have two different stems, for the zero case and for the others; the ones known to us with certainty are *clan* (“son”) and *Turan* (divine name), which form all the oblique cases on the stems *clen* and *Turn*.

The zero case normally indicates the subject or object of an action, thus performing the functions that in other languages are carried out by the nominative and the accusative. Additionally, it is used for the complement of the continuous tense.

The genitive case takes its name from the fact that it is most frequently used to mark possession or filiation, just like the genitive of many other languages; however, the Etruscan genitive can also mark the recipient of a gift and a person’s age.

The pertinive case occurs only in three specific, very well-defined syntactic contexts. In gift inscriptions with a passive verb it marks the donor; in other gift inscriptions, it marks the indirect donor (a subject gives something to someone—often a god—on behalf of someone else); lastly, the name of the magistrate in date formulas is always in the pertinive (while the name of the office takes the locative suffix).

The ablative case is always used in agent complements—it identifies the agent of an action expressed with a passive verb.

In addition to these cases there are several other suffixes, some of unknown meaning. The better-known ones are *-θur* (which seems to us almost always to occur on family names, serving to indicate the community of members of the family) and *-tra* (usually translated as “by,” although recently some doubts have been expressed on this score). Both of these suffixes are in turn regularly declined according to the first class. There is also a postposition—*ceχa*—which is known to us almost exclusively in the phrase *clen ceχa*, equivalent to

pro filio “in favor of / on behalf of the son.”

There are some exceptions to these standards, the reasons for which escape us entirely.

2.3 Verbs

Etruscan verbs exhibit two main series of suffixes: those in final position (obligatory, and therefore fairly clear as to their meaning), and those that occur between that set and the stem, rather controversial as to their meaning because of the exiguity of the documentation. Here we will concentrate only on the final suffixes of verbs, those that are more common and well-interpreted.

There are no suffixes for the person of the verb. In practice, the Etruscan verb form is always the same regardless of the number and person of the subject. Every Etruscan sentence, therefore, includes an indication of the subject of every verb.

The bare stem, without suffixes, has *imperative* meaning; the suffix *-a* (conventionally called “subjunctive”) is always used in jussive clauses, often negative ones; the suffix *-ce* indicates completed action (it is a sort of perfect), and *-χe* is its equivalent in passive forms; the suffix *-e* (sometimes called “present”) indicates continuous action. There is also a suffix *-ne*, certainly passive, whose difference from *-χe* is not well understood.

There are at least two forms of participle. The first, marked by *-as(a)/-θas(a)*, indicates continuous action; the second, with the suffix *u*, indicates completed action.

2.4 Pronouns

The Etruscan language has a large number of pronouns, many of which also (or only) occur as enclitics. The declension of pronouns partly differs from that of nouns; the main difference consists of using a specific suffix, *-n*, to mark the accusative. Moreover, despite all the pronouns (except the personal pronouns) that end in *-a*, the normal form of the genitive takes the suffix of the second class *-ala* (and consequently the pertinentive suffix is *-ale*, although the actual meaning of the pertinentive of the demonstrative pronouns is still under discussion, because it does not seem to be consistent with that of the pertinentive of nouns). The ablative, on the contrary, is formed with the suffix *-is* of the first class. There are two forms of locative, one with the suffix *-i* and one with *-θi*, the latter added to the base of the genitive. The suffixes *-i* and *-is* change the *-a* of the stem to *-e*, but do not always bring about monophthongization. The plural takes the suffix *-va*.

The most widely used pronouns are the enclitic definite article *-śa* and the demonstratives (sometimes enclitic) *ica* and *ita*, which in the Recent period become *eca/ca* and *eta/ta* when not enclitic, and *-ca* and *-ta* when enclitic. The complete declension follows, confined to known forms:

-śa: genitive *-śla*, pertinentive *-śle*, locative *-śe*; plural: 797 genitive *-śvla*, pertinentive *-śvle*, locative *-śve*.

ica: accusative *ican*; *ita/ita*, acc. *itan*, *itun*; gen. *-itala*, *-itula*, pert. *-itale*, *-itule*.

eca/ca: acc. *ecn/cn*, gen. *-cla*, pert. *-cle*, locative *cei*, *eclθi*, *clθi*.

eta/ta/-ta: acc. *etan/tn/-tn*, gen. *-tla*, ablative *teis/-tis*, loc. *tei*.

The enclitic determinative *-śa* when it follows *-s* produces regressive assimilation (**-s-śa* > *-śa*), while after *-l* it requires the insertion of *-i-*.

The difference in meaning between *ica/eca/ca* and *ita/eta/ta* is not clear; both can indicate the object on which the inscription appears, so that they could mean “this.” In addition to these there are other demonstrative pronouns, including some compound forms.

Among the personal pronouns, the only one known with a degree of certainty is the first person singular, *mi* (“I”), with accusatives *mini*, *mine*, *mene*. Among the relative pronouns, *an* (“who”) occurs with considerable frequency; it is likely that the form *in* (for which an accusative *inni* is also known) corresponds to *an* for inanimate subjects. The meaning of many other pronouns is still controversial.

2.5 Other parts of speech

Etruscan adjectives are particularly elusive; they agree in gender but not number.

The negation is *e/ei/ein/en*. The most common conjunctions are the enclitics *-c/-χ* (perhaps *-ca* in the Archaic period) and *-(u)m*.

2.6 Numbers

The Etruscan numbers from one to six are: *θu*, *zal*, *ci*, *śa*, *maχ*, *huθ*; in compounds *θu* becomes *θun*, and *zal* becomes *esl*. Ten is *sar*, twenty is *zaθrum*, while *enza* must be eleven or twelve. From the numbers for three, four, and five are derived *cealχ*, *śealχ*, and *muvalχ*—thirty, forty, and fifty. The numbers *semqalχ* and *cezpalχ* indicate some tens greater than sixty; given that they occur in notations of age, practical considerations suggest they mean seventy and eighty rather than ninety. Repetition is marked with the suffix *-z(i)*; the form *nurqzi* is probably based on the otherwise unknown number for nine. As for the compounds, the numbers through six agree in forming them

with an additive system, with the units before the tens (*max̣ zaθrum*, twenty-five), from seven on with a subtractive system, by means of the infix em- between the unit to be subtracted and the following ten (*eslemzaθrum*, eighteen). For the word *cepen*, certainly a quantifier, the translation “all” has been suggested, which seems to fit in at least most cases.

2.7 Onomastics of persons

The basic structure of the Etruscan personal name consists of an individual name and a family name inherited through the patrilineal line. This onomastic system is common to most ancient Italic peoples, regardless of their individual languages, ethnic identities, or historical and political structures; its codification in Roman law guaranteed its survival until this day. The origin of the gentilic system, at least in the Etruscan world, probably predates the beginning of epigraphic writing; some of the earliest Etruscan inscriptions show it already in operation.⁷⁹⁸

2.7.1 Praenomina

The *praenomen* is the name that identifies a particular individual; by definition the *praenomen* must be followed by a family name. If someone has only one name and no gentilic (as in the case of foreigners or slaves), it is called the “individual name.” In the Archaic period there was an enormous number of *praenomina*, so when an inscription contains no gentilic (which happens fairly often), it is nearly impossible to determine whether it deals with a *praenomen* or an individual name. Also, many Archaic *praenomina* are formed with the same suffixes as the gentilics, so an isolated name can sometimes be interpreted either as a *praenomen*, an individual name, or a gentilic.

The great majority of female *praenomina* appear to be secondary and are derived from a male form with the addition of the suffix *-ai/-i* or, less often, *-ia/-a*, which is common in many Italic languages, including Latin. Independent female *praenomina*, however, do exist.

Already in the Late Archaic period, the number of *praenomina* began to diminish, until they were reduced to a handful in the Recent period. This phenomenon nearly simultaneously affected every peninsular Italian people that used the gentilic system. Beginning in the fourth century, almost every Etruscan was called Arnθ, Aule/Avle, Vel, Velθur, Velχe, Larθ, or Laris; in the north of the region the *praenomina* Lauχmes (or Lauχme) and Leθe are also found, while in the south, Latin/Italic-style *praenomina* like Cae, Marce, and Tite were used. The female *praenomina* are Arnθi, Velia, θana, θanχvil, Larθi/Larθia, Ravnθu/Ranθu, Ramθa, and Fasti/Hasti or Fastia/Hastia. There are very few exceptions, and often they are exclusive to certain families. One

of the consequences of this big reduction in *praenomina* is the practice of abbreviating them in inscriptions, which became ever more widespread especially after the late fourth century.

As is easy to guess, in the Recent period it becomes possible to distinguish the *praenomina* from the individual names. It is highly probably that any name that appears alone in an inscription and that is not included in the small set of accepted *praenomina*, is an individual name. This is especially important considering that the epigraphic record of the Recent period is much fuller than that of the Archaic, and reaches a larger portion of society. Even subordinate social groups—whose economic success was facilitated by the general conditions of Middle and Late Hellenistic Italy—were able to achieve their own epigraphic expression, a fact that in the exclusionary Archaic epigraphic practice had been all but impossible.

Also confined almost entirely to the Recent period is the appearance in inscriptions of altered forms of *praenomina*, which are usually considered diminutives/hypocoristics. Among the most common constructions are those with the suffixes *-za* (male: Arnza, Larza), *-cu* (female: Θanicu). Given that these forms never appear in filiations,⁷⁹⁹ it is highly likely that they are not official *praenomina*, but formations used exclusively within the family.⁸⁰⁰

There is a series of epigraphic occurrences typical of the Recent period that involve the *praenomen*. The most widespread is the reversal of *praenomen* and gentilic, which occurs in the southern region, especially Tarquinia, reaching its peak of attestation during the third century.⁸⁰¹ Another is the omission of the female *praenomen*, which is found especially in the area of Chiusi throughout the second century only to disappear almost completely toward the end of the century; in this case, it is likely that there was a desire to reproduce the onomastic formula used by Roman women (for whom, uniquely in Italy, the *praenomen* was not part of the official name).

2.7.2 Gentilics and cognomina

The gentilic is the family name transmitted through the patrilinear line; the *cognomen* is a second family name, also transmitted through the patrilinear line, which serves to distinguish the various branches of a family. The use of the *cognomen* is limited to a few geographic and cultural environments, and nearly exclusively in the Recent period, and will be dealt with further on.

The gentilic is essentially a patronymic adjective—that is, it identifies a group of individuals who can trace their own family tree back to a common ancestor (real or imaginary). Many gentilics are formed using a limited number of suffixes. The most common is *-na*, followed by *-ie*, which is nothing but an Etruscan importation of the Latin/Italic suffix *-ios*, which has exactly the same function. These two suffixes can also be found together (*-naie*; much rarer is the opposite case *-ie-na*, in which a simple gentilic in *na* can often be recognized, with the *-ie* already present in the individual name /

praenomen added to the base of the gentile itself: for example, Velθiena is Velθie-na). The double suffix *-naie* in the Recent period evolves into *-ne* or *-ni* (the latter preferred in Perugia, found in Cortona, rare in Chiusi, and manifested in parallel with a possible evolution *-ie* > *-i* that can be found in the same areas, especially—but not only—when *-ie* follows a stem ending with *-n*: for example Latinie > Latini).

Other suffixes that are fairly common in the formation of gentiles are *-u*, *-ane*, and *-ate*, the last two of which primarily refer to a geographic origin (for the first of them, comparison with Latin/Italic *-anos*, of identical function, is inevitable: for example Campane, Laucane = *Campanus*, *Lucanus*, etc.). A special class of gentiles is constructed with the suffix *-alu*, probably of Celtic origin (the suffix *-alo* was used in the ancient Celtic language of northern Italy, the so-called “Lepontic,” to form patronymic adjectives). These gentiles appear to be concentrated especially in the Etruscan Po region, and also with higher frequency in northern Etruria proper (especially Chiusi). In view of the primarily late chronology of these last attestations, it must be asked whether they might not concern refugees from Po Etruria after the great Celtic invasion of the fourth century.⁸⁰²

There are also gentiles with apparently anomalous suffixes, the most striking case of which is the gentiles in *-e*, which sometimes appear identical to certain *praenomina*. In many cases it is possible to reconstruct the phonetic history of these names, which attests that *-e* would be the outcome of an Archaic *-aie*, which evolved by the loss of the intervocalic *i* and contraction of *ae* > *e*. The best-documented cases are Leθaie > Leθae > Leθe and Velχaie > Velχae > Velχe, but there are many others (such as Pupaie > *Pupae > Pupe). They are thus ordinary gentiles in *-ie*; the identity with the *praenomina* derives from the fact that these too had been formed with the suffix *ie* (a frequent occurrence in the Archaic period). In the area where *-naie* could yield the Recent outcome in *-ni*, and *-ie* in *-i*, these onomastic formations risingly often have an outcome *-i* that distinguishes it from the corresponding *praenomina* (for example, the gentile Velχe is Velχei at Perugia).

Entirely different is the case of the “individual name gentiles,” or gentiles that are identical to individual names and have no gentile suffix at all. It is very likely that these gentiles preserve a trace of the admission to citizenship of persons or families who originally had no gentile, foreigners or slaves, in view of the notable similarity with the process of acquisition of a gentile by freed slaves (see below). Foreign origin in some cases is obvious in the very form of the gentile. It is likely that many of these acquisitions of citizenship took place in a rather early period, so as to have permitted sometimes quite amazing careers to these families. One thinks of the members of the Tarquinian Velχa family, whose gentile is identical with the individual name on which the *praenomen* and the gentile Velχaie are built, as has been indicated, and which, when it appears in the epigraphic record, are securely installed at the head of local society.⁸⁰³

All the gentilics, regardless of their various origins, have a feminine normally formed by adding the suffix *-i*; less common is the suffix *-ia/-a*, which was preferred, especially with masculines in *-i* (except for those in *-ni*, where the feminine is normally the same as the masculine). As for gentilics with a masculine in *-a*, the feminine ending *-a-i* can evolve into *-ei* and sometimes further into *-e*; if the masculine ends with *-(i)e*, the feminine normally evolves into *-i*.

A separate case consists of unsuffixed gentilics, which are especially widespread in the area of Volsinii and Chiusi, where the unsuffixed forms are more often *cognomina*. These are entirely anomalous forms, in some cases formally identical with divine names (Hercle, Caθa, Tins) or nouns, which are distinguished from all other family names (including the “individual name gentilics”) by their analogical feminine form that is constructed by adding *-nei* (sometimes *-nia* in *cognomina*) to the masculine base form, which clearly was perceived as lacking any suffix.

Cognomina, although they are already found (though extremely rarely) in the Archaic period, spread especially in the Recent period; they are attested especially at Perugia and Chiusi, less commonly elsewhere. Typical for Perugia are *cognomina* formed with the suffix *-na* (which is fairly rare among Perugine gentilics in contrast to the rest of Etruria); in all other cities—especially Chiusi—the *cognomen* forms are highly varied, and commonly unsuffixed. In the cities where *cognomina* are more frequent (Chiusi and Perugia), the inscriptions can omit the gentilic. Peculiar to Chiusi is the attachment of the enclitic definite article to some *cognomina* (never to the feminine).

In conclusion, it is necessary to mention the phenomenon of the so-called “functionless genitive,” which is found throughout Etruria beginning in the last decades of the seventh century. From the beginning of the sixth century onward, every gentilic (except for those with the double suffix *-na-ie* and the rare unsuffixed ones ending with a consonant) appears with the added desinence *-s*—formally identical to the genitive—which does not involve declension (in practice, the zero case and the genitive fall together). In connection with this phenomenon, the masculine form of the gentilic extended in this way can also be used in female onomastic formulas (as happened especially at Caere, but also elsewhere). The regularity is such that the “functionless genitive” must have derived from some standard that was widely shared by all the Etruscan cities—certainly not a linguistic standard, but an onomastic one. This form continued to be used everywhere until the end of the fourth century, and disappeared gradually during the third, with the sole exception of Perugia, where the gentilics still continued to appear with the “functionless genitive” in great profusion throughout the second century, if not beyond. *Cognomina*, too, can have the “functionless genitive,” in a few cases even separately from a gentilic, which happens especially during the period of gradual disappearance of this form, between the second half of the

2.7.3 Filiation

Filiations, which almost exclusively appear in Recent period inscriptions, are formed from the *praenomen* of the father in the genitive, unmarked or with the enclitic definite article, or else followed by *clan* (“son”) or *seχ* (“daughter”). If the *praenomen* is abbreviated, the qualification does not appear. The only exception is found at Caere, where beginning in the first half of the third century, the abbreviated paternal *praenomen* can be followed by the *siglum c* or *s* (for *clan* or *seχ* respectively). This practice at Caere in all probability conforms to Roman epigraphic traditions as a result of the admission of its residents to Roman citizenship, albeit *sine suffragio*, at some point between 390 and 270. Very rare is the citation of ancestors other than the father; indication of a grandfather can be followed by *papals* (“grandchild”).

2.7.4 Matronymic and gamonymic

The official onomastic formula of the Etruscan citizen, as is the case in all the civilizations of the Italian peninsula, consisted of *praenomen*, gentilic, and filiation. Every other element was an addition that could aid in more closely identifying the person, but it was not part of his name as it was officially registered. The matronymic (name of the mother) and the gamonymic (name of the husband) are the most widespread of these unofficial elements, and they owe their frequency to the special concentration of Etruscan inscriptions in family funerary complexes. After occasional Archaic appearances, matronymics and gamonymics find their apotheosis in the long inscriptions displayed in the tombs of the great southern Etruscan (especially Tarquinian) families of the fourth century whose purpose was to record the matrimonial ties that cemented alliances between the families of the city’s highest aristocracy. But the greatest spread of the use of these onomastic elements began in the early second century in the area of Chiusi and Perugia, with the purpose of correctly identifying the great number of decedents that crowded the funerary chambers—since the use of cremation in northern Etruria made it possible to include in any tomb a number of depositions far greater than was the practice in the southern region. If we recall that in this period very few *praenomina* were used (many families tended to have no more than three or four), we understand how within a genealogy, matronymy could take on an identificatory function far greater than that of the filiation. It is true, though, that in more recent Clusine and Perusine funerary epigraphy, even the filiation itself can be omitted.

The matronymic usually consists of the mother’s gentilic (sometimes the *cognomen*, occasionally both) in the genitive, possibly followed by the

enclitic definite article; in a few rare cases the *praenomen* can also appear, or even the *praenomen* alone, again sometimes with the enclitic definite article. In a few cases the qualifier *clan* or *seχ* appears, and matronymic and filiation can be can be linked together by a conjunction

The gamonymic consists of the gentilic (and/or the *cognomen*) of the husband in the genitive, sometimes accompanied by the *praenomen*; in a few cases the qualifier *puia* (“wife”) appears. The use of the enclitic definite article seems to relate to local epigraphic traditions: at Chiusi nearly always, at Perugia never.

2.7.5Slaves and freedmen

The names of slaves consist of an individual name followed by the owner’s gentilic in the genitive, according to the most widespread formula in all Classical civilizations. In the Archaic period, the owner’s gentilic in the genitive is followed by an enclitic pronoun *-sa* (not to be confused with the definite article *-śa*), which disambiguates the slave formula. In fact, if we recall that many different *praenomina* were in use in this period, and the gentilics normally appear in the “functionless genitive,” the use of a simple genitive might have made it possible to confuse the name of a slave with that of a free man. In the Recent period, when this risk no longer existed, the pronoun *-sa* disappears. The nonoccurrence of the first onomastic element in the restricted group of *praenomina* made it easy enough to identify the slave.

The freed slave becomes a citizen (we do not know what rights he had), and his new status is evidenced by the adoption of a gentilic. This gentilic is formed from the slave name, which is now preceded by a *praenomen* and becomes hereditary; the name of the former owner in the genitive followed by the qualifier *lautni* (“freedman”), feminine *lautniθa* (“freedwoman”), sometimes abbreviated, specifies the status of the individual. The sons of a freedman thus have the onomastic formula of a citizen with full rights, even though their gentilic transmits their origin forever, especially when, starting at the beginning of the second century, the slaves, who in large part came from the markets in the eastern Mediterranean, often had Graecanic names.

There is also a series of inscriptions of freedmen concentrated in Chiusi and Perugia in which the gentilic of the former slave reuses that of the former owner, according to Roman practice. These are obviously slaves who were freed after 90 BCE, when, as a result of the *lex Iulia* that granted Roman citizenship to all the free inhabitants of Italy south of the Po, the Etruscan cities adopted Roman law.

2.8Linguistic relationships

In the present state of our knowledge, Etruscan appears to be related only to

two ancient languages: Raetic, spoken in the upper and middle valley of the Adige,⁸⁰⁵ and Lemnian, the language of the original inhabitants of the island of Lemnos, in the northern Aegean. Lemnian is completely unrelated to the languages spoken in the Aegean and Asia Minor and appears today to be an entirely isolated language; it is impossible to establish whether it had any connection with the indigenous dialect of the nearby island of Samothrace, which is still entirely incomprehensible (Lemnian and native Samothrace writing, in any case, are virtually identical).⁸⁰⁶ It must not be forgotten, in any case, that we do not know what languages were spoken in many regions of the ancient world, and it remains possible that there were other languages related to this group about which we have no information.

3Epigraphy

3.1First period (from the origins to ca. 630)

The first period of Etruscan epigraphy offers a rather uniform appearance. Epigraphic culture began in Etruria in the exclusive service of the uppermost classes of society, and to express a function strictly connected with behavior typical of the aristocracy—the gift circuit. The exchange of gifts between persons serves to mark the mutual acknowledgment of belonging to a highly exclusive circle. The objects exchanged acquire an enormously symbolic significance, which has nothing to do with the actual market value of the object itself. Its meaning resides entirely in the social status of the donor of the gift, who implicitly acknowledges the recipient as his equal. These objects are effectively symbols that could be passed on an infinite number of times.⁸⁰⁷ All the Etruscan inscriptions of the first period are on items that served as gifts and serve to record its first owner (and hence its first donor). The earliest syntactic form is that of an ownership inscription, in which the object speaks in the first person (“I am...’s”). Subsequently, beginning in the middle of the Orientalizing period (second quarter of the seventh century), gift inscriptions appear in which the act of giving is explicitly recorded. These always include the donor, but the donee appears only sporadically, given that “regifting” was always possible. This period also yields some more complex epigraphic texts, for which a metric structure is conjectured (similar to many contemporaneous Greek inscriptions). They are largely uninterpretable, but they always contain short phrases that name the property and/or the gift so that their general meaning can be determined.⁸⁰⁸

In this period, writing probably circulated in a highly limited social sphere; in this context needs to be placed an attempt (that quickly failed) at graphic reform, with the adoption of hooked ⟨c⟩ (and obviously, as a result, of three-stroke ⟨p⟩), following the forms preferred in the seventh century in the

Euboean metropolitan and colonial areas. The texts that follow this reform (including an abecedary, *CIE* 11445) are found in the very heart of Etruria, and they reflect the circulation of objects and ideas among the aristocratic classes transcending political borders.

3.2 High Archaic period (630–510/490)

With the Late Orientalizing period, the use of epigraphy expanded to many other areas of civic life, reflecting the major changes that affected Etruscan society. The proprietary inscriptions and those related to donation continued to play an important role, although their circulation seems to have changed. The notices of possession in many cases no longer imply a destination of the object in the gift circuit (to be sure this usage continued sporadically until the Recent period), while notices of donation are increasingly used to express consecration to a god. Every Etruscan city in this period certainly had an active local scribal school, which developed one or more types of urban writing; they are distinguished by particular idiosyncrasies in the shapes of the letters.⁸⁰⁹

Beginning in the sixth century, the sanctuaries began to take on a central role in the production and circulation of written materials. It is not by chance that a major reform of Etruscan writing, which introduced syllabic punctuation, the character (ś), and at least in some cases the dextrograde ductus, should probably be ascribed to the suburban sanctuary of Portonaccio at Veii. This reform, although it was destined to fail, was to have a great impact on the history of southern Etruscan writing.⁸¹⁰

Already in the same period, and increasingly through the Archaic period, the tomb began to take shape as a privileged sphere for epigraphic expression of private commissions. The first group of funerary inscriptions appears, using many kinds of surfaces and not yet standardized; a favorite formula was the “talking inscription,” where the object itself declares that it belongs to a specific individual.⁸¹¹ Only at Volsinii (Orvieto) did a uniform epigraphic culture develop in the funerary realm, in response to a strictly local need—the attribution of the chamber tombs built in groups in the necropolises of the Crocifisso del Tufo and Cannicella.⁸¹²

3.3 The Late Archaic period (Fifth century)

Between the late sixth and early fifth centuries, many of the epigraphic expressions of the High Archaic period tend to disappear; private epigraphy was confined almost exclusively to inscriptions on portable objects. At the same time, the use of inscriptions tended to focus on the sanctuary; elaborate

expressive forms would come into existence specifically for consecrations and dedications to gods. All the inscriptions made with special care inevitably had a sacred purpose. They are often on metal (gold, bronze, lead), and sometimes of considerable length and complexity. Among the most famous, of course, are the “Pyrgi tablets” (three texts—two in Etruscan and one in Phoenician—that record the dedication of a temple in the sanctuary by the lord of Caere, Thefarie Velianas) (Fig. 35.2) and the *tabula Capuana*, a ritual calendar incised on a slab of terra-cotta (Fig. 35.5). The group (small in number) of funerary stelas from Felsina is the only display of private monumental epigraphy in this period.

The extraordinary productivity that had characterized the Archaic period in the field of the elaboration of graphic fashions was almost completely exhausted, and writing then underwent a thorough standardization. It is in this period that the three basic graphic types that characterize the Recent period were elaborated: the northern, the Tarquinian-Vulcian, and the southern-Tiberine (typical of Caere, Veii, Volsinii). As has been mentioned above, it was during this period that orthographic practice gradually changed, and line breaks were introduced.

3.4 The Recent period (fourth–first centuries bce)

Most Etruscan inscriptions belong to the Recent period. The extraordinary increase in quantity in this period is due to the widespread use of funerary inscriptions. Just about every city elaborated its own specific funerary culture in which inscriptions have a well-determined place. In most Etruscan cities, the use of inscriptions remained confined to a fairly restricted segment of society; only at Chiusi and Perugia (and their territories) did funerary epigraphy generalize to involve every member of society who was in a position to achieve formal burial (Fig. 17.4).⁸¹³

Alongside funerary inscriptions, sacred inscriptions also took on monumental forms and complex standardized formulas. The gift in the sanctuary, in fact, alongside the burial, is one of the privileged loci of ostentation, and inscription was its efficacious tool.⁸¹⁴

introduction of ⟨m⟩ as an inverted V, which derives from a cursive form of this type of script; the spread of this form remained strictly local, reaching as far east as Cortona.⁸¹⁵

Beginning in the second century, some new classes of epigraphy that clearly follow Roman models appear. These include stamps on ceramics and tiles, and the first public inscriptions, on stone and bronze. Until this time, there had been no inscriptions of a purely public nature in the Etruscan world, with the sole exception of those within sanctuaries, which is a fact that distances Etruscan epigraphy from all the other epigraphic cultures of the Italian peninsula.⁸¹⁶ Equally due to interference from Latin epigraphy is the replacement, in many inscriptions of the northern area, of ⟨ś⟩ by ⟨s⟩, which led to a few rare cases of the reverse by hypercorrection.

The use of Latin in private epigraphy appears at different times in the different Etruscan cities. In the south, it seems to have followed immediately on the receipt of Roman citizenship and law in 90 bce, while in the north (especially in inland cities like Chiusi and Perugia) it does not seem to have occurred before the mid first century bce, and Etruscan survived occasionally into the reign of Augustus.⁸¹⁷

II. Issues

Religion

Daniele F. Maras

18Religion

Abstract: This chapter investigates Etruscan religion by means of the evidence for cult practices, sacred architecture, and divine names and iconography, as displayed in the archaeological record.

Remarks in Latin literature about the devoutness of the Etruscans, their expertise in religious matters, and the existence of books whose contents had been revealed to them by the gods are also considered, within the context of the historical evolution of votive practices, illustrated with concrete evidence from the proto-historic age to the Roman period.

Major issues are the cult of the ancestors and heroization in private as well as public contexts; the development of anthropomorphism; transformations of the pantheon through the centuries, with the insertion of divine figures from Greek and Italic religion; the history of votive offerings and dedications as evidenced by the epigraphic sources; and cult practices, and their relationship with sacred architecture and the apparatus of cult.

Finally, there is a discussion of the integration of Etruscan religion into the Roman world, as a consequence of the insertion of local aristocracies into the Senatorial class. Particular significance is attached to divination and haruspicy, the latter of which would have been regarded as an Etruscan specialism through to late antiquity.

Keywords: Etruscan religion, Gods and pantheon, Cult practices, Worship of ancestors, Votive offerings

Introduction

The Etruscans were “a people more devoted to religion than any other, insofar as they were expert in practicing it” (Livy 5.1.6). Almost every modern account of Etruscan religion refers to this statement of Livy as a starting point, to highlight how people in Etruria took special care in dealing with religious matters and were particularly devout and respectful of the gods’ will.⁸¹⁸

Other Latin literary sources seem to confirm such an image of religious Etruscans, treating this feature of their character as the basis of a particularly Etruscan skill in divination and prophecy. We will go back to these other sources when speaking of the debt of Roman religion to Etruria. Here it is important instead to look more carefully at the cultural context of Livy’s statement, which in the past was often neglected.⁸¹⁹

The sentence is used by the historian to explain the decision of the Council of Etruria at the *Fanum Voltumnae* to refuse any help to Veii against Rome for as long as the town was under the government of a king (end of the fifth century BCE). Such a decision came after the withdrawal of artists and performers from the sacred games at the *Fanum* as a consequence of the failed

election of the king of Veii as *sacerdos Etruriae*, which was the highest position within the Etruscan federation. In such a context, Livy's statement is intended to make it clear to his readers how closely intertwined politics and religion were in Etruria.

Even more interesting, however, is the specific expression used by the historian, *gens ... ante omnes alias ... dedita religionibus*, which is evidently a partial quotation from Caesar (*B Gall.* 6.16.1): *natio est omnis Gallorum admodum dedita religionibus*, "The whole nation of the Gauls is particularly devoted to religion."⁸²⁰ The comparison throws light on Livy's method. He was starting a sort of soft polemic with Caesar on the primacy of the Etruscans in religious matters, even compared with the famous Celtic Druids, with whom they shared the ritual practice of human sacrifice.⁸²¹

From this point of view, the special devoutness of the Etruscans is even more emblematic, since it involves a general debate about the characters of peoples. However, Livy's statement appears to be linked to a specific historical event, thus highlighting a connection between religion and politics, not so different from Rome.

When talking about ancient cultures, we must avoid the common fault of applying modern categories or today's common sense to the subject. As regards our topic, it is easy to demonstrate how misleading and artificial it would be to separate religious matters from other components of everyday life in ancient times, in the Classical world as elsewhere.

In Greece as well as in Rome, political decisions, military actions, calendar dates and even events of the agricultural cycle depended upon religious prescriptions and were often introduced by divinatory or expiatory rituals. As for the Etruscans, Seneca states that "they attribute everything to god" (or better "to the gods' will," Sen. *Q nat.* 2.32.2). Thus, we can infer that in Etruria religion and everyday life were even more intertwined than in the Roman world.

It is of course inevitably misleading to treat ritual behavior in isolation from the many different aspects of the public and private life of ancient peoples in order to define the specifically religious.⁸²² In Etruria, ritual or ceremonial components can be detected in legal formulae, in the exercise of power by magistrates, in burial rites, and even in public games or shows.⁸²³

Since it is impossible here to take into consideration every facet of the archaeology of ritual and religion in Etruria, in this chapter we will focus on certain aspects of the subject, specifically relating to cult and votive practices, considering religion as a complex system of beliefs and practices governing the relationship between the human and the divine.⁸²⁴

Some parts of such a system have been dealt with in other chapters of this Handbook, such as divination and prophecy (see chapters 20 Rollinger and 21 Haack) or funerary beliefs and practices (see [chapter 19](#) Naso). Here we will deal more systematically with topics related to cult practices, sacred architecture and structures, the gods within their pantheon, viewing these

through the filter of the archaeological evidence and with the aid of the literary sources.

The *Etrusca Disciplina*

Let us begin with the so-called *Etrusca Disciplina*. As a matter of fact, within the limited number of Etruscan legends handed down to us, a special place is occupied by the spirit (*genius*) Tages and the nymph Vegoia, who both revealed the correct behavior for people in religious matters, especially regarding boundaries and the foundation of towns.⁸²⁵

In Latin literary sources, there is considerable evidence for the existence of collections of Etruscan books and texts about public and private rites, the interpretation of the will of the gods and how to avoid their wrath (see the already mentioned chapters). According to Festus (358 L.), the *Libri Rituales* prescribed what rite (Lat. *ritus*) was to be used to found towns, or to consecrate altars and temples, what inviolability (*sanctitas*) attached to walls, what law (*ius*) to gates, and how to create a division into tribes, *curiae*, *centuriae*, how to form and marshal armies, and everything else relating to war or peace.⁸²⁶ Cicero adds that there were also the *Libri Haruspicini* and *Fulgurales* (Cic. *Div.* 1.72.7), specifically related to divination, and these three collections formed the corpus of the *Disciplina*.

These and other sources could suggest that Etruscan religion was based on revelation handed down in writing,⁸²⁷ not unlike Judaism and Christianity. Nevertheless, the comparison does not look appropriate, since Etruscan *Libri* were not so all embracing as the Hebrew and Christian Bibles, nor were they at the same time a collection of laws or a collective historical memory. Moreover, in the same passage, Cicero states that the Romans had *Libri Augurales*, and we know something about the *Libri Sibyllini* and other collections of sacred rules or revealed words in the Classical world.⁸²⁸ Thus, it is better to consider Etruscan sacred literature just as part of an articulated religious and cult practice, but a more important part than similar writings in Greek and Roman religion.

Some time ago, Mario Torelli⁸²⁹ argued that the revealed nature of Etruscan ritual gave the aristocratic elites control over the special knowledge of the *Disciplina*, which had been taught by Tages to people coming from all Etruria (Cic. *Div.* 2.50), that is to say from the twelve towns of Etruria (Fest. 359.14),⁸³⁰ so becoming an instrument of power in respect of the lower classes.

Anyway, whatever the precise pattern of cause and effect may have been, the transmission of abilities and know-how from priest to priest within a few aristocratic families down to the Roman era actually helped the preservation of an aristocratic, conservative society in Etruria throughout the centuries.

What has been preserved of the *Etrusca Disciplina*, in different kinds of sources (e.g. Classical literature, archaeological finds, and iconographic and epigraphic documents), often has been considered by scholars as the genuine core of Etruscan religion.⁸³¹ In recent works, the origin of the myth of Tages has been related to finds from the early eighth century BCE⁸³² (see section 3 below). In addition, the science of haruspicy and the interpretation of bolts of lightning (Lat. *fulguriatura*) have been considered authentically Etruscan, as opposed to the Latin-Italic tradition of divination through birds (*auspicium*).⁸³³

In fact, there is evidence of Eastern elements in Etruscan haruspicy. As Adriano Maggiani has noted, the famous bronze liver from Piacenza (see below) shows a pair of signs, which are derived from the Near-Eastern (Chaldean) tradition, whose roots are Babylonian⁸³⁴ (see [chapter 20](#) Rollinger). It is difficult to determine the early phases of the development of the myth of Tages, for even in this we perhaps find traces of Greek influence,⁸³⁵ as, for example, in his name (see Gk. τάσσειν, “to arrange by order”). As for *auspicium*, there is actually some evidence of an Etruscan tradition of such a divinatory practice.⁸³⁶

Clearly it is not easy to discover the original, uninfluenced elements of Etruscan religion. One of the aims of current research is to discern and recognize external influences, highlighting what is Greek, Italic, Near Eastern or, later, Roman within archaeological and iconographic evidence, and to attempt to reconstruct the original Etruscan tradition.

From this point of view, it is evident that the influence of Greek culture in Etruria is extremely pervasive in all periods, appearing to overwhelm original or local elements,⁸³⁷ and it is often very easy and tempting to consider Etruria no more than a province of the Greek world. One should never forget, however, that such a situation depends mostly on our perception of Etruscan culture through iconographic, architectural and literary evidence, which is obviously imbued with Greek traditions.

Moreover, when interpreting the remains of ritual contexts in Etruria, it is often impossible to avoid the use of Latin sources, referring to the age of the kings or generically to early times. Such a procedure is always possible and often advisable, but one should always remember that the sources can be biased, and may offer only a very partial understanding.

In the following pages, we will go rapidly through the main phases of Etruscan religion, from time to time pointing out the available documents and the archaeological data, highlighting external elements and contributions, and analyzing some characteristic phenomena from different periods.

The origins: some remarks on the protohistoric evidence

Information about religion in the early Iron Age, until the end of the eighth century BCE, is unfortunately limited and virtually confined to funerary contexts, thus restricting our perception of beliefs and cult practices in Etruria.⁸³⁸

Such a situation depends not only on our scarce knowledge of village and proto-urban contexts, but also on the poor visibility of cult places in comparison with funerary and domestic areas. It seems unwise to infer that in early times cult occurred only within a domestic context⁸³⁹ from the lack of data on specific cult structures, since finds from the Villanovan and early Orientalizing periods, in some of the main archaic sanctuaries of Etruria, do provide some evidence of cult practices at that time, and, in some rare instances, grotto- or water-cults dating from the protohistoric period.⁸⁴⁰

Some evidence may come from hoards of bronzes too, which were common from the early Bronze Age onwards in the mid-Tyrrhenian region. Unfortunately, however, it is not easy to understand the original nature of any one deposit, which either could have been just an accumulation of wealth, or raw material recycled for blacksmiths, or, conceivably, an actual votive deposit.⁸⁴¹

An interesting example of what probably was a votive deposit in a proto-urban context has been found in Populonia at Falda della Guardiola, where under the lower layers of a Hellenistic tower attached to the city walls, archaeologists in 1926 discovered a pit containing bronze tools dating from the second half of the eighth century BCE. The finds included some axes, a sword, and a small Nuragic ship with a bull's head.⁸⁴² In this case, the coincidence of the find-spot with what in later times would have been a boundary line, has been interpreted as a piece of evidence for the sacred nature of the deposit.

Another instance of a sacred deposit, undoubtedly charged with symbolic value in the context of the exercise of power by a centralized ruling system, has been found at Tarquinia. It was discovered in a sacred and institutional complex at Civita in the urban area. Here a pit in the ground held the ritual deposition of a bronze *lituus*-trumpet, an axe and a shield, dating from the end of the eighth century BCE.⁸⁴³ These are clearly symbols of royal rank, exercised through the control of military-political power (axe and shield) and intermediation between people and gods (priesthood, symbolized by the *lituus*).

Iconographic data about the gods and religion have also been seen by scholars in some unusual representations in funerary contexts, such as the small sculptures occurring, e.g., on the lids of cinerary urns.

A pair of plastic figures on a lid from Pontecagnano, dating from the eighth century BCE (Fig. 18.1), has been interpreted as a sort of *hieros gamos* (sacred marriage) between the deceased and the goddess of the underworld, because of the freakish aspect of the figures and the slightly larger scale of the female figure.⁸⁴⁴ If such an interpretation is correct, we have a hint of how

gods were represented as monsters or half-animals and of the expectations of salvation after death by the Etruscan elites.

Much more elaborate is the representation on a bronze cinerary urn from Bisenzio, dating from the second half of the eighth century BCE: on the cover top, a bear-like monster is seated, while a group of seven ithyphallic warriors or hunters dances in a circle around it. On the shoulder of the vase, other groups and scenes encircle the mouth. We can recognize a line of nine warriors, some of them with shields, a plowman with an ox, and a man holding a mace. The last two scenes presumably allude respectively to the foundation rite of a town—which required the tracing of a boundary by means of a bronze plough⁸⁴⁵—and to the rank of a king or chief. As for the dance of the armed warriors, the monster at its center has been interpreted again as an animal representation of the god of the underworld.⁸⁴⁶

Finally, a bronze cult-wagon for burning incense from the necropolis of Bisenzio, dating from the same period, shows a complex scene, situated within a wild landscape, inhabited by animals (Fig. 10.1). Here again we find a plowman, a pair of hunters, a fight between two warriors, and a family group (father-mother-son). An armed man by the side of a taller woman bearing two vases completes the sequence. The representation seems to be a catalog of symbols of rank for a member of the aristocratic elite, alluding to foundation rites (or agriculture), hunting, war and family. In this context the woman of the final couple has been considered as a goddess, thus interpreting the scene again as either a *hieros gamos* or an initiation.⁸⁴⁷

Fig. 18.1: Cover of an ash-urn from Pontecagnano with a pair of molded human figures with freakish features, probably representing a hierogamy. Eighth century BCE. Pontecagnano, National Museum (from *Gli Etruschi fuori d'Etruria*, edited by G. Camporeale, Verona 2001)

Further occurrences of nude female figures, with emphasized sexual features, have been recognized in small statues found tombs or as *appliqués* on vases from the eighth and seventh centuries BCE.⁸⁴⁸ Most probably they were representations of a goddess of fertility, invoked in funerary contexts in order to gain salvation and blessing for the deceased. What is striking is that, almost in all of these cases, the earliest religiosity of the Etruscans was particularly addressed to female figures.

As we can see, though complex and suggestive, the information coming from these few finds is sporadic and isolated, and its interpretation is bound to remain very hypothetical, for it is based on comparison with better-known Greek and Roman sources and with anthropological observations.

A better opportunity to understand the evolution of the religion of the

Etruscans is offered by the evidence from the Orientalizing period. From this period, however, the influence of Greek culture becomes more and more pervasive, thus compelling us to identify it, and hence to differentiate the original from external elements of local cults and beliefs.

Cult of ancestors and heroization

In a culture, such as the Etruscan, known mainly through necropolises and funerary contexts, it is tempting to refer to patterns from anthropology that assign a special role to the cult of the ancestors in primitive societies. As we have seen, however, Etruscan culture can only superficially be considered “primitive.” Even if the features of its pantheon and polytheistic structure are difficult to recognize in the earlier evidence, we can infer from some data that a complex system was already in existence at least by the eighth century BCE.⁸⁴⁹

It remains the case, however, that the cult of ancestors was indeed practiced in Etruria, especially as a guarantee of the continuation of the family or aristocratic clan.⁸⁵⁰

Sculpted figures of men of rank, probably fathers or generic ancestors, appeared early on cinerary urns, especially on hut-shaped specimens. As well the antechambers and outer parts of aristocratic tombs in the seventh century BCE at times accommodated statues or reliefs representing the figures of forefathers, often with symbols of high rank⁸⁵¹ (see [chapter 19](#) Naso).

Such figures, whose presence in tombs seems understandable, were actually common in a domestic context also, where, as attested by Vergil for the palace of Latinus, they welcomed visitors into the *atrium*.⁸⁵² They symbolized the everlasting presence of the deified ancestors, who looked after their progeny during their life, especially in official or institutional contexts.

At the beginning of the sixth century BCE, the second phase of the “palace” of Murlo (prov. Siena) is characterized by a complex roof decoration, with terracotta sculptures on the top, arranged in a cycle including a series of life-size human figures, sitting or standing, with symbols of rank such as a conical hat and a *lituus* ([Fig. 71.6](#)).⁸⁵³ They were turned towards the inner court of the residential building, as though looking benignly after the living, and were accompanied by monsters, smaller in size, perhaps alluding to their seat in the underworld.

Slightly later, from the first half of the sixth century BCE, from Piazza d’Armi at Veii, is what is probably a group consisting of a statue of a man accompanied by a crouching dog, standing on the top of the roof of an aristocratic residence.⁸⁵⁴ This probable case of attention to the cult of the ancestors at Piazza d’Armi offers some confirmation for an interpretation of two huts, built above two tombs from the middle of the ninth century BCE, as

heroa of forefathers. The huts were then replaced, during the seventh century, by a small rectangular sacred building made of wood, and definitively abandoned in the middle of the sixth century.⁸⁵⁵

These monumental reflections of ancestor cult are isolated, but they imply a more widespread existence of this kind of cult, presumably carried on in family tombs, with distinctive features such as the side chamber of the “Tomba delle Cinque Sedie” (Tomb of the Five Chairs) at Caere, where statues of male and female ancestors sat before tables, in order to receive offerings by their descendants⁸⁵⁶. Less eye-catching elements, such as *cippi* and altars on top of *tumuli* and tombs, have been interpreted by archaeologists as destined to receive funerary offerings.⁸⁵⁷

These and similar objects were indispensable to the continuation of a cult practice, granting the souls of the deceased the status of gods (the so-called *di animales*, as recorded by Cornelius Labeo, quoted by Serv. *Aen.* 3.168), by means of special rituals and sacrifices.⁸⁵⁸

A possible representation of such a ritual is perhaps provided by a painting in the Tomba delle Iscrizioni at Tarquinia, on the right-hand side of the doorway, where an image of an old man, naked and with a scepter (perhaps a statue or an *eidolon*, a sort of spirit), seems to receive the offering of a fish from a young man bowing towards a small altar lying between them (Fig. 6.1). The beginning of the inscription painted on the wall above the figure reads: *ci vesana matvesi cale sece*, “Cale offered (or sim.) three *vesana* (a kind of sacrifice?) to Matve.”⁸⁵⁹

Besides the cult of the progenitors of the family, to be practiced in domestic or funerary space, we can see development during the archaic period of public forms of cult addressed to the forefathers of the community, or even its founders, of human or divine origin.

A comparison with Greece and Latium shows that cults of heroized or divine founders were common and closely connected with local tradition, but that the founders were often also open to identification with figures of classical myth.⁸⁶⁰

It is well known that in Latin Lavinium a tumulus of the Orientalizing period became the seat of a hero cult that has been recognized as that of Aeneas, as described by Dionysius of Halicarnassus (1.64.4–5). A recent study by Giovanni Colonna has proven that in the late archaic age the worship of the Trojan hero was practiced at Veii in Etruria, even more intensively than in Latium, presumably asserting a destination for Aeneas north of Rome and connecting him (and his Trojan lineage) with the foundation of the Etruscan town.⁸⁶¹

Fragments of at least two terracotta statues from the first half of the fifth century BCE have been found in the sacred area of Campetti at Veii, representing Aeneas fleeing from Troy holding his father Anchises on his shoulder (Fig. 18.2); and in the second half of the century the same subject was used for votive statuettes from sanctuaries of the town.⁸⁶²

Most probably, there was an Etruscan tradition assigning a Trojan origin to Veii, rather than to the Latins, perhaps in the context of a religious polemic with Lavinium. It is certainly not by chance that relationships between the aristocracies of the two towns have been documented by gift-inscriptions from the late Orientalizing period.⁸⁶³

From Classical literary sources we know of other legends of mythical Greek founders of Etruscan towns, such as Telemachus for Clusium (Serv. *Aen.* 10.167) or generic Achaeans for Perugia (Just. *Epit.* 20.1.11); and a few much discussed verses from Hesiod's *Theogony* (1013–1016) mention Agrios and Latinos, children of Odysseus, who reigned over the Tyrrhenians.⁸⁶⁴

In this context, an interesting report of Odysseus' last wanderings has been preserved by Theopompus (fr. 354 Jacoby) and Lycophron (*Alex.* 805 f.), who record that the hero died in Gortyna (that is to say Cortona) and was buried there on a mountain called Perge.⁸⁶⁵

Fig. 18.2: Reconstruction of a terracotta statue representing Aeneas and Anchises from Veii: in the circle the only fragment found during the excavation at Veii, Campetti (drawing: courtesy of S. Barberini, Rome)

In 1980 Colonna conjectured that the legend had been elaborated on the basis of the name of a local mountain **Perce* (today Pergo), similar to the Homeric *Pergama*, where perhaps an archaic tumulus had been considered as Odysseus' tomb and had become the location of a cult.⁸⁶⁶ Recently a signature on a bucchero aryballos from Veii dating from the end of the seventh century BCE has been read as *uthuzteths vuvze*, that is to say “*Vuvze* the Odysseid,” a descendent from Odysseus. Although it is unlikely that such a pedigree was intended to be real, it shows that elements of the legend were already forming in the late Orientalizing period.⁸⁶⁷

A truly Etruscan foundation myth was the tale of Tarchon, who was the founder of Tarquinia (carrying his name) and of the twelve towns of Etruria, but also of the other twelve in the Po Valley. The myth perhaps traveled to Campania as well.⁸⁶⁸ In short, Tarchon embodied the very origin of Etruria.⁸⁶⁹

Unfortunately, there is no clear evidence of possible cults of this hero in any of the cities of Etruria. Recently, however, Maria Bonghi Jovino has proposed to interpret a stone cist found at the Ara della Regina at Tarquinia as a cenotaph of Tarchon.⁸⁷⁰ The cist was shaped like a sarcophagus, and had a different orientation than that of the nearby temple. Further, it was later incorporated into an altar, thus confirming its sacred status.

Tarchon's tale is intertwined with the legend of Tages and the origin of the *Etrusca Disciplina* (see above).⁸⁷¹ According to Johannes Lydus (*Ost.* 2.6.B), the miraculous birth of the *genius*—an infant but with the features of an old man (Cic. *Div.* 2.50)—took place when Tarchon was plowing, which is to say tracing the boundary furrow of Tarquinia (as Romulus did at Rome).⁸⁷² The revelation of the *Disciplina* is thus linked through Tarchon to the foundation of the twelve towns (*dodekapolis*) of Etruria. Tarquinia, as place of the miraculous event, was presumably the seat of a special cult of Tages.

Evidence for this comes from a bronze statuette representing an infant rising from the ground, offered as a votive offering in a sanctuary of the urban area, which is probably again to be identified with the Ara della Regina (Fig. 18.3).⁸⁷³ The dedicatory inscription mentions the consecration of a child (... *nas* son of *Vel* and of a *Thvethli*) to the gods *Śuri* and *Selvans* (see section 4.4 below). It is attractive to suppose that the statue was intended to assimilate the young donor to the mythical *genius*.⁸⁷⁴

Tages' connection with the cult of *Śuri*—an Etruscan, chthonic version of Apollo, with oracular features⁸⁷⁵—allows us to understand the scene on an engraved mirror from Tuscania, dating from the mid fourth century BCE. Here a youth named *pava Tarchies*, dressed as a *haruspex*, reads a liver before *Avl(e) Tarchunus*, who is surely Tarchon or his son. The latter is dressed as a priest too and thrusts his stick into the ground, thus participating in the ritual.⁸⁷⁶ The scene most likely refers to the legend of Tages teaching the *Disciplina* for the first time.⁸⁷⁷

Fig. 18.3: Bronze statuette representing an infant rising from the ground, found in a sacred context in Tarquinia. Vatican Museums (after Cristofani 1985: 238, Fig. 126)

On either side of the scene, two gods attend the event: *Veltune*, the same as

Latin Vertumnus (or *Vortumnus*, *deus Etruriae princeps*, “the principal god of Etruria,” according to Varro *Ling.* 5.46.7), and *Rath*, another Etruscan version of Apollo, of whom the inscription says: “in the (sanctuary) of Rath.” It would not be too hazardous to infer that the deities represented are the most important god of the Etruscans, worshipped in Volsinii;⁸⁷⁸ and Apollo, the god of the sacred area of Tarquinia, where the myth took place and where a related cult was perhaps still performed at the time of the mirror.

Finally, the burial of an epileptic child dating from the early eighth century BCE, within the area of the sacred and institutional complex of Civita in Tarquinia (see above), has been hypothetically related by Maria Bonghi Jovino to the legend of the divine child, who spoke the revealed truth of the gods.⁸⁷⁹

The gods and the pantheon

Diverse kinds of sources, spread through the centuries from the archaic age to the Roman period, are at our disposal in order to investigate, describe and interpret the pantheon of the Etruscans.⁸⁸⁰ Still they are often contradictory. It is thus fundamental to be explicit concerning the material evidence and the research methodology we are using in dealing with the Etruscan gods and their functions and features.

In fact, on the one hand, evidence from iconographic sources such as terracotta statuettes and reliefs, vase paintings and, above all, engraved mirrors can only provide partial information about cults and religious practices, in particular because of the complexity of intertwining references to Greek myth and its symbolic values, within the context of the ritual events of daily life (such as marriage, birth, death and so on).

On the other hand, some iconographic evidence from sacred sites, as for instance architectural terracottas or anthropomorphic votive offerings, provides an image—so-to-speak a “face”—for the worshipped gods. At the same time, the nature of the votive offerings and other symbolic elements may help us to understand the type of cult that was practiced at different times.

A further and more specific kind of information comes from epigraphic sources. As a matter of fact, these provide a “name” for gods and goddesses and sometimes add less tangible data, such as the social position of the worshippers, the reasons for the offerings, references to time or place, and relationships between gods, etc.

Finally, indirect sources of information come from Latin and Greek literature dealing with Etruscan issues, providing a useful, though not always contemporary, external point of view. Moreover, this type of evidence is often unreliable due to misunderstandings or distortions.

On Etruscan religion, then, we will take into consideration here only direct

sources of information, such as epigraphy, cult images and votive offerings, using other material only in comparison with the results of analysis based on direct sources.

In fact, if we exclude the gods and deities known only from the iconographic evidence, even if their names are recorded through associated inscriptions, the Etruscan pantheon shrinks substantially. Nonetheless, when arranged in chronological order, it is possible rationally to describe the historical evolution of the pantheon across the centuries.⁸⁸¹

Seventh century BCE— Gods mentioned in inscriptions of the late Orientalizing period are few, and rarely correspond with the better known deities of later periods.⁸⁸²

A small *aryballos* with geometric painted decoration from a tomb at Marsiliana d'Albegna, dating from 630 BCE, is the earliest evidence of the cult of an underworld deity, *Vanth*, whose representations as a winged woman with bare breasts holding a torch are known in tomb paintings of the Hellenistic period.⁸⁸³ Another funerary god or goddess is probably called *flar*[---]—corresponding to *flere*, simply “divinity”—in a later inscription on an altar from the necropolis of Fosso di Arlena near Bolsena.⁸⁸⁴

Two deities of Aphrodite's retinue, called *Ithavusva* and *Achavisur*, appear in a long ritual text from the end of the century, inscribed on the foot of a bucchero calyx from Narce.⁸⁸⁵

Vena from Veii and *Vesi* from San Giovenale, who received inscribed votive offerings in sacred contexts, might be goddesses, but there is no further occurrence of these names.

Furthermore, there is no occurrence of the principal gods' names, recorded in inscriptions of the following centuries. There is, however, some indirect evidence that stems from nomenclature, since the family names *Nethuna* in Narce and *Tinnuna* in Cumae⁸⁸⁶ derive from *Nethuns* (corresponding to Gk. Poseidon and Lat. Neptunus)⁸⁸⁷ and *Tina* (or *Tinia*, Gk. Zeus, Lat. Jupiter) respectively.⁸⁸⁸

As for the iconographic material, reference to the other world as the seat of the gods, either in a funerary or in a transcendental sense, is often connected with wildness and liminality. These are represented through savage beasts and monsters, through which the deceased must pass in their last journey (as in the Campana tomb at Veii), or which surround the ancestors (as at Murlo). At the same time, the gods are represented as taming and dominating such monsters in their role of master(s) and mistress(es) of animals (“*Despotes*”~*Potnia Theron*).

The influence of Near Eastern cultures in the representation of gods—Phoenician, Cypriote and through them Egyptian—is attested by an ivory statuette of a suckling goddess from the Circolo della Fibula in Marsiliana d'Albegna, dating from the second quarter of the century,⁸⁸⁹ and some time later by the divine figures from the Tomba di Iside at Vulci.⁸⁹⁰

Sacred buildings of this period are rare. At Rusellae, within the area of the future forum, a precinct of mud bricks dating from the mid-seventh century encircled a small building of square plan with an inner circular room, probably imitating an archaic round hut (like the temple of Vesta at Rome).⁸⁹¹ We have to wait for the end of the century to find other remains of substantial structures in sacred places, as at Portonaccio in Veii, where the original huts were replaced by platforms and structures in tufa blocks, presumably connected with a temporary shrine.⁸⁹²

Sixth century BCE— From the end of the Orientalizing period, the ceremonies and formulas of the aristocratic gift-exchange system, which were already in existence in the pre-literary era, were transferred to votive offerings, providing information about gifts recorded in inscriptions.⁸⁹³ Such a system can thus be referred to as “votive gift,” and the term should be used when flagging the parallels with aristocratic gift exchange.

The standard formula in such cases was *mini mulvanice X*, “X gave me” (with some variants), and was intended to highlight the name of the giver rather than that of the receiver.⁸⁹⁴ That is why until the middle of the century, names of gods in inscriptions continue to be rare. A particular source of information is the votive deposit of the eastern altar in the sanctuary of Portonaccio at Veii, where a substantial group of inscriptions preserves the name of *Menerva*, who was worshipped there together with two other goddesses, *Turan* and *Aritimi*. In addition, another dedication from the same site records the god *Rath*.⁸⁹⁵

This short list allows us to recognize three categories of gods that are general features of the pantheon across the centuries. *Turan* and *Rath* are gods with Etruscan names, who were soon assimilated to the Greek gods Aphrodite⁸⁹⁶ and Apollo respectively (see above). *Aritimi*—the Greek goddess Artemis—keeps her name almost unaltered.⁸⁹⁷ *Menerva*,⁸⁹⁸ who had an Italic name, probably Sabine, was soon identified with the Greek Athena (although her cult is more specifically related to divination).

In the course of the sixth century⁸⁹⁹ the first category includes *Tina* (Zeus), *Cavatha* (Persephone), *Thesan* (Eos),⁹⁰⁰ *Śuri* and *Manth* (both names of Apollo as god of the dead⁹⁰¹), *Vei* (Demeter),⁹⁰² and the *Thuschva* (a group of goddesses, perhaps corresponding to Nymphs or Charites).⁹⁰³ A Greek name characterizes *Charun* (in later periods represented as a monstrous demon of the underworld with a hammer)⁹⁰⁴ and the Dioscuri (translated into Etruscan as *Tinas cliniar*, “sons of *Tina*”).⁹⁰⁵ The name of *Uni* (Hera) has an Italic origin.⁹⁰⁶

These categories of divine names are evidence for a stratified pantheon, formed on an originally Etruscan base, presumably during the period of development of proto-urban settlements in the proto-historic period.⁹⁰⁷ The involvement of people from beyond the Tiber explains the Italic components of the pantheon (and some other loanwords in sacred language). The long-

lasting contact with Greek culture from the colonial period until the Hellenistic age caused a steady insertion of Greek names and figures.

Scholars tend to attribute to Greek influence the development of the anthropomorphism of Etruscan gods,⁹⁰⁸ formerly worshipped as aniconic representation of forces of nature.⁹⁰⁹ As we have seen, however, the roots of such a process can be traced back to the protohistoric period.⁹¹⁰

The Etruscans were of course debtors to their contact with the Greeks for many features of their gods and characteristics of their cults, for most iconographic traits of divine figures, and obviously for introducing Classical mythology.⁹¹¹ In other words, the pantheon and cults of the Etruscans were developed under a continuous Greek influence, increasing through to the Roman period, while still preserving some of its original components and inner structure.

Within the pantheon a special status was attached to some gods, who kept their Greek name, adapted to the Etruscan language. This is a sign that they were imported directly from Greek religion, and found no correspondence among local gods.⁹¹²

This is the case of Artemis, but also of Herakles. The demigod, who in Etruria acquired fully divine status with the name *Hercle*,⁹¹³ is not attested by inscriptions before the fifth century BCE. Nonetheless his figure makes its appearance in architectural terracottas, votive statuettes and other representations already in the sixth century.⁹¹⁴

The introduction of the “man who would be god” accompanied a social and political evolution towards tyrannical forms of power in Etruscan cities, probably in imitation of Greece and the colonies of Magna Graecia.⁹¹⁵ Moreover, such monarchical figures were responsible for some hierogamic forms of cult, dedicated to specific goddesses as divine supporters in their bid for power.

A splendid instance of such a cult is the dedication of Temple B in the sanctuary of Pyrgi, the harbor town of Caere, dating from the last decade of the sixth century, as recorded by the three famous golden tablets with inscriptions—two Etruscan and one Phoenician. The temple and its related structures were built by Thefarie Velianas, king of Caere (according to the Phoenician text), and dedicated to the goddess *Uni*, assimilated to Astarte, who helped him to reach the throne.⁹¹⁶

Although the temple was actually dedicated to a goddess, its terracotta decoration was devoted to Herakles and his adventures up to his apotheosis, accompanied, as it seems, by Hera (Fig. 18.4), the Greek deity corresponding to Etruscan *Uni*, whose protection was sought by the king.⁹¹⁷

Fifth century BCE – Sanctuaries became the centers of religious activity, expressing the ideology of the *polis* and of its ruling class, as in the contemporary Greek world.⁹¹⁸ The focus moved definitively from the aristocratic house or palace to the temple as the main public building, destined

to be monumentalized and decorated with architectural terracottas. A consequence of this social change and urban development was a transformation in votive practices, which were no longer the expression of a family group or of a clan, but of an individual within the civic community.

The change in perspective affected the formulas of votive inscriptions, which began to highlight the names of the gods rather than that of the person making the offering. The most common verb in archaic dedications, *mulvanice*, was abandoned and replaced by the verb *turuce*, in the formula *itan turuce X Ys*, “X gave this to Y” (with variants). A simple formula of consecration, recording only the name of the god—hence an anonymous dedication—is even more frequent.⁹¹⁹

This formula began to be used in sanctuaries frequented by foreigners in harbor towns, such as Pyrgi and Gravisca, where such inscriptions are attested already in the sixth century in Greek, as well as in Etruscan. In such places a steady contact between Greek visitors and Etruscan priests (and to a certain extent with Etruscan visitors too) caused a slow evolution of cult practices and the introduction of new models and customs from Greece.⁹²⁰

Instances of this increasing Hellenization are noticeable with the inception of a cult of Herakles, worshipped with the name *Hercle* at Pyrgi and Caere (the sanctuary at Sant'Antonio),⁹²¹ but also, and even more significantly, with the introduction of initiatory cults of Dionysos (Etr. *Fufluns*)⁹²² and the Eleusinian couple, Demeter and Kore (*Vei* and *Cavatha* respectively).⁹²³

As for Dionysos, important evidence is provided by a group of four graffiti on Attic vases found at Vulci, recording a consecration to *Fufluns Pachies velclthi*, that is to say "to the Bacchic *Fufluns* at Vulci" (Fig. 18.5). Such vases, found in both urban and funerary contexts, have been interpreted as tokens or talismans for initiates to a mystery cult.⁹²⁴

In addition, Eleusinian rituals have been recognized in the sanctuary of the so-called South Area of Pyrgi, where *Cavatha*, corresponding to Persephone, was worshipped together with *Šuri*, as we have seen, a chthonic Apollo.⁹²⁵

As regards the pantheon as a whole, we have now enough material to identify the functions and features of several deities.⁹²⁶

Well-known gods with Etruscan names are *Cavatha* and *Šuri*, just mentioned, worshipped together at Pyrgi and Volsinii (Orvieto), and the former alone at Populonia and Perugia. The latter is attested with other names, again at Pyrgi (*apa*, "the Father" and *papa*, "the Grandfather"), at San Polo d'Enza in the Po Valley (*Rath*) and at Narce in the Faliscan region (*Apalu*, here for the first time with the Etruscan form of his Greek name).

We find *Turan* (Aphrodite) and *Vei* (Demeter) again at Gravisca, the latter worshipped also at Caere, Pyrgi, and San Polo d'Enza, in the Po valley; the *Thuschva*-deities in the sanctuary at Sant'Antonio in Caere;⁹²⁷ and *Tina* (Zeus) at Marzabotto, where he was god of the Great Temple in the northern part of the town, and at Volsinii, where he had local name *Velthuna* (the same as Latin Voltumna-Vertumnus). New entries in the pantheon are *Lur(š)*, a god with a heroic aspect, perhaps connected with divination;⁹²⁸ *Laran*, a military god assimilated to Ares;⁹²⁹ *Calus*, a personification of the underworld;⁹³⁰ and *Thanr*, patroness of children and birth, but with a funerary aspect too.⁹³¹

As for gods with Greek names, we have already mentioned *Hercle* (Herakles) and *Apalu* (Apollo).

Finally, gods with Italic names had important and widespread cults, and were often assimilated to major figures of the Classical pantheon, such as *Fufluns* (Dionysos), at Vulci; *Uni* (Hera), at Pyrgi; and *Klanins* (god of the river *Clanis*, today Chiana), at Quarata near Arezzo.

Fig. 18.5: Inscription *Fuflunsul Pachies Velclthi*, “To the Bacchic *Fufluns* at Vulci”, scratched under the foot of an Attic kylix, from Vulci, Doganella. Last quarter of the fifth century BCE. Florence, Archaeological Museum (photo by D. Maras)

A separate mention is appropriate for *Selvans*, the god of boundaries and the wild, with no corresponding Greek deity.⁹³² It appears that his cult was more important than the Roman *Silvanus*, in recognition of the importance of boundaries in Etruscan culture.⁹³³

Two of the longest Etruscan ritual texts date from the mid-fifth century BCE: the Capua Tile (or *tabula*), an inscribed terracotta tablet recording a religious calendar,⁹³⁴ and the lead disk of Magliano, inscribed on both faces with a complex sacred text.⁹³⁵ In both cases gods are mentioned, but beside some well-attested divine figures, local deities also appear (especially on the Tile), known only by a single occurrence. This shows that a local pantheon could be very different from the general pattern.⁹³⁶

Fourth century BCE– The formulas of votive inscriptions were enriched by additional information about the place of the offering (as we have already seen for the *Fufluns* inscriptions in the previous century), as well as about the reasons for the gift, and even by the invocation of a secondary deity, whose sanctuary hosted the offerings.⁹³⁷ Votive offerings, until the fifth century mainly consisting of pottery (often Attic vases), became more differentiated, including a large number of bronze statuettes representing mostly the donor, but sometimes also a deity.⁹³⁸

The earliest examples of *sortes*, oracular tokens, consecrated to a single god and drawn by lot in the course of a cleromantic rite, also date to this period. The gods’ names attested are *Śuri*, *Artumes*, and the obscure *Lurmita*.⁹³⁹

As regards the pantheon, the increasing number of votive inscriptions

provides a statistically significant sample, enabling us to identify the most frequently worshipped gods, and revealing some unexpected peculiarities.⁹⁴⁰ Heading the list, we find a group of different versions of Apollo, appearing as *Śuri* at Tarquinia, Vulci, Viterbo and Perugia, as *Rath* in Clusium, and as *Aplu* in some occurrences of uncertain provenance. In addition, an inscription from Pyrgi at the end of the century is a mark of increasing contact with Rome, since the god was named *Veivis*, a loanword from his Latin counterpart Veiovis.

A conspicuous group of dedications concern *Selvans*, who was widely worshipped from south to north, at Tarquinia (with *Śuri*), Bolsena, Clusium, and perhaps Cortona. *Veī* is still attested at Gravisca, but also at Norchia (as a funerary goddess within a funerary context), Rusellae and in the sanctuary of Cannicella at Volsinii, where the famous archaic statue of a nude goddess (“Venere della Cannicella”) was probably her cult image, an image quite different from that expected of a goddess assimilated to Demeter (Fig. 18.6).⁹⁴¹

Fig. 18.6: Marble statue representing a nude goddess, so-called “Venere della Cannicella”, from Orvieto, necropolis of Cannicella. End of the sixth century BCE (after Andrén 1967, pl. 3a)

Important city cults were those of *Uni*, who at Gravisca and Cortona received offerings marked with the name of the town, tallying with the information from literary sources that record Juno or Hera as the patron of cities like Veii and Perugia. By contrast, *Tina* is mentioned in just a few sporadic inscriptions from the urban area of Adria in the Po valley⁹⁴² and from a cult place in the countryside near Siena.⁹⁴³

In the neighborhood of Lake Trasimene, a sanctuary of *Cel*, a goddess of the earth like the Greek *Ge*, developed.⁹⁴⁴ Here, a group of five statuettes has been found, which were part of a set inscribed with the name of the goddess before selling them to visitors as sacred offerings. In addition, somewhere in the hinterland of Volsinii, a sacred place was created for *Vatlni*, an obscure deity who is attested by three inscriptions and is only invoked in the dedications as a host to other deities.⁹⁴⁵

Other gods recorded by votive inscriptions include *Turan* (at Gravisca and Clusium), *Artumes* (variant of *Aritimi*-Artemis), *Thanr* (at Clusium), *Lurmita* (at Vulci), *Menerva* (at Tarquinia), *Lurs* (at Corchiano), *Calus* and *Mantrns*, both gods of the dead (at Cortona), *Mariś*, a divine child bearing the name of the Latin-Italic Mars (at Clusium),⁹⁴⁶ the goddess *Pethan* (at Volsinii, Via di San Leonardo). Finally, there are occurrences of uncertain provenance of *Hercle* and *Catha* (a later counterpart of *Cavatha*, with marked solar features).⁹⁴⁷

Further information comes from the comparison of such votive evidence with the iconographic material, now available in tomb paintings and mirrors. The frequent presence of captions allows us to see some differences between the gods for whom there is evidence of cult and those for whom there is iconographic evidence.⁹⁴⁸

Figures such as *Sethlans* (Hephaistos) or *Usil* (Helios),⁹⁴⁹ often included within the pantheon by the scholars, are never mentioned in votive inscriptions, while other important gods, such as *Cavatha*/*Catha* or *Selvans* are never pictorially represented. Such a difference is particularly interesting with regard to the gods of the underworld, whose names are known from epigraphic sources as *Calus*, *Manth* (or *Mantrns*) and *Śuri* (the male figure), and *Cavatha*, *Mlach* *Thanra* and perhaps *Pethan* (the female figure). In tomb paintings, however, these deities keep their Greek names *Aita* and *Phersipnai* (respectively from Hades and Persephone) along with their Greek iconography.⁹⁵⁰

Such a situation seems to suggest that the iconographic resources used by artists in dealing with divine figures diverged substantially from the pantheon apparent in votive religion. In this regard it is certainly significant that the solar features of *Usil* and *Catha* partially overlap, the former attested only in images, the latter only in votive contexts.⁹⁵¹

Finally, *Thufłtha* was a most important goddess, whose worship is attested from the fourth century (Fig. 18.7).⁹⁵² Her identity as Tyche/Fortuna has recently been proposed, on the grounds of certain features of her cult.⁹⁵³

Attested all over Etruria, this goddess received offerings from people of all social classes (at Volsinii, from the fourth century, and at Tarquinia, Vulci, Montecchio, Mucigliano, Clusium and Montalcino in the following centuries). She was related to fate and divination.

Fig. 18.7: Bronze statuette with dedication to *aiseras Thufithcla* of uncertain provenance, probably from Volsinii. Second half of the 4th century BCE. Vatican Museums (drawing by D. Maras)

A further peculiarity of *Thufitha* is the fact that a group of gods depended on her, the so-called *aiser Thufithas* (or *Thufithica*). This expression has been hypothetically linked with what some Latin literary sources call *di complices et consentes* or *superiores et involuti* (Sen. *Q nat.* 2.41; Arn. 3.40).⁹⁵⁴ They were Jupiter's advisers on the throwing of the most terrible category of thunderbolt and were thus connected with divinatory science and the fate of human beings (see [chapter 20](#) Rollinger).

Third century BCE– In this period, we see an increasing number of inscribed bronze statuettes, especially in northern Etruria, and terracotta votive offerings, in comparison with vases, which were no longer the favorite support for votive inscriptions.

The list of worshipped gods is not very different from what we met in the fourth century:⁹⁵⁵ *Tina* and *Apollo* (as *Śuri*, *Aplu* and *Rath*), continue to be widely worshipped, as well as *Selvans* and *Thufltha*.

Local cults are known for *Hercle*, *Thuschva* and *Nethuns* at Caere, *Menerva* at Castrum Novum (Punta della Vipera, near Caere), *Vei* and *Uni* at Vulci (sanctuary of Fontanile di Legnisina), *Thanr*, *Pethan* and *Laran* at Perugia, *Lurs* at Bolsena and Cetamura del Chianti.

A new entry in the votive pantheon is *Culsans*, a two-faced god corresponding to the Latin *Janus*, with no Greek equivalent,⁹⁵⁶ whose name is related to the Etruscan word *culs*, “door,” and who probably oversaw city walls and boundaries. Supporting this notion is the fact that a pair of statuettes, representing this god and *Selvans*, was found in a pit near a city gate at Cortona (Fig. 18.8).

Other gods’ names now appearing in dedications include *Turms* (*Hermes*),⁹⁵⁷ the patron of trade, who receives the offering of a weight together with *Rath*; *Tiu*, deity of the moon⁹⁵⁸; and the obscure *Tlenasie*. Moreover, in the South Area of Pyrgi, where a process of Romanization was already at work from the end of the fourth century, there is no further occurrence of the original, Etruscan gods, such as *Śuri* and *Cavatha*. As a replacement for the latter, a group of Etruscan and Latin graffiti records a deity whose name begins with *M* (or, on one occasion, *MA*), identified by Colonna with the Roman goddess of the underworld *Mania*.⁹⁵⁹

In this period, a specific terminology to define different aspects of the sacred (*cver*, *alpan*, *tinscvil*, *nuna*) and types of deities (*ais*, *flere*, *farthan*) was developed and used in dedications.⁹⁶⁰ Moreover, names of gods are now often accompanied by epithets or adjectives, which allow us to investigate the relationship between the gods and certain features of their cult.

The documentation of “families” of gods, more evident in this period, but occasionally attested from the archaic period onwards, is especially interesting. Thus, a group of different gods is qualified as “belonging to *Calus*” (Etr. *calusna*—that is, to the underworld): they are *Tina*, *Pethan*, *Turms* and probably *Selvans* and *Menerva*. Such a series can be compared with the *aiser Thuflthas*, mentioned before, that now also include *Śuri*, as attested in a dedication from Vulci. Furthermore a circle of *Thanr* was attested already in the fifth century, with reference to *Turan* and *Mlach*.⁹⁶¹

Fig. 18.8: Bronze statuette representing *Culsans* from Cortona, Porta Ghibellina. Cortona, Museum of the Accademia Etrusca (after Cristofani 1985: 209, Fig. 104)

Clearly these “families” are not groups of minor deities moving around and helping the major, Olympic gods as attested in the Greek and Latin tradition,

and also in Etruria, for instance in relation to *Turan* (Aphrodite) and her divine helpers and servants. A specific feature of Etruscan theology is the belief that every god(ess) can participate in the sphere of his (her) colleagues, and this results in a greater importance attached to the corresponding aspects of his or her own personality. For example a funerary aspect of *Tina* (Zeus) belongs naturally to *Calus*, and when issues of fate arise *Šuri* (Apollo) takes part in the circle of *Thuflltha*.

Such a religious system is quite different from what we know in the Classical world, and is most likely a product of speculation by Etruscan priests on the basis of ancient tradition. This subject, therefore, deserves particular attention in research on Etruscan religion.

Fig. 18.9: Bronze statuette of a child holding a bird from Tuoro, near Lake Trasimene. Vatican Museums (after Cristofani 1985: 241, Fig. 127)

A further group of well-defined divine figures, associated with a specific function, includes deities who accompany the dead into the underworld and watch over the “great gate” to prevent anyone from escaping.⁹⁶² We know

much about such figures from tomb paintings and reliefs on sarcophagi, where *Charun* and *Vanth* are often represented leading the dead in the journey to the underworld (the former at times multiplied, as though there was a group of *Charun*-s). Sometimes a she-demon named *Culsu* joins them as warden of the gate. In addition, in the Tomba dell'Orco at Tarquinia a monstrous, Fury-like *Tuchulcha* is tormenting the damned.⁹⁶³

These deities had no place of commemoration in Etruria other than tombs, but sometimes received dedications in a funerary context, as we saw for *Charun* already in the sixth century and now for *Vanth* in Spina and Adria, as well as, for the group together, again at Adria, called *kulśnuter*, literally “the watch of the door.”⁹⁶⁴

Second–first centuries BCE – The last centuries of Etruscan religion are marked by the increasing Romanization of society and language, as well as of institutions and forms of cult. Therefore, it is not by chance that all the epigraphic material for this period comes from northern Etruria, since it is here that cities remained free and autonomous in their culture for longer.⁹⁶⁵

Bronze statuettes were offered to *Thufłtha* at Cortona and Montalcino and a bronze bird to *Cel* at Volterra. The local god *Tec Sanś*, worshipped at Tuoro near the northern bank of Lake Trasimene (the location of Hannibal’s victory), received magnificent votive offerings such as the famous statue of the Arringatore and a statuette of a child holding a bird (Figs. 18.9.–18.10).⁹⁶⁶

Fig. 18.10: Inscription on the statuette of fig. 18.9, incised along the right leg (drawing by D. Maras)

Apollo, both as *Aplu* and as *Śuri*, is attested on two different lots (*sortes*) from Arezzo, where his oracle was still famous in Roman time. Finally *Tina* is mentioned on a group of *cippi*, marking the boundaries of an Etrusco-Roman colony at Smindja in Tunisia.

Such cases fit the general pattern of Roman Italy, where a reference to the pre-Roman past was often a sign of conservatism or an attempt to place the actual situation in a favorable light by appealing to ancient tradition, especially relating to religion. This is certainly the case of the *cippi* from Smindja (Tunisia; see chapter 88 Naso),⁹⁶⁷ and of two stone blocks from the base of a building from Feltre, in Rhaetian territory. Here an inscription in the local alphabet records the consecration of the temple to *Tina* and perhaps *Tiu*, thus presumably referring to the Etruscans as ancestors of the Rhaeti,

according to a version also found in Livy (5.33.11).⁹⁶⁸

Very recently a long inscription, dating from the first half of the second century BCE (or shortly before) has been found on the acropolis of Populonia. It records an important dedication to a deity whose name ends with *urnz*. On the grounds of chronology, the dedication is connected probably with the founding of the sanctuary, thus again linking the use of the Etruscan language with a claim to an ancient, pre-Roman tradition.

From the same period dates the Linen Book of Zagreb (*liber linteus*),⁹⁶⁹ celebrated as the only preserved linen book from the whole of antiquity. Written in inland northern Etruria, it was preserved for us by its use as a mummy wrapping in Egypt, where it had been presumably brought by somebody (a soldier or a priest?), accompanying the Roman army under Caesar, Mark Antony or Octavian.

The book contains a religious calendar and some prescriptions for the public rituals of a community left unspecified on purpose, in order to allow the use of the book for any city (*spura enas*).⁹⁷⁰ As a matter of fact, some of the divine names occurring in the book are partly already known, such as *Tina*, *Uni* and *Nethuns*; but there are some anonymous figures too (*aiser šic šeuc* and *flere in crapšti*), probably to be determined at the time of use.

For these reasons, scholars have proposed to classify the Linen Book among the *Libri Rituales* mentioned by the ancient authors (see above). Its journey to Egypt in a Roman historical context seems to suggest that Etruscan religion survived at that point only in the traditions of families and thanks to the integration of the Etruscan aristocracies into Roman society (see below).

Beside these attempts to preserve the independence of Etruscan religion, the esteem enjoyed by the Etruscan science of haruspicy survived the disappearance of their language and even of other aspects of Etruscan culture.

One of the last great testimonies of Etruscan religious thought belongs in such a context: the famous bronze liver of Piacenza, dating from the beginning of the first century BCE.⁹⁷¹ This is a life-sized model of a sheep's liver, with the lower face divided into thirty-eight sections with divine names inscribed in them. Each section corresponds to a deity, whose will could be read in the liver of a sacrificed victim. An outer band encircled the liver showing the correspondence between the organ (microcosm) and the sixteen regions of the sky (macrocosm), inhabited by as many gods.

Most probably the liver was used as a device in teaching haruspicy (or perhaps to remind a seer of the position of each section), by a priest in the Roman army or in any case within the context of Roman Italy.

The gods mentioned on the liver partially correspond to those mentioned in votive dedications, but some important figures (such as *Menerva* or *Vei*) are missing, and others are attested only here (such as *Mae* and *Tvnth*).⁹⁷² The various names of Apollo are also missing, but the god is probably replaced by *Vetis*, derived from the Latin *Vedius* (a variant of *Veiovis*, see above).⁹⁷³

Cult practices and sacred architecture

Apart from iconographic and epigraphic sources, archaeology provides substantial information about votive religion, through the remains of ritual contexts and of sacred structures.⁹⁷⁴ It is therefore worthwhile to delve deeper into cults and their locations.

The principal ritual behavior, recognizable through archaeological finds, is the offering. Depending on time, place or motive, different kinds of offerings were possible, from libations to sacrifices, and from ritually shared consumption of food to a burnt offering (holocaust).⁹⁷⁵ The specific place for such rites was clearly an altar, which therefore was the central unit of any sacred place in ancient times, in Etruria as elsewhere.⁹⁷⁶

There were various types of altars, according to their specific function, from rude, primitive accumulations of stones or even of clods of earth to stone tables and even precious metal *trapezai*, none of which survive but which are recorded in the literary sources.⁹⁷⁷ A typically Etruscan kind of altar was pierced, used to pour liquid offerings deep into the ground, in the worship either of chthonic deities, or of the dead (Fig. 18.11).⁹⁷⁸

Offerings included animals and plants, but also drinks (primarily wine) and other foods. In such cases we find bones or remains of instruments used for rituals, especially vases.⁹⁷⁹ But there were some durable elements as well, equivalent to a sacrifice, consisting mainly of terracotta or metal figured objects or statuettes (produced for a votive purpose), and in some cases objects of daily life (transformed into votive objects).⁹⁸⁰ Votive deposits were filled with the remains of offerings and votive objects, which provide us with information on the deities worshipped.⁹⁸¹

Aspects of the environment were considered as natural points of contact between the human and the divine spheres. Through the fire of the holocaust, sacrifices ascended directly to the sky; but for blood and other liquid and solid offerings, it was appropriate to pour them into the ground or bury them, as in the case of *bothroi* and pits.⁹⁸² Similarly, pools and rivers received solid offerings for their deities.⁹⁸³

As we have seen, an important feature of Etruscan culture was the special attention paid to boundaries and divisions of space, permitting correspondences between the microcosm and macrocosm, as well as between the human and the divine.⁹⁸⁴ As a consequence, a most important aspect of a sacred place was its delimitation, often made visible by means of an enclosure (Gr. *temenos*), surrounding the sacred precinct, which marked its boundaries and was under the protection of a deity.⁹⁸⁵ There are several examples of *cippi*, inscribed with the dedication to single gods, such as *Selvans*, *Śuri*, *Laran* and *Menerva*.⁹⁸⁶

An altar surrounded by a small precinct was a specific cult unit in the Etruscan tradition. Although it evolved later into an altar on a podium, in some cases the traditional unit continued to be used until a very late period.⁹⁸⁷

Structures such as altars and precincts were liable to be monumentalized. This occurred, for instance, at the funerary altar at Grotta Porcina, near Blera, in which a round base was sculpted with a procession of quadrupeds, and surrounded by a theatre-shaped structure.⁹⁸⁸ Similarly, in its earliest layout, the grand precinct with a four-pillared entrance of Temple B at Pyrgi (Fig. 18.12)⁹⁸⁹ formed the support for the so-called building of twenty *cellae*, completed by altars in front of it, where it is thought that sacred prostitution was practiced.⁹⁹⁰

From the point of view of ritual, the house of a god or a goddess may be thought of as secondary in the organization of a sacred place. Still, already as early as the period for which documentation begins to become available, it had been developed; and in the course of the archaic period it became the focus of the sanctuary, receiving very impressive forms of monumentalization.⁹⁹¹

The earliest sacred buildings were at first huts and then shrines (*oikoi*), not very different from other kinds of structures. It is, however, possible to observe a tendency to use old-fashioned types of houses for sacred purposes,⁹⁹² such as oval and round huts after square huts had become customary; *oikoi*, when three-roomed houses had become common; and Tuscanic temples with a triple cella, after the evolution of housing complexes had long evolved away from this type of structure.⁹⁹³

Fig. 18.11: Pierced altar from Bolsena, Poggetto, with consecration to *Tina* (drawing by D. Maras)

Fig. 18.12: Pyrgi. Plan of the earliest layout of Temple B with its precinct and the building of "Venti Celle" (after Colonna 2007: 19, Fig. 2)

Clearly the evolution of sacred buildings in Etruria was not linear. During the sixth and fifth centuries BCE, to the *oikos* were added at first a *pronaos* (ante-chamber) and a *podium*, which raised it above ground level, then *alae* on both sides, columns at the front, and a rear part (*pars postica*), so achieving

the form of Tuscanic temple.⁹⁹⁴

Nevertheless, there were also cases of peripteral temples of Greek tradition (such as Temple B at Pyrgi or the Great Temple of Vulci) and mixed types or variants. In addition, other types of shrines, usually of rectangular shape, were built and used until the late period, contemporary with examples of monumental sacred architecture.⁹⁹⁵ This is especially evident in the case of some peculiar cults, such as the Eleusinian, mystery cult of *Cavatha* (Persephone) in the South Area of Pyrgi (see above) or the worship of the Greek goddesses at Gravisca, where a special provision for the cult of Adonis, of Near-Eastern origin, was included.⁹⁹⁶

The bequest of Etruscan religion

During the final centuries of their independent history, the Etruscans were more and more integrated into the Roman world, as the aristocratic families of Etruria joined the Senatorial class and their traditions became part of the *mos maiorum*.

Clearly such a process was long and largely unconscious. Its starting point is linked with the foundation of Rome itself, performed *Etrusco ritu* according to the sources (Plut. *Rom.* 11; Varro *Ling.* 5.143).⁹⁹⁷ However, in the late period we can follow the stages of this process of integration.

From the archaic period, a statue of Vertumnus, the main god of Etruria, had stood in the *vicus Tuscus*, the Etruscan quarter at the foot of Capitoline Hill. Moreover, in the collective memory of the Romans, the Capitoline Temple itself, the principal sacred building of Rome, was closely connected with the monarchy of the Tarquins.⁹⁹⁸

The Etruscans were considered responsible for anthropomorphizing the gods (Plin. *HN* 35.157)⁹⁹⁹ and, above all, for possessing a monopoly of knowledge about divination and haruspicy, as well as other sacred matters.¹⁰⁰⁰

Such faith in the capabilities of Etruscan priests soon led to a series of consultations of soothsayers from Etruria, and to their integration in religious, military and institutional roles in Roman society (see [chapter 21](#) Haack). Texts of haruspicy and divination were translated into Latin, in some cases by scholars of Etruscan origin, such as Iulius Aquila, Nigidius Figulus, Aulus Caecina and Tarquitiuss Priscus.¹⁰⁰¹

Therefore, when Livy wrote on the special devotion of the Etruscans (see above), religious matters were all that survived of the ancient Etruscan culture, preserved in family traditions and priestly doctrine. Still, Livy was speaking of ancient times, when the Etruscans were independent and preserved their customs. Now, what can we say about other Latin authors dealing with Etruscan religion?

As for Seneca (*Q nat.* 2.32.2), he refers his account of the lightning bolts

and their interpretation as divine signs to the present time, when talking of the difference between “us” (Hellenized philosophers) and the Etruscans, that is to say priests and soothsayers, who based their doctrine on ancient Etruscan tradition.

Much later, when Arnobius thundered at Etruria as the “mother of superstition” (*adv. gent.* 7.26), he was fighting against pagan religion, which, in his time, still used the Etruscan tradition as a guarantee of truth, and fidelity to the *mos maiorum*.

Still in the fifth century CE, at the end of antiquity, it was possible for Martianus Capella to find original information on Etruscan lists of gods and partitions of sky (1.45–61), and even later Johannes Lydus could translate Nigidius Figulus’ brontoscopic calendar.¹⁰⁰² Such religious material (by then only nominally Etruscan) had been handed down by priests within the Roman tradition.¹⁰⁰³

Nevertheless, the close connection with late paganism, and the consequent enmity of the early Christian Church, was fatal to such a tradition and, probably, to much of the remaining literature dealing with Etruscan matters.¹⁰⁰⁴

Christian monks handed over neither the works of learned Latin *haruspices*, nor copies of Verrius Flaccus’ *Tusci libri* and the Emperor Claudius’ *Tyrrheniká*.

Etruscan religion was doomed to sink into oblivion.

Alessandro Naso

19Death and burial

Abstract: Cemeteries are our greatest source of knowledge of the Etruscans, because the Etruscan elite furnished their tombs very richly, a “barbarian” custom that they adopted throughout their civilization, from the second half of the eighth century BCE onward. The three major arts—sculpture, architecture, and painting—were developed mostly for use in burials. Although (or because) this constitutes a huge amount of information, a detailed study of death and burial in Etruria is still lacking; the various reviews of aspects of the whole subject, usually involving a single site or a particular period in history, show that the development of a funerary ideology is closely connected to contemporary religion and society. Funerary ideology is a traditional and conservative matter. Up-to-date analyses of single sites specifically concern the Iron Age and the Orientalizing period, while the more complex Archaic and Late Archaic periods are less well known. From the Classical period onward the emergence of a precise view of the underworld can be followed, influenced by Greek conceptions of its geography: the ferryman Charon, ferrying the dead across the river Acheron to the hereafter, was adopted as *Charun* in Etruscan culture, where further male and female demons of their own peopled the underworld.

Keywords: Funerary ideology, Etruscan graves, Etruscan Underworld, orphic religion, Dionysian cult

Introduction

Cemeteries are our greatest source of knowledge of the Etruscans, because the Etruscan elite furnished their tombs very richly, a “barbarian” custom that they adopted throughout the civilization, from the second half of the eighth century BCE onward. The three major arts—sculpture, architecture, and painting—were developed mostly for use in burials. Although (or because) this constitutes a huge amount of information, a detailed study of death and burial in Etruria is still lacking; the various reviews of aspects of the whole subject, usually involving a single site or a particular period in history, show that the development of a funerary ideology is closely connected to contemporary religion and society. Funerary ideology is a traditional and conservative matter. Up-to-date analyses of single sites specifically concern the Iron Age and the Orientalizing period,¹⁰⁰⁵ while the more complex Archaic and Late Archaic periods are less well known.¹⁰⁰⁶ From the Classical period onward the emergence of a precise view of the underworld can be followed, influenced by Greek conceptions of its geography: the ferryman Charon, ferrying the dead across the river Acheron to the hereafter, was adopted as *Charun* in Etruscan culture, where further male and female

demons of their own peopled the underworld.¹⁰⁰⁷

1Funerary ideology

The development of a funerary ideology is closely connected to the contemporary society, and the custom of burying an individual is a specific cultural choice, connecting the society of the living to the community of the dead, as Bruno d'Agostino has clarified on several occasions.¹⁰⁰⁸ The furnishings are the material component of rituals and ceremonies, which otherwise often remain totally unknown. The burial and the furnishings reflect select aspects of the deceased—his or her position in the family, the society, political life, and religious life—which were highlighted by those who carried out the burial. To understand the meaning of the interments, one has to know the relevant society and its outlook, by collecting texts, rites, myths, iconography, and iconology (see [chapter 6](#) Lubtchansky). Otherwise, as is the case for societies with as few written texts as the Etruscans, one has to work with the furnishings, their composition, and their relationships.

Several cemeteries in Etruria have been explored, but Etruscan tombs have often been looted of their treasures, their contents damaged or destroyed, so that they can no longer be interpreted for this purpose. Only a few tombs have been found as they were originally sealed, and it is impossible to know whether they can be taken as a typical or random sample. Between continuity and discontinuity, the concept of an underworld as a space geographically separate from the world, which has to be reached after death, is deeply rooted in Etruscan culture. The iconography of Etruscan burial monuments often includes horses, chariots, and ships, which are clear references to the journey of the dead to the underworld.¹⁰⁰⁹

2Iron Age

Cremation, the prevalent burial custom in the Early Iron Age in Etruria, meant the physical destruction of the dead, and the collection of the remaining bones (Lat. *ossilegium*) in a cinerary urn, following a pattern already established in the *Bronzo finale*¹⁰¹⁰ (see [chapter 42](#) Trocchi). This operation extended to the remains from the pyre, which contained charcoal, ashes, and cremation detritus. Some burials have two urns—one for the deceased and one for the pyre remains. In Etruria and the areas of the Italian peninsula connected to Etruscan expansion, including Emilia Romagna, the Marches, and northern and southern Campania, the cinerary urns usually have a biconical form with two handles, one of which was often intentionally broken during a ritual for the deposition of the urn in a pit grave ([Fig. 19.1](#)). With the same purpose of

avoiding reuse of the urn, several urns have only one handle. Some details make it clear that the urns were viewed and handled as a reproduction of the human body that had been destroyed by the fire. Sometimes urns were put horizontally in *fossa* graves like a buried person; some have ornamental chains or clothing draped over them¹⁰¹¹ The urn is closed by a lid, which may be a bowl or a sort of helmet, i.e. an overturned bowl with a knob in the center. Generally, bowls were limited to female and helmets to male depositions, but it is important to note local variations site by site.

By analyzing the remains of bones from the cineraria found in the Early Iron Age cemetery of Villa Bruschi Falgari at Tarquinia, which has recently been explored, and comparing them with the archaeological finds, Flavia Trucco was able to distinguish differing customs for the cremations of children/young people versus adults by differences in the placement of the bowl used as a lid. For younger people, the bowl is small and placed right side up, to hold remains of the pyre and food offerings such as meat or fruit. For men and women, the bowl is larger and placed upside down. There are some interesting exceptions: in some cineraria containing adult male cremations, the bowls face up, as in children's graves. Did these men, treated like children in death, have a low social position? This is a possibility.¹⁰¹² In some cases in the same cemetery, the remaining bones were probably washed and placed in the urn wrapped in a cloth, as documented by the decorations that survive, such as sheet bronze ornaments stitched to the cloth, or fibula used to fasten it. The clay helmets may have on their knob an exact reproduction of a hut roof, a custom already documented in the *Bronzo Finale* in central Italy both in Etruria and in Latium Vetus.¹⁰¹³ This connection with the dwelling is repeated by the rare cinerary urns in shape of a hut, which were used occasionally in Etruria and often in Latium Vetus from the *Bronzo Finale* onward.¹⁰¹⁴ Some burials belonging to the last decades of the Iron Age, in the third quarter of the eighth century, already show some of the main characteristics of the subsequent Orientalizing period. These include luxury goods, which were directly imported from the Levant or Greece, or locally made but inspired by imports, and are identified in rich male and female burials in Tarquinia and Capua.¹⁰¹⁵

Fig. 19.1: Villanovan graves from Tarquinia

3Orientalizing period

The shift from the Iron Age to the Orientalizing period was marked both by continuity and discontinuity. Inhumation burial is now the most common funerary practice, but new forms of interments were introduced, including chamber tombs contained in huge tumuli. Some tumuli were used by the same family for several generations, but originally a tumulus was built for the burial of a single person. This practice can be closely connected to the cult of this person as ancestor (see [chapter 48](#) Trocchi and [Section 7](#), below). Huge tumuli, clearly inspired by Near Eastern models in Syria and Phrygia, created a new funerary landscape in Etruria, whether located in cemeteries around the cities or isolated in the countryside, with the function of marking land ownership by the elite.¹⁰¹⁶ In Etruria the tumulus developed as a new space intended for funerary cults. Friedhelm Prayon notes, for instance, that in southern Etruria the entrance doors and the corridors of chamber tombs dating to the seventh century are often oriented in a northwest–southeast direction: this corresponds to the Etruscan conception of heaven, known from late

descriptions by Roman authors, whose northwestern portion housed the gods of the underworld (Figs. 19.2.–19.3).¹⁰¹⁷ The orientation of the Orientalizing chamber tombs seems to confirm that the idea of an underworld is an old tradition with deep roots in Etruscan culture, and the conservative character of Etruscan funerary culture begins to emerge. Pursuing the tendency already begun in the Iron Age, there is an effort to reproduce the body of the deceased in the burials. For instance, in interments in Vulci and Marsiliana, which date to the first half of the seventh century, some sheet-bronze busts consisting of a sphere for the head, a cylinder for the neck, and two conical elements for the arms, imitate the shape of a human body in geometric form.¹⁰¹⁸ In the same period, in Chiusi and the surrounding territory canopic urns with masks that reproduced human faces came into use.¹⁰¹⁹ The iconography of seventh-century burial monuments shows the journey of the dead to the underworld: horses, as in the wall painting of the Campana Tomb in Veii; two wheeled chariots, as in the Zannoni stela in Bologna; and ships, as in the vase painting on the jug from Tragliatella, are clear references to the modes of travel.¹⁰²⁰

The locations of cemeteries usually changed in the Orientalizing period. The areas reserved for cemeteries are usually around the cities or the settled land, following a pattern already established in the Iron Age. In most cases, however, the general topography of the cemeteries was deeply modified from the Orientalizing period onward, as shown by Caere in southern Etruria and Pontecagnano in southern Campania. In both cases, the Iron Age cemeteries—Sorbo at Caere and ECI at Pontecagnano—were partly or totally abandoned and new areas designated for burials, and they were used as cemeteries for many centuries: the Banditaccia at Caere and the Second Western cemetery at Pontecagnano.¹⁰²¹

The lifestyle of the Etruscan elite and the composition of tomb goods were dramatically changed by the luxury items imported from Near Eastern regions to Etruria. Bronze cauldrons from northern Syria, silver ribbed bowls sometimes plated with gold, silver or bronze jugs from both Cyprus and the Levant, and Phoenician or Syrian glass bowls delighted the Etruscan elite, who placed them as furnishings in burials at several cities, including Vetulonia, Marsiliana, Caere, and Pontecagnano. Some imports were adjusted for sepulchral purposes, as is shown for instance by the snake heads on the—likely—Cypriot silver cauldron plated with gold from the Bernardini Tomb in Praeneste.¹⁰²²

Fig. 19.2: Tumuli with several chamber tombs in the necropolis of Caere: the oldest tomb is always oriented northwest (after Prayon 1975, pl. 82)

Two warrior burials from Pontecagnano in southern Campania, dating to the second quarter of the seventh century, are particularly important, because they were found intact. *Fossa* graves 926 and 928 have similar plans. Both are bordered by stone slabs, and both include a recess in the ground containing

bronze cauldrons; in both recesses one cauldron was used as a funerary urn (Figs. 19.4.–19.5). The cauldrons were probably wrapped in cloth fastened with silver fibulae. Precious silver and bronze jugs and bowls were found in the recesses. In the *fossa* lay iron tools like spearheads, axes, spits, and andirons, as well as animal bones and clay vases of various origins. In both graves, the difference is clear between objects relating to the sacrifice, including tools and portions of animal flesh, placed in the *fossa*, and the most valuable items, which belonged to the deceased warriors and which were concentrated in the niche with the bones. Bruno d'Agostino compares both niches to the *thamos*, a room in ancient Greek houses that contained the most valuable possessions (Gk. *agalmata*) of the hero, revealing his social status (Gk. *ktemata*). In both graves, the adoption of the cremation ritual, reserved in Homeric Greece for heroes, has been seen as a Greek influence; on the other hand, at Pontecagnano inhumation predominated.¹⁰²³

Fig. 19.3: Etruscan conception of the heaven

Fig. 19.5: Plan of grave 928 at Pontecagnano (after d'Agostino 1977, fig. 13)

The two categories of items that are so clearly distinguished in the two warrior graves at Pontecagnano—the personal property of the dead and the

objects used in the funeral—are distinguished in most Etruscan interments. A third category is evident, too: objects belonging to the tomb furnishings that were not personal property or related to the cult. As is usual for funerary practices, which were very conservative, the use of three categories of funerary furnishings continued throughout Etruscan civilization.

In the well-known Regolini-Galassi Tomb at Caere, dating to the second quarter of the seventh century, the furnishings were displayed in spaces comparable in function to the two graves of Pontecagnano and included all three categories. This tufa-block tomb, consisting of one long corridor and two small side chambers, held two deceased persons, a woman buried with an exceptional *parure* of gold jewelry in the corridor, and a man whose bones were placed in an urn in the right chamber. A buried woman and a cremated man in the same interment are widely attested in Orientalizing Etruria.¹⁰²⁴ The high status of the female, probably a queen (see [chapter 47](#) Naso), is further emphasized by bronze items, including eight shields, some of them still hanging on the walls, which were placed in the innermost part of the chamber, corresponding to the *thalamos*. The front portion of the corridor held bronze objects belonging to the cultic sphere, which include not only a ritual cart, cauldrons with their related stands, spits, and andirons, but also a bed and a four-wheeled wagon. The bed and wagon were used respectively for viewing the body at home (Gk. *prothesis*) and bringing it to the tomb (Gk. *ekphora*). In the tomb, about forty bucchero statuettes of women were placed around the bed, to recall the women weeping for the dead during the funeral (Lat. *praeficae*). The left side chamber was devoted to the sumptuous life of the queen, containing, among other things, a silver wine service, including twelve bowls of various forms, a little amphora, and two jugs. Some of these vessels, used for drinking wine mixed with water, bear the same Etruscan inscription, *mi larthia*, “I am (property) of Larth.” Since Larth is a male personal name, the wine service was a gift from Larth to the deceased woman, probably his daughter or wife. Additional metal vases, including twelve ribbed bowls, one of silver and eleven bronze, still hung on the walls of that chamber.¹⁰²⁵

Near the exceptionally rich tombs just mentioned, several interments, dating from the second half of the seventh century onward, have a great quantity of clay vases instead of metal furnishings. Like the metal vessels, the clay vases were imported from Greek manufacturing centers such as Corinth, East Greece, Sparta, and Athens, or produced in Etruria. The vases produced in Etruria include coarse ware (It. *impasto*), several types of painted pottery, and bucchero. The various vases were arranged in sets, each one with a specific function. It has been noted that *impasto* services, including plates, were mostly intended for food, while bucchero, in a large variety of jugs and chalices, was mostly used for drinking wine.¹⁰²⁶ Trade amphorae imported from several Greek cities, including Corinth, Athens, Chios, and Samos, have been found in Etruscan tombs from the first half of the seventh century

onward. The amphorae, developed mostly for trading wine and oil, found their final use in funeral contexts as wine containers. This hypothesis needs to be confirmed by analysis of the organic remains in the amphorae.¹⁰²⁷ From the Orientalizing period onward, the custom spread of placing a variety of food (meat, fish, eggs, fruit) in the tombs as offerings to the dead (Ger. *Totenmahl*). The chamber tombs were conducive to good preservation of organic remains, which improves our knowledge not only of funerary ideology, but also of agriculture.¹⁰²⁸

4Archaic and Classical periods

Around the year 580, the development of the city as an institution and changes in Etruscan society are reflected in the interments. The elite, now more numerous, invested the surplus not only in funerary accommodations, but also in the construction of sanctuaries and public structures. The newly established settlement pattern included an increasing occupation of the countryside in order to produce more food. City and countryside must now be distinguished in every aspect of Etruscan civilization. From the early sixth century onward, the historical development of Etruscan civilization reveals the major importance achieved by individual cities and great districts, each one having its own characteristics. For instance, the custom of putting stone stelae and markers (Gk. *semata*) outside tombs spread all over Etruria, but the forms exhibit considerable local variation (see [Section 8](#) below). This detail and the absence of specific research on the subject make it difficult to follow general lines of development throughout Etruria. As influence grew from both Athens and Rome, where sumptuary laws against the high cost of burials were promulgated, in Etruscan Veii and its countryside only a few objects were entrusted to the tombs.¹⁰²⁹

The deceased could be buried, as was usual in southern Etruria, or cremated, as was usual in northern Etruria,¹⁰³⁰ but there are many exceptions. Cremations in Attic and Etruscan figured vases are known in southern Etruria during the sixth and fifth centuries, as earlier. In Tarquinia, cremation is not limited to a single age, given that the cremated persons are identified as youths, most not more than twenty years of age, or as people older than sixty, but the age of the deceased is not always clear.¹⁰³¹ The existence of familial traditions—at least for the elite—is assumed, possibly followed for several centuries.

In Campania there was a long tradition of cremation as a funerary ritual: the oldest interment at Cumae dates to the end of the eighth century and shows Euboean influence. Regarding the seventh century, we reviewed the graves at Pontecagnano in [section 3](#) above. During the sixth century, both male and female aristocrats in Capua were cremated in rich tombs, such as the

Quattordici Ponti Tomb, in the specific form of the cube tomb. In the Late Archaic (510–470 BCE), local Capuan aristocrats adopted distinctive bronze urns as containers for the ashes (Fig. 74.8). The lids of these urns are decorated with human statuettes reproducing subjects related to the ideals of the aristocracy such as athletic games.¹⁰³² The images painted on the Attic red-figured *stamnoi*, which were probably used in Capua as cinerary urns in the fifth century, reproduce Dionysian motifs and death scenes, which clarify the funerary ideology of the Capuan elite.¹⁰³³

The painted tombs of Tarquinia, which from 530 onward show various moments of the funeral rituals, have a special role in our understanding of funerary rituals. Some tombs reproduce the structure of wood and textile tents, in which the viewing (Gk. *prothesis*) of the deceased took place. The scenes painted on the walls of these small chamber tombs reproduce several activities, such as symposia and athletic games that took place during the funerals and that included fighters, boxers, and two-wheeled chariot races. Stressing the function of the tomb as the place of transition between life and death, Mario Torelli argues that the games belonged to the living, while the symposia belonged to the dead.¹⁰³⁴ Francesco Roncalli notes that in the painted tombs at Tarquinia the usual absence of decoration on the side walls closest to the entrance door, versus the presence of paintings in the interior part of the chambers. This was reserved for the deposition true and proper, as we have seen in older tombs such as the Regolini-Galassi Tomb at Caere.¹⁰³⁵ It may also be added that from the fourth century onward, the Etruscans used the term *cela* (Lat. *cella*) for the interior chamber, which was the funerary one.¹⁰³⁶

The furnishings of this period show new forms, but the same functions already noted in the Orientalizing period.¹⁰³⁷ Specific investigation has been carried out on Attic vases found in Etruscan cemeteries,¹⁰³⁸ cities and settlements,¹⁰³⁹ and sanctuaries,¹⁰⁴⁰ producing an impressive amount of information. The choice of the subjects painted on Attic vases for Etruscan customers' tombs to form more or less homogeneous sets has not yet been the object of systematic research, probably because of the huge quantity of pottery. Single cases, such as the Brygos Tomb at Capua and Tomb 128 in Valle Trebba at Spina, show how careful and consistent such selection could be.¹⁰⁴¹ From the second quarter of the fifth century onward, the Attic red-figured vases show a growing number of scenes derived from the imagery of Dionysios, the Greek god of wine. The ceramics from Bologna and Spina show the high popularity of this Greek divinity in Etruria, probably because of the eschatological teachings of the Dionysiac cult.¹⁰⁴² The provenance from these cities of such important evidence regarding the Greek cults is no accident. From the fifth century onward, the role of the Etruscan cities of the Po Valley increases in the general development of Etruscan funerary culture, because Greek commerce was localized in the Adriatic ports, and that brought the possibility of contact with new ideas.¹⁰⁴³

5Late Classical and Hellenistic periods

The ships painted around the middle of the fifth century on the walls of the Tomb of the Ship at Tarquinia show that the journey to the underworld was thought to be by sea.¹⁰⁴⁴ This is confirmed by other painted tombs in Tarquinia, such as the tomb of the Blue Demons, which dates to the second half of the fifth century. Francesco Roncalli notes that the paintings in this tomb mark the shift to a new age, because for the first time a precise view of the underworld can be seen, which is influenced by Greek ideas about its geography. The Greek ferryman Charon (Etr. *Charun*), ferrying the dead across the river Acheron to the hereafter, was adopted in Etruria, where male and female demons of their own populated the underworld. In the Tomb of the Blue Demons, two horrible male demons are seated on a large rock on a side wall near the entrance door. They are in sharp contrast with the opposite side wall, which is dominated by the quiet scene of musicians playing for the symposium depicted on the chamber's front wall. The position of the demons near the entrance door marks the access to the underworld and shows how terrible the hereafter was thought to be. The rock is the symbol of the death in other fifth- and fourth-century Etruscan artifacts as well, as Roncalli originally pointed out.¹⁰⁴⁵ Other scholars interpret the paintings of the Tomb of the Blue Demons differently.¹⁰⁴⁶ Direct influence of Greek funerary ideology, particularly the Orphic doctrine further developed by Pythagoras of Samos (ca. 570–495) when the philosopher moved to southern Italy, is visible in the wall paintings of the Tomb of the Orcus II at Tarquinia, which dates to the end of the fourth century. The small human figures are the *animulae* of Orphic religion; the souls in the underworld are looking for safety or their metempsychosis (Fig. 19.6).¹⁰⁴⁷

During the fourth century, the use of stone coffins or sarcophagi to contain single burials and related furnishings increased in the chamber tombs.¹⁰⁴⁸ The sarcophagus of the founder of the family and of the tomb (Lat. *pater familias*) was emphasized through its central position in the chamber and often through an inscription. The friezes sculpted or—rarely—painted on the long sides of the chest reproduce scenes inspired by the daily life of the dead, adapted to the funerary destination by the insertion of demons or other details of the underworld. A constant reference to an underworld is seen in the presence of sea creatures, both real, like dolphins, or fantastic, like seahorses and sirens. They always function as an allusion to the body of water that needed to be crossed to reach the hereafter.¹⁰⁴⁹

6Late Hellenistic and Republican periods

From the second half of the fourth century, and with particular intensity

during the third and second centuries, Etruscan handicrafts were characterized by a degree of standardization, which is visible in the stone reliefs as well as in the pottery and bronze work.¹⁰⁵⁰ This tendency was particularly strong in southern Etruria after the years of the Second Punic War (or Hannibal's War, 218–202) and emerged later in northern Etruria (see [chapter 64](#) de Angelis). In both districts it is reflected in the repetitive composition of the funerary furnishings, which still include several types of clay vases, usually grouped in drinking and eating services. Regarding funerary ideology, two phenomena emerged in this period. The first is the presence of low-value coins in the grave goods, following a practice long documented in Greece and Italy. The coins in the interments have traditionally been interpreted as Charon's obol—the fare for transport to the underworld—but this simplistic statement needs to be verified. It should be compared with important information, such as the position of the coin in the burial, the rank, sex, and age of the deceased, and so on, as has recently been stressed by Renata Cantilena for ancient Campania.¹⁰⁵¹ The situation in Etruria is not clear, because specific research has yet to be done.

Fig. 19.6: Tarquinia, Tomb of the Orcus II: Agamemnon and Tiresias in the Netherworld; on the tree, *animulae* (after Steingraber 2006, 189)

The second new phenomenon is the widespread adoption of Greek myths focusing on death. The friezes on the cinerary urns adopted in several cities in

northern Etruria offer a wide selection of Greek myths relating to the death of legendary figures, as celebrated in the Greek tragedies devoted to the Homeric and Theban cycles (Fig. 19.7).¹⁰⁵² The probable aim is the self-identification of the Etruscan deceased with these heroes. The characteristic standardization of Etruscan handicrafts in this period forbids us to compare the repetitive friezes of the urns with the few exceptional cases that pursued this aim in earlier centuries. Around 490, the suicide of Croesus on the pyre has been reproduced on an Attic red-figured amphora from Vulci painted by Myson in Athens. This is the only depiction of the myth and was probably painted in Athens as a special commission intended for the ashes of a sophisticated Etruscan gentleman.¹⁰⁵³ The friezes on the urns include Etruscan demons, which may be inspired by Greek culture, such as the ferryman Charun, or Etruscan culture, such as the female Vanth (with torch and scrolls), the female Culsu, and the male Tuchulcha. Such demons, which are more or less horrible, were not necessarily an invention of this period, but were reproduced during this period with special frequency.¹⁰⁵⁴

Fig. 19.7: Cinerary urn from Chiusi with Orestes killing his mother Clytaemnestra

7Cults in Etruscan cemeteries

The remains of buildings consisting of foundation walls, altars, and architectural terra-cotta that were originally part of roof decorations have been found in several Etruscan cemeteries, and prove the existence of structures presumably reserved for burial cults, at least from the Archaic period onward. A well-known case is the building identified on top of Tumulo II del Sodo near Cortona.¹⁰⁵⁵ Although inscriptions are still lacking, the ancestor cult, which is documented in many ancient societies, has also been observed in Etruria.¹⁰⁵⁶ A particular case has been explored at Populonia in the cemetery on the Gulf of Baratti, where about 250 pieces of spearheads and spear-butts have been found near a small stone tumulus (diam. 5 m), in which interments have not been found. One can imagine that the spears marked the presence of the stone monument, which dates to the late seventh century and was worshiped in the following centuries.¹⁰⁵⁷

8Statues, stelae, and *semata*

According to Etruscan ritual, stone and probably wooden artifacts of various forms were placed in cemeteries as markers (Gk. *semata*) near the tombs, particularly on top of the mounds, if there were any, and in front of the entrance doors.¹⁰⁵⁸ The form of the artifacts relates strictly to their function. At least from the late Orientalizing period onward, statues of animals such as lions or fantastic creatures like sphinxes were adopted to mark the imaginary border of the afterworld on the ground.¹⁰⁵⁹ Stelae otherwise emphasized the position or the entrance of the tomb. In the Late Orientalizing period, stone pillars with figured decoration in bas-relief were introduced in the cemeteries of Vulci, where in the Archaic period some workshops producing lion and sphinx statues have been identified.¹⁰⁶⁰ The great local variability of tomb markers in the various cities of Etruria must be stressed. Stelae were introduced at Bologna already in the seventh century,¹⁰⁶¹ and they flourished in several forms, particularly from the late sixth to the early fourth century.¹⁰⁶² Stelae are particularly widespread in northern Etruria. Single items dating to the late seventh century have been found at Vetulonia¹⁰⁶³ and Monte Gualandro near Perugia,¹⁰⁶⁴ and dating to the sixth century at San Casciano.¹⁰⁶⁵ In the sixth century, local workshops flourished because each city had its own form, as was usually the case in Etruria: several items are known at Faesulae,¹⁰⁶⁶ Volterra,¹⁰⁶⁷ Populonia,¹⁰⁶⁸ and Rosellae.¹⁰⁶⁹

In southern Etruria, several forms of stone *cippi* were exclusive to female and male burials, following local variants. Regarding female burials, *cippi* reproducing houses and recalling burial ideology were especially widespread. Although one example in the form of a hut roof from the cemetery of Poggio Selciatello di Sopra at Tarquinia dates to the Iron Age, such *cippi* are particularly widespread at Caere and its surroundings in the late seventh to the sixth century and again from the fourth century onward.¹⁰⁷⁰ Three warrior-head *cippi* have been found in male graves of the second half of the sixth century at Orvieto, which have been interpreted not only as funerary markers, but also as signs of resurrection.¹⁰⁷¹ Marble *cippi* in the form of a club, although of earlier origin, were popular during the fifth century in northern Etruria, especially in the Pisa and Volterra districts, where other forms developed.¹⁰⁷² From the fourth century onward, *cippi* of cylindrical form were used at Caere to mark male depositions. The exemplars found at Aleria in Corsica and at Carthage in North Africa can be connected with people from Caere and are considered signs of geographic mobility.¹⁰⁷³

Robert Rollinger

20Haruspicy from the Ancient Near East to Etruria

Abstract: The paper deals with the cultural technique of divination, its development in the Ancient Near East and the possible influence of this craft on the Etruscan diviners and augurs. It presents the major characteristics of the different divination techniques starting with their documentation at the beginning of the second millennium BCE and reaching as far as the last centuries of the first millennium BCE. It shows that divination was a highly professionalized and specialized discipline with a scientific spirit where not only the communication with the gods but also writing and the interpretation of divine signs were looming large. In the course of centuries a vast array of companions and manuals, commentaries and excerpts has been created. The diviners were distinct by their education and were regarded to dispose of secret knowledge. Haruspicy (extispicy) played a major role in this context. The paper discusses the hermeneutics and techniques of the discipline and puts the craft into an intercultural context.

Keywords: Haruspicy, extispicy, divination, intercultural exchange, secret knowledge

Introduction

Although intercultural contacts between the Ancient Near East and the cultures further to the west have become a common and fairly popular topic in the last decades, the issue of divination does not seem to play a prominent role in this context. About half a century ago, the situation was quite different. Whereas in general scepticism was prevailing concerning cultural exchange between the Levantine and the more Western Mediterranean cultures, it was exactly divination where doubts about these contacts were far less dominant. This may be due to the fact that, in this case, the main focus was not on “oriental” and Aegean contacts but on Levantine – Etruscan ones. From the beginning haruspicy¹⁰⁷⁴ loomed large in these discussions. In two independent seminal studies Jean Nougayrol and Giuseppe Furlani respectively, were collecting and discussing the evidence concerning the relationship between Etruscan and Mesopotamian forms of divination in general and haruspicy in special.¹⁰⁷⁵ The bronze liver of Piacenza and the clay liver from Falerii Veteres have been main points of reference in this discussion. Since these two Etruscan liver models are the only exemplars so far testified outside the Near East where such models are attested broadly from the beginning of the second millennium B.C.E., this was a strong argument in favour of Assyro-Babylonian extispicy influencing Etruscan

hepatoscopy. Furthermore, applications and marks on the clay liver of Falerii Veteres which bears no inscriptions have been interpreted as corresponding to similar elements on Near Eastern liver models. Moreover, the division of the bronze liver of Piacenza into different sections has been regarded as coinciding with Babylonian conceptions.¹⁰⁷⁶ Yet, the conviction of a direct Near-Eastern influence has become weaker in more recent years.¹⁰⁷⁷ And indeed, there are clear differences between the Etruscan and Babylonian liver models. The inscriptions on the bronze liver indicate Etruscan and Italic deities and elements. What is more, queries and prayers connected with Etruscan extispicy were not directed to one specific deity. Thus, the prominent role played by the Mesopotamian sun god Šamaš and the storm god Adad has no counterpart in the Etruscan discipline where the reading of the entrails could be performed in the service of any deity. But a closer look on modern studies in intercultural contacts exhibits, that such differences by no way disprove possible contacts between East and West. Cultural borrowings are always embedded into new contexts and adapted to new structures.¹⁰⁷⁸ This already becomes evident when we look at the Ancient Near East as such, which was far from being a homogenous cultural zone.¹⁰⁷⁹ Divination techniques spread from Mesopotamia proper to neighbouring regions such as Anatolia, Syria-Palestine and Iran where they were reshaped, modified and “reinvented”. A good example for this development is the Hittite omens of the second millennium BCE. Although omen compendia have been imported from Babylonia and translated into Hittite, the general conception concerning the function of these omina was a different one. Whereas for the Hittites omina were an expression of divine dismay over the past, for the Babylonians they were far more a media to deal with the imponderabilities of the future.¹⁰⁸⁰ Taking into consideration these general criteria of intercultural borrowings and contacts there are three major arguments in favour of an ancient Near Eastern influence on Etruscan divination.

- a) The chronological and historical framework: The development of Etruscan culture coincides with the evolution of a Mediterranean network where ideas, commodities and cultural techniques were exchanged in all directions.¹⁰⁸¹
- b) The cultural context: Etruscan religion in general clearly shows traces of intercultural contacts with the world of the Ancient Near East.¹⁰⁸² Contacts, in which form ever, did exist as a bronze vessel fragment with a cuneiform inscription in an Etruscan tomb demonstrates.¹⁰⁸³
- c) Divination as a standardized and distinguished cultural technique: It is not only extispicy but divination in general where substantial similarities in conception and performance, structure and organization can be observed.

1 Ancient Near Eastern Liver Models

Our major concern here is these similarities.¹⁰⁸⁴ The liver models are a convenient starting point for the discussion of the topic. It has already been stressed that beyond the Ancient Near East models of sheep liver have only been unearthed in Etruria. All these models, including the Etruscan ones, are similar in shape and share characteristic features. This is not only true because of the innate anatomical appearance of a sheep's liver. These features affect those parts of the liver which are seminal for the hepatoscopy. What is more, all these models represent sheep livers which were the basic working objects for the diviners.¹⁰⁸⁵ It is true that the details on the liver models themselves exhibit distinctive differences but this touches upon the different functions these models had to meet. These functions were highly diversified as the Ancient Near Eastern exemplars show.

The oldest Ancient Near Eastern specimens hark back to the 19th cent. BCE, the youngest ones to the 8th century. Although the two Etruscan exemplars are even later, i.e. third cent. BCE, this is not a real gap. Extispicy is very well attested in the Ancient Near East until the very end of cuneiform culture, i.e. until Seleucid-Parthian times (third cent. BCE to first cent. CE). And the Etruscans did not invent divination from the scratch in the third cent. BCE.

The Ancient Near Eastern models do not only originate from Mesopotamia proper. To the contrary it can be observed that divination techniques spread from this core area to the adjacent regions of Anatolia, Syria-Palestine and Iran. The models preserved are fairly distinctive concerning details and marks.¹⁰⁸⁶ Some bear inscriptions, others do not. The reason for this is based on their different assignment and function. Some have been used as teaching aid to instruct apprentice diviners. These specimens do not represent the results of one single extispicy but collect all the information relevant to introduce young diviners into their future discipline. This is also true for those exemplars which were used as compendia collecting the essentials of a diviner's knowledge. Other pieces do represent the outcome of one single extispicy-performance which was regarded as being of major importance. It is important that some regions, like e.g. Syria-Palestine, exhibit distinctive developments, as the liver models from Hāṣōr demonstrate.¹⁰⁸⁷ These differences do not disprove the Mesopotamian origin of these models but show local adaptations and a combination of regional specifics with foreign impulses.

2Ancient Near Eastern divination disciplines

Focussing on Ancient Near Eastern divination in general, it becomes immediately clear that all disciplines, including the Etruscan practice, share characteristic features. Extispicy is one of a plenty of divination techniques in

the Ancient Near East. These techniques are very well attested not only by archaeological sources like the liver models just introduced but by hundreds and thousands of cuneiform texts. Although the origins of many of these techniques may go back to prehistoric times the bulk of our documentation starts with the beginning of the second millennium BCE. During this time, i.e. in the 19th and 18th cent. BCE a stream of tradition becomes visible which shows an astonishing homogeneity over the centuries and which is documented until the very end of cuneiform culture in Seleucid and Parthian times. The divination techniques can be divided into two major groups.

The first group represents those omnia which were sent unprovoked by the gods. The physical surroundings and common occurrences of daily life like the behaviour of animals, the conditions of weather and climate, the physiognomy and conduct of human beings, dreams, as well as abnormalities in physical developments were of major importance in this context. Prophecy loomed large¹⁰⁸⁸ and the vast field of astronomy and astrology was highly relevant although major developments in this discipline did not start before the first millennium BCE.¹⁰⁸⁹

The second group unites those omnia which could, at least theoretically, be provoked by experts at any time and place. Important techniques in this field were aleuromancy, where flour was poured out in small heaps and the diviner interpreted shape and orientation as well as lecanomancy, where oil and water were combined and the diviner interpreted the evolving patterns. Yet the most important technique in this context, at least as our documentation is concerned, was extispicy.

Some techniques could combine characteristic features of both groups. This is true, for instance, for the observations of the flight of birds which could be inductive and non-inductive as well.¹⁰⁹⁰

3World View and Writing

All these forms of divination were based upon a specific world view. From the beginning of creation, there was a well established and abiding world order with permanent structures and rules. The gods communicated with human beings by intermediaries, i.e. prophets, or by signs. These signs could not be deciphered by anybody but experts whose knowledge and skills were based upon an intensive and time consuming training. The gods could send these signs at any time they wanted or as a reply upon ritualized queries. The signs were regarded to be a form of script thus showing the fundamental connection between writing and divination.¹⁰⁹¹ Thus, the liver as well as the starry sky was conceived as the “tablet of gods” where the “heavenly writing” could be observed and decoded. A text of the first millennium BCE puts this crucial conception into perspective: “You (the sun god Šamaš) write upon the flesh

inside the sheep (i.e. the entrails), you establish (there) an oracular decision”.¹⁰⁹²

The diviner could read these signs, interpret them and derive meaning. The world was full of signs and these signs, or better the divine messages transported by them, were connected with real phenomena and events of any kind in the near future. Thus, the imponderabilities of human life could be mastered by observing the natural environment meticulously and by decoding the divine messages. Yet, the ancient Mesopotamians did not indulge in any kind of fatalism. For the gods did only communicate what will happen in the near future if no remedy or countermeasure were introduced which could change the predicted effects. To put it into modern terms, the interpretation of a single omen could reveal that a person was infected by looming mischief but the onset of the disease could be averted by the application of certain remedies. These remedies were conceptualized as prophylactic rituals and were called *namburbi*. They were staged like a divine judicial court where the subject of the sinister omen could obtain a change to one’s impending fate.¹⁰⁹³ In this procedure the client was advised and guided by an expert whom he (she) had to consult and for whose service he (she) had to pay.

Focussing on the general characteristics of divination in the Ancient Near East it has already become clear that, from the start of our documentation, the whole discipline was developed in a context with scientific structures. The major agents were experts who had to pass painstaking training programmes and who were highly specialized in their activities and fields. Prophecy seems to have been the only field where male and female experts are attested alike, all the other disciplines were dominated by men. Professionalization of the disciplines is also highlighted by a variety of designations concerning the expertise of the diviners. Two important ones are qualified as *āšipu* (“exorcist”) and *bārû* (“diviner”). Whereas the first one seems to have been primarily engaged in interpreting all those signs which were sent by the gods spontaneously, the second one was mainly involved in performing rituals and queries in order to consciously provoke divine omens on the spot. In any case, these specialists seem to have been organized in guild-like structures. Their expertise and knowledge was regarded to be a secrecy revealed by the gods and passed within the exclusive group of these scholars only.¹⁰⁹⁴ At least from the beginning of the second millennium onwards, this knowledge was preserved in written form.

4Series, compendia and commentaries

In their most typical formulation individual omens adopted the quintessential form of Mesopotamian logic.¹⁰⁹⁵ This logic was encapsulated in a casuistic sentence comprising of two different parts. In the first part which can be

characterized as protasis a certain observation was presented. The second part which can be labelled as apodosis rendered the interpretation in form of a forecast. Although in its beginnings divination seems to have been based predominantly on real observations the factor of writing became more and more a creative ingredient of this “science”. There was extensive use of hermeneutic and organizational principles for the purposes of the growing collections of omina which became manuals and handbooks over the century. This process of canonization can be observed since the second half of the second millennium. Most of the series and handbook created in this context have been preserved in the famous library of the Assyrian king Assurbanipal (668–627 BCE) which was hosted in Nineveh and which can be regarded as one of the world’s first “globalized” collections of knowledge and books preceding the library of Alexandria for more than three centuries.¹⁰⁹⁶

The series and compendia developed in these contexts are enormous. The most important collection of astronomical omina *Enūma Anu Enlil* comprised about 70 tablets (experts: *āšipu* and *tupšarru*).¹⁰⁹⁷ A diagnostic and prognostic handbook of

40 tablets and about 3000 entries was dubbed *Sakikkû*. Its primary concern were all kinds of human disease which were interpreted as disruptions of the relationship between man and god (expert: *āšipu*).¹⁰⁹⁸ Physiognomic and morphoscopic omina were gathered in different series with more than 2000 entries (expert: *āšipu*).¹⁰⁹⁹ Dreams were collected in a Dream book of 11 tablets (experts: *šā’ilu* and *bārû*).¹¹⁰⁰ One of the largest collections was called *Šumma ālu*. The series consisted of 107 tablets some of which contained more than 200 lines. It was a collection of private omina taken from miscellaneous occurrences in man’s everyday life dealing with all kind of conspicuous incidents of the physical surroundings. The behaviour of animals played a major role in this context. 15 Tablets (64–79) were devoted to the interpretation of the flight of birds in the sky. The total number of omina originally included in this series was probably around 10.000 (expert: *āšipu*).¹¹⁰¹ The major concern of the 24 tablets of the series *Šumma izbu* were all kinds of monstrosities, human and animal ones alike (expert: *bārû*).¹¹⁰² The seminal importance of extispicy is documented by the series *iškar bārûti* with more than 100 tablets and some thousands of omina (expert: *bārû*).¹¹⁰³ Experts and catalogues were produced to facilitate access; commentaries were a major tool for the interpretation of the omina.¹¹⁰⁴ One of these, *Mukallimtu*, commented upon terminology, another one, *Multābiltu*, comprising of 17 tablets, gave insights into the hermeneutics of the discipline.¹¹⁰⁵

The important series *iqqur īpuš* was organized as a menological and hemerological handbook, the basic conception of which was the belief of the existence of favourable and unfavourable days/months for all sorts of activities which had meticulously to be adhered to. Such activities encompassed the erection/restoration of any building (house or temple), every cultic operation, the construction of tombs, work on the fields, in the garden

5Extispicy and hepatoscopy

As already mentioned extispicy was performed by the *bārû*-expert. Apart from the compendia, series and canonical texts his activities are mainly attested by extispicy reports,¹¹⁰⁷ rituals,¹¹⁰⁸ queries¹¹⁰⁹ and letters.¹¹¹⁰ The bulk of evidence originates from Old-Babylonian¹¹¹¹ and Neo-Assyrian times. According to these texts it is clear that many diviners were in the service of king and court and that their discipline intrinsically touched state affairs. This is also true for other forms of divination. The diviners had to be paid for their service and the sheep had to be purchased. Although this was expensive, diviners could also be hired by private clients as Old-Babylonian extispicy reports exhibit. There we also learn that diviners routinely loaned silver and barely for the purchase of ritual sheep. It seems that even female diviners did exist although this might have been fairly exceptional.¹¹¹² The private Old-Babylonian reports preserve the names of clients, the period for which the query was effective, the date of performance and the issue for which the extispicy was performed. Sometimes the result is also adduced. Thus, e.g. BM 26594 reads: “One lamb of the ritual of the diviner, for the (advisability of a) business enterprise, from Month 5, Day 10, to Month 6, Day 2, flesh for the ritual”. What follows is the report, and the document concludes: “For Galdani, as far as the (oracular) message, it was favourable. Month 5, Day 10, Year Ammišaduqa 11”.¹¹¹³

Apart from Old-Babylonian documents, especially from the city of Mari,¹¹¹⁴ diviners serving court and king are very well attested in Neo-Assyrian times. The queries and reports originate chiefly from the reigns of Esarhaddon (680–669 BCE) and Assurbanipal (668–627 BCE). Like in Old-Babylonian times the god regarded to be responsible for this discipline is the sun god Šamaš. The queries are placed before him, and both, queries and reports draw their omina from the relevant extispicy manuals and compendia of this time. The subject matters are highly political ones. They deal with the intentions and activities of named and unnamed enemies, the loyalty of officials, the prospective appointees to different offices and the illness of the royal family. Whereas these queries and reports are the working copies of the diviners at the Assyrian court writing in coarse hands, there is another divinatory genre attested, also consisting of queries, called *tamītu*. These texts which share an unquestionable similarity in the formulary with the Sargonid queries do not address Šamaš alone but the duo Šamaš and Adad. They are archival copies from professional scribes. Why they introduced the storm god Adad and wrote as if the inquiries were always to Šamaš and Adad jointly is not clear.¹¹¹⁵

Like the Old-Babylonian reports the Neo-Assyrian queries designate a specific period of time for the efficacy of the extispicy.¹¹¹⁶ In the extant queries this is from 7 to 100 days (and nights). The query itself abounds in stereotyped key phrases. In its most elaborate formulation it is structured as follows: “RN¹¹¹⁷ who is now intent on sending ... (and whom) your great divinity knows – in accordance with the command of your great divinity, Šamaš, great lord, and your favourable decisions, should RN strive and plan? ... Is it pleasing to your great divinity? If he, having planned, sends ...”.¹¹¹⁸ The query usually ends with the following closing formula: “Does your great divinity know it? Is it decreed and confirmed in a favourable case, by the command of your great divinity, Šamaš, great lord? Will he who can see, see it? Will he who can hear, hear it?”.¹¹¹⁹

The reports are autopsies performed on dead sacrificial sheep where the physical condition of the exta of these animals is recorded. The nomenclature is highly technical but recent research could clarify most of the terms.¹¹²⁰ The entire exta of the sheep came under scrutiny but the starting and most important point of the inspection was the liver. The reports note “fixed” anatomical parts like liver, lungs, heart intestines and parts thereof like the gall bladder. On the liver itself four markings which usually appear as creases or fissures gained major importance. As Ivan Starr puts it: “It was the absence of any of these or any other part of liver, their dislocation from their normal position, or any other abnormality observed on them by the haruspex which made them ominous, and predictions were derived from their abnormalities”.¹¹²¹ Furthermore, there were fortuitous markings (holes, abrasions, blisters, scars, fissures) whose presence and condition was meticulously observed and regarded to be ominous. It is interesting to note that the liver itself as a whole was never an object of examination but its parts were. The exta enumerated in the reports appear in a kind of canonical order which seems to have remained unchanged from the second millennium onwards. This also applies for the different parts of the liver itself. The inspection proceeded in a counter-clockwise direction. Whether there exists a pictorial representation of such an inspection¹¹²² is debated.¹¹²³

6Ritual performance

The whole inspection was embedded into a ritual framework. At the beginning the diviner underwent a rite of purification. Therefore he used cedar and tamarisk as cleansing agents. The sacrificial animal was introduced and consecrated. This animal, a lamb or a ram, had to be immaculate and impeccable. The ritual had to take place on a favourable day only. The days 7, 14, 19, 21, 28 as well as the days around the disappearance of the moon, i.e. the 29th, the 30th and the first were avoided. The procedure started with the

question posed to the divine council chaired by Šamaš. This question to which a reply in the form of “yes” or “no” was expected, was whispered into the ear of the lamb which was given as an offering either to Šamaš (and Adad) or to the personal god of the client for whom the ritual was performed. It was accompanied by *ikribū*-prayers which could contain a petition to the divine council. An important element was the so-called *ezib*-formulae. They express excuses for any unintentional error which might creep into the ritual. The sacrificial animal was slaughtered according to a settled procedure. The throat was cut, the animal decapitated and dismembered. Parts of the flesh were presented to Šamaš as meal to be consumed. Only after the sacrifice as such had taken place, the diviner started his inspection. First he inspected the intestines still in the sacrificial animal’s body noting their design and the number of the windings. After that they were taken out together with the other entrails. Although heart and lungs were also inspected the liver was the most important object of investigation. It was subjected to a detailed examination of the *facies visceralis* where no single piece is equal to each other. The diviner proceeding counter-clockwise meticulously examined well defined squares on the liver. All these squares were organized in a right and left side. Whereas the right side was regarded to be “my side” (*pars familiaris*) the left side was the “side of the enemy”. This definition was the key element for any interpretation. Well-shaping of the right side was favourable, defection was unfavourable. On the left side it was to the contrary. Well-shaping was unfavourable for the client, defection favourable. The final result was established by counting the negative and positive signs and putting them into relationship. Did the positive signs prevail, the god answered “yes”. Did the negative ones predominate, the god answered “no”. If the answer was unclear the ritual could be repeated.¹¹²⁴

7King and Diviner

A very special client was the king. To work in his service was not only prestigious but the diviner’s profession immediately conveyed a political dimension. As we especially know from the rich documentation of Neo-Assyrian times, the Assyrian king availed himself of many different divination techniques which were also used for check and balances. Besides astrology, prophecy and oneiromancy, extispicy held a seminal position in this context. By this, the diviner’s knowledge and expertise can be defined as a kind of “Herrschaftswissen”, i.e. a technique essential for any political system and ruler to keep power in his hands and to act successfully in political affairs.¹¹²⁵ This implied some kind of control of the diviners by the king. Thus, they were put under oath. This oath was conceptualized like a treaty: “The scribes, haruspices (*bārū*), the exorcists (*āšipū*), the physicians and the augurs staying

in the palace and living in the city will enter the treaty on the 16th of Nisan. Now, let them conclude the treaty tomorrow”, as Issar-šumu-ereš informs Esarhaddon in a Neo-Assyrian letter.¹¹²⁶ Also in Old-Babylonian Mari, diviners were sworn in by the court, for they were taken to be secret carriers. They were obliged to report all meaningful observations to the king only and to no one else. The court’s demand for these specialists and their service seems to have been enormous. From Old-Babylonian Mari we know that the royal diviners required between 429 and 707 animals every month which is an average of 510 a month and 6020 each year.

Every diviner had to comply with certain qualifications, social and physical ones. A telling source for this is an aetiological legend from Neo-Assyrian times where we learn how Šamaš and Adad revealed the *bārû*-lore to an antediluvian king of Sippar, Enmeduranki by name.¹¹²⁷ According to the text only diviners from families of Nippur, Sippar and Babylon were regarded to be qualified. They had to be born in the right family. Since these experts had professional secrets, a father had to pass his knowledge to his son. As a consequence the number of the experts was restricted. From a modern point of view this also had the effect to ensure “a sufficiency of work for all members of the craft”.¹¹²⁸ But there were not only social requirements. A healthy, defect-free body was of essential importance as well.

8Conclusions

Reviewing the evidence of Ancient Near Eastern divination in general and for extispicy in special two important aspects of this craft become evident. The first aspect is the continuity of the phenomenon documented in our sources for almost two thousand years. This continuity shaped a highly standardized and systematized discipline which was conceptualized by a scientific spirit with manuals and handbooks on the one side and with well established hermeneutics and rules to interpret the ominous signs on the other side. The premise for all this was the conception of a world full of signs sent by the gods to communicate with man. As far as extispicy is concerned the liver was regarded to be the “tablet” where the divine messages became manifest. These messages had to be decoded and this was done by specialists with professional knowledge carefully chosen and educated, who established a kind of guild. The members of these guilds were distinguished by their knowledge and by the secrets of their profession which were kept inside the peer-group.

The second aspect is important as well. Even within the area of the Ancient Near East local diversifications and adaptations can be observed which show that extispicy, as well as other mantic disciplines, like e.g. the augurs’ craft, were not only wandering but changing as well, integrating local and regional developments and requirements. Furthermore, our view on divination in the

Ancient Near East is, due to the sources available, primarily a view on the practice and performance of the craft in the context of the social élites. Yet, it is evident that divination techniques were used and consumed by all strata of society. Apart from specialists also laymen were very much active in these fields.¹¹²⁹ Thus, the spreading and diversification of mantic techniques from Babylonia proper to east and west was a highly dynamic process taking place on a plenty of different levels, social and regional ones. Itinerant specialists and experts may have played a crucial role in this process,¹¹³⁰ when, especially in the first half of the first millennium, the geographical horizon of the Neo-Assyrian empire started to encompass the Mediterranean as a whole.¹¹³¹ Within this intercultural framework, mantic techniques were transferred to the far west in complex processes on a multitude of ways.¹¹³² The visible traces of the mantic series *Šumma izbu* in Cicero's *De Divinatione* show that Italy was within the reach of this influence.¹¹³³ The Etruscan liver models discussed at the beginning of this paper are a telling part of this process. Although dated not earlier than to the third c. BCE, they witness vibrant and intricate intercultural exchange which evolved many centuries before.

Marie-Laurence Haack

21Prophecy and divination

Abstract: Emphasis will be given to Etruscan religious “science,” which had the reputation of being excellent. A divination is discernible whose main principles are put down in writing in three kinds of books—haruspical books (*libri haruspicini*), books on lightning (*libri fulgurales*) and ritual books (*libri rituales*), and prophecy art resting on the poets’ inspiration. We will try to know who the gods who pass on their will to men were. Lastly we will focus on men who interpret this will, on their gender, their behavior and their social status in an independent Etruria and after the Roman conquest.

Keywords: Haruspex, books, prophets, lightning, fate

Introduction

What we know of Etruscan prophecy and divination has been transmitted primarily by testimony from the Roman period, as the Roman world was passionate about Etruscan divination, which seemed far superior to traditional Roman divination. The Roman historian Livy (5.1.6) depicted the Etruscans as “the most religious of men.” Etruscan prophecy and divination essentially designates prophetic and divinatory practices that were considered Etruscan by the Romans. Romans distinguished Etruscan methods not only from their own practices, but even more so from those of the Greeks. While the Greeks relied on inspiration, the Etruscans developed a “science” of divination and prophecy (*haruspicina*) through a series of techniques that enabled them to distinguish and interpret the signs sent by the gods and to appease their anger. However, although recognized as superior in the art of divination, called *artificiosa*, based on a certain technique, the Etruscans also had their own prophecy.

1The religious “science”

A)Divinatory knowledge

– knowledge, not a gift

The supposed superiority of the Etruscans in prophecy and divination stems

from the idea that from generation to generation, the Etruscans passed down a body of knowledge, called *disciplina* in Latin. Unlike the Greeks, who looked to divine inspiration to predict the future or to interpret the present, the Etruscans used an inductive method, transmitted orally in families or from teacher to student, as well as through books and written artifacts like bronze livers.¹¹³⁴ Prophetic and divinatory knowledge of the Etruscans is based on principles tested, explained and enriched by the experience of soothsayers (Cic. *Div.* 2.50), who interpreted them according to the ideas of their time.¹¹³⁵ Every strange phenomenon was therefore noted, analyzed and interpreted according to a complex casuistry, with special cases and exceptions.

– book knowledge

The use of books of divination was so special in the eyes of the Romans that they considered books by Roman scholars of Etruscan origin (for example, Tarquinius Priscus and Aulus Caecina), which were translated into Latin in the first century BCE, to be purely Etruscan. For the Romans, they were *Etruscorum libri*, *Etrusca scripta*, *chartae Etruscae*, *Tuscorum litterae*, *Tusci libelli*. The consultation of these books goes back to the beginning of the legendary Etruscan divination. The first books specifically devoted to prophecy and divination are said to have been dictated by Tages.¹¹³⁶ This child in the form of an old man is said to have been plowed out of a furrow by a farmer, and to have revealed the principles of Etruscan divination to the leaders of the twelve Etruscan cities (Cic. *Div.* 2.50; Lydus *ost.* 1.3). It is possible that possessing or writing books on haruspicy was the prerogative of noble Etruscan families. One of the sarcophagi from the tomb of the Pulena family of Tarquinia, dated to about 270 BCE, bears on its cover an image of the deceased, holding an open scroll, on which we find the genealogy of Laris Pulena, the deceased author of a book on haruspicy.¹¹³⁷

– The books

According to Cicero (*Div.* 1.72), these principles were divided into three types of books, haruspicy books (*libri haruspicini*), books on lightning (*libri fulgurales*) and ritual books (*libri rituales*). The first type was dedicated to haruspicy, the study of the liver of sacrificial victims. The Etruscans considered the liver, a large and bloody organ, as the center of life and observed it during the bloody sacrifice of an animal offered to the gods. In Roman times, however, soothsayers were also interested in other internal organs, the *exta* such as the heart, spleen, kidneys and lungs. There was also knowledge of this in Mesopotamia and Greece (see [chapter 20](#) Rollinger), but Etruscan knowledge was so developed and so specific that the Roman lexicographers derived the Latin word for soothsayer, *haruspex*, from *hariuga*, a word which meant “victim;” in Etruscan, several words probably designated haruspices according to their specialty: *netsvis*, *trutnvt* and perhaps *frontac* in a bilingual inscription of Pesaro (*ET Um* 1.7).

The soothsayers were interested in the colors, shapes, sizes and locations of these *exta*. Any abnormality was the subject of special attention, especially when the liver was affected. On this liver, it was necessary to distinguish *pars familiaris*, whose meaning affected the observer or the sponsor of the extispicy and *pars hostilis*, which concerned the fate of their enemies. The soothsayers looked at the familiar crack and the hostile crack that divide the liver into two distinct lobes, and the protruding ends of the liver, especially the “head” (*caput iecoris*) of the liver, a bulge located at the end of the right lobe. The final opinion of the prophet took into account all of his observations.

The second type of book (*libri fulgurales*) applied to the study of lightning and thunder, and may have been revealed by a nymph named Vegoia (*Serv. Dan.* 6.72). The Etruscans believed that the gods sent the lightning bolts (*manubiae*) and gave them different appearances depending on their state of mind with respect to men. It was, therefore, necessary to pay attention to the color, noises and lightning effects to determine their significance for men. Tinia’s casks, the Etruscan Zeus or Jupiter, would have been blood red, but those of eight other gods were light or dark. The lightning was interpreted differently depending on whether it was diurnal or nocturnal. Lightning that struck a public place involved the whole community and was therefore called “royal lightning.” The soothsayers also wanted to know if lightning pierced, burst or burned an object. Above all they tried to determine from what part of the sky the lightning came and what route it had traveled. The sky was divided by the four cardinal points, each of which was further subdivided into four. The sixteen “boxes” of the sky were supposedly the houses of the gods. Identifying where the lightning came from was therefore equal to identifying the god who sent it. When lightning came from regions of the sky from north to east represented the greatest happiness (*Plin. HN* 2.143), while the regions of the sky from west to north represented the greatest misfortune (*Plin. HN* 2.143).

The lightning bolts were further ranked according to their message: the “fateful” bolts were related to destiny and therefore carried a lesson about the future; the “raw” bolts had no meaning; the “vain” bolts that had not been well observed could not provide information and were therefore left out. Fateful bolts were further divided into “advisors,” which provided warning about present or future events and “authorities,” which indicated whether a past action was good or bad (*Sen. Q Nat.* 2.39.1). Other distinctions introduced differences between “ostentatious” bolts that expressed a threat, “admonitory” bolts that warned of danger, and “postulatory” bolts through which the gods demanded a sacrifice or a ceremony (*Sen. Q Nat.* 2.49). The divine message also had a variable duration.

A “perpetual” bolt was significant for the duration of a man’s life; a “finite” bolt for a day and a “future” bolt’s effect could take place ten years later for an individual and thirty years later for a city (*Sen. Q nat.* 2.47). Men could

then act upon the bolts, especially when they carried fatal messages. Thus they could bury or expiate them. The Roman poet Lucan in his *Pharsalia* (1.606–608) shows a soothsayer named Arruns expiating bolts by purifying the place struck by lightning. While praying, the seer buries the remains of lightning in a pit surrounded by an enclosure (*bidental*) and he devotes it by sacrificing a sheep to the god who sent the lightning.

Finally, the Etruscans had a reputation for being capable of provoking lightning (Plin. *HN* 2.140), which may be expressed in Latin by the designation of certain soothsayers as *fulguratores* (*ET* Um 1.7). This “weapon” was used from the earliest times to the end of antiquity. The Etruscan king Porsenna used it to liberate the city of Volsinii from the monster Olta (Plin. *HN* 2.140), in 408 C.E. the Etruscans also boasted of having repelled the attack of the troops of Alaric against the city of Narni in Umbria (Zos. 6.41.1–3).

The third type of book brought together a wider variety of subjects than indicated by their titles (books of rites, *libri rituales*), since there were books on wonders (*ostentaria*), books of fate (*libri fatales*) and books of Acheron (*libri Acheruntici*). Books on wonders treated all the phenomena by which the gods could send signs to men (*ostenta*); the interpretation of these phenomena was considered an Etruscan specialty, as we can see in the words of Cicero (*Leg.* 2.21), ‘prodigies and portents shall be referred to the Etruscan soothsayers’¹¹³⁸. They ranked among the *ostenta* any unexpected event or strange phenomenon occurring in plants, animals and the sky.¹¹³⁹ Specific books were devoted to wondrous signs occurring to plants (*ostentaria arboraria*): there were distinctions between the species of auspicious or ominous trees (*arbores infelices*). The wood of the latter was used to burn the *monstra*, while the auspicious trees provided signs for future leaders on several occasions: a tree that had grown suddenly, at the time of the birth of Vespasian, was interpreted as a favorable sign (Suet. *Vesp.* 5.2). Animals were also receptacles for the feelings of gods towards men. The presence, the transformation or the birth of an animal acquired the status of a sign. A swarm of bees in a public place was an ominous sign (Cic. *Har. Resp.* 25; Liv. 27.23.2–4; Plin. *HN* 11.55; Jul. Obs. 71). A lamb born with purple fleece was considered a very positive omen, or even a royal omen (Macrob. *Sat.* 3.7.2; Serv. *Ecl.* 4.4). Signs from the heavens and from the earth were also carriers of divine messages. The passage of a comet, the earthquakes studied by Tages in a treaty, and volcanic eruptions were evidently feared (Amm. Marc. 25.2.7; Serv. *Dan.* 4.166; Jul. Obs. 29). The Etruscans were masters of observing the flight of birds. Tanaquil, the wife of Tarquin the Elder, was perfectly able to interpret an episode of the arrival of Tarquin the Elder in Rome. The fact that an eagle removed Tarquin’s cap and put it back on his head meant, according to her interpretation, that Tarquin was to rule over Rome (Livy 1.34.9).

A scene from the tomb of François in Vulci, dating to about 330 BCE, in which Vel Saties observes a woodpecker that a child named Arnza is about to

throw, is perhaps a scene of divination.¹¹⁴⁰ In Roman times, divination through the flight of birds appears to have been reserved primarily for augurs. The flooding of rivers and lakes, like Lake Alban in 396, which foreshadowed the fall of Veii (Livy 5.15), also held significance for men. The births of abnormal children or animals were seen as the anger of the gods. Hermaphrodites were often banished, burned or drowned (Livy 27.37.6; Livy 31.12.6; Jul. Obs. 3; Jul. Obs. 22). Attention to divine signs could reach extreme cases in Rome: cattle that had allegedly begun to talk were fed at the expense of the state for the rest of their lives.

The books of fate offered reflections on the lifespans of individuals and communities. It was said that the lives of individuals were organized in a cycle of twelve “weeks of years,” each of seven years, and that people and cities had a destiny counted in centuries. The problem is that these centuries were called “natural:” they had no fixed term, but they were based on the record longevity of the oldest member of the community since the city or the people was founded (Censorinus, *DN*, 14 and 17). An Etruscan’s lifespan allegedly lasted ten centuries, but in some centuries it lasted 119 or 123 years; changes in centuries were marked by prodigies, such as comets or the sound of trumpets (Plut. *Sull.* 7; *Serv. Dan.* 8.526; *Serv. Ecl.* 9.46). Time elapsed neither in a linear fashion nor in regular rhythm; on the contrary, the Etruscans seem to have had a cyclical conception of time in which the present reproduced the past. An Etruscan needed to know the past to know the future. If we follow the principle that history repeats itself, every seer must have been a historian. The frescoes of the Tomb Francois in Vulci show the same episode of history repeating itself three times, in the forms of the Trojan War, the war of Vulcians against Rome in the sixth century, and the victory of Vel Saties in the fourth century.¹¹⁴¹

Latin translations of Etruscan books also pass almost do not mention the use of small discs, lots or strips of lead to interpret the will of the gods. These objects (*sortes*), which archaeologists found in several sites of Etruria (Punta della Vipera, Arezzo, Chiusi, Viterbo, and Tarquinia) and date to between the fifth and second centuries, were mostly perforated and marked with the names of gods (Śuri in Chiusi and Viterbo; Aritimi in Tarquinia). Funeral urns show young people emerging from a vase in the presence of a soothsayer. A bucchero box of the mid sixth century engraved with a dedication to Minerva discovered in the Portonaccio sanctuary at Veii, was probably a reproduction of the lost wooden box from which these spells were drawn.¹¹⁴² It is unclear under what circumstances and how accurately the spells were drawn and interpreted. Livy indicates only that at Caere, in 218, the lots had shrunk (*attenuatas*).

B) Prophetic art

Although less developed than in the Greek world, prophecy had its place in Etruria.¹¹⁴³ Plutarch (Plut. *Rom.* 2.4) mentions an oracle of Tethys Tarchétios, king of Alba Longa, who consulted after seeing a phallus appear in the flames of his hearth. A mirror and Hellenistic urns show a prophet named Cacū playing the lyre to Artile, a young man who transcribed his words on a diptych. Cacū, according to Roman legend, was imprisoned by Tarchon. Moreover, on some urns, Cacū is attacked by the two brothers of the Vibenna family.¹¹⁴⁴ These struggles appear to reflect conflicting influences between cities and their large families, jealous of the sacred books they thought would guarantee their legitimacy. The Greek figure of Orpheus also found echoes in Etruria. A series of Etruscan images shows the oracular head of Orpheus, of a supernatural size, housed in a hole or in a well, which seems to be dictating to a scribe. On several Etruscan mirrors of the fourth and third centuries BCE, a group of deities appears around Orpheus and the young scribe, whose name, Aliunea, was registered once. The head of Orpheus is lying on the ground, singing. The oracular head and the scribe leaning over it are on a series of gems and amulets dated to the third century CE.¹¹⁴⁵

2The gods

The Etruscans' attention to divine signs can be explained by their divine conception of the universe, in which what happens in the cosmos depends on the will of the gods and not on chance or mechanical laws. Control of divination was inseparable from knowledge. In a world in which fate escapes them, men try to get in touch with the gods to satisfy and appease them and to understand their moods. A project or a human action needed to be approved by the gods to be successful. Before undertaking anything important, therefore, men wanted to ensure the benevolence of the gods upon them. The need to know the future was therefore primarily the need to know the state of mind of the gods towards men.

The sacrifice that led to the *extispicina* was thus “consultatorium” (Macrob. *Sat.* 3.5.1; *Serv. Dan.* 4.56), as it was to consult the gods through *exta* of cattle or sheep. The worshippers offered the gods the animal's life (*exta*) and the gods sent the men signs on these *exta*. The attention given to *exta* was based on the idea that the *exta*, the center of the animal's life, reflected, reproduced and summarized the entire universe. In this sense we can say that the liver is a microcosm of the macrocosm. The names of the gods inscribed on the bronze model of a liver found at Piacenza inform us about the Etruscan pantheon. Seneca sums up this Etruscan particularity: “This is the difference between us and the Etruscans, who have consummate skill in interpreting lightning: we think that because clouds collide lightning is emitted; they believe that clouds collide in order that lightning may be emitted. Since they attribute everything

to divine agency they are of the opinion that things do not reveal the future because they have occurred, but that they occur because they are meant to reveal the future”.¹¹⁴⁶

The Etruscans also appealed to certain gods to deify the souls of the deceased with a bloody sacrifice of another kind, of unknown sequence, what the Romans called *ritu humano* “in a human ritual” (Gell. 5.12.12). Rather than make a human sacrifice, it meant the bloody sacrifice of an animal in exchange for a dead man. The blood of the animal, which represented the person’s soul (*anima*), was offered in exchange for a place among the gods for the deceased, and the deceased then became a “god made of a soul,” according to a doctrine of the *dii animales* (Macro. *Sat.* 3.5.1).

3The Men

– gender

Those who worked to predict the future or to interpret it were primarily men, which does not mean that women had no skills in divination and prophecy. As we have said, Tanaquil, the wife of Tarquin the Elder, interpreted the removal and return of Tarquin’s cap by an eagle as a sign. In the Hellenistic period, women of Vulci may have held the priesthood (*hatrencu*) in a college. A woman depicted on a sarcophagus from the third century BCE (now at the British Museum) has the attributes of a bacchante or a priestess of Bacchus or Fufluns, the Etruscan Bacchus, but we do not know if these priestesses had the skills of divination and prophecy.¹¹⁴⁷ Finally, among the Etruscan prophets, Vegoia, whose books on lightning (*libri Vegoici*) were kept in the temple of Apollo in Rome, is seen as a nymph in the Latin texts and as the author of a prophecy given to Arruns Veltymnus on the limitation of land and the land registry.¹¹⁴⁸

– dress and instruments

On mirrors, statuettes and urns, the consultations of Etruscan diviners are represented in the same way.¹¹⁴⁹ The haruspices wear a special hat (*pilos*) and a long mantle. The hat is different depending on time and place. It is tall and cone-shaped on a fourth century bronze statuette (now in the Vatican Museums), and on a mirror from Tuscania dating to the beginning of the third century. It appears as a simple hat with a peak on the top on coins from Volsinii dating to the third century, and on bronze statuettes now in Göttingen dating to the late third and second centuries, on which the hat has a large strip in the base and seems to be placed on top of another hat. Finally, on the ash urn of Arth Remzna dating to the late third century, the hat is a thick roll over the forehead and ears. The mantle, too, is different from one picture to another. It is generally very thick and probably made of wool, with a rough

fringe all along its edges and fastened with a large fibula. It probably retains the features of an Archaic shepherd. On the mirrors, the haruspices have their left leg bent and their left foot resting on a rock or a field enhancement. The sacrificial knife is visible on some coins from Volsinii dating from the third century.

– Social origin

At the time of independent Etruria, haruspicy seems to have been taught in the family, from father to son, in aristocratic families. Haruspicy was seen as the prerogative of noble Etruscans by Tacitus (Tac. *Ann.* 11.15; see too Censorinus, *DN* 4.13; Comm. Bern. Luc. 1.636) and according to Cicero (*Fam.* 6.6.3), Aulus Caecina obtained his knowledge in the field of divination from his father, a noble Tuscan from Volterra. A few cases of haruspices of noble birth are known from archaeological sources (Laris Pulena in *ET* Ta 1.17 and Arnth Alitle Pumpus in *ET* Ar 4.4). From the late third century, however, most representations of Etruscan soothsayers are anonymous and texts show that at the time, haruspices of humble origins provided consultations to stewards in agricultural areas (Cato *Agr.* 5.4) and humble folk from the disreputable neighborhoods of Rome (Plaut. *Poen.* 463 ff., 746 ff; Plaut. *Curc.* 483 ff.).

In the Roman world diviners of diverse origins and status called themselves soothsayers.¹¹⁵⁰ Until the early first century, most of the soothsayers were Etruscan and offered consultations to Etruscan customers, but literary sources testify to the early use in the Roman senate and in the army. In the third century, Etruscan soothsayers were called for when the Roman soothsayers were unable to explain a natural phenomenon. One example was when lightning struck the statue of Horatius Cocles between 278 and 250 BCE, – C. according to Gell. 5.5.1; another example is the birth of a hermaphrodite in 207 BCE, according to Livy 27.37.6. Several cases of Etruscan soothsayers present in the Roman armies are also known before Etruria became completely Roman. A soothsayer followed two consuls in 340 to interpret the entrails of a victim before a decisive battle (Livy 9.9.1). Fabius Maximus was warned of danger by haruspices in 215 (Livy 23.36.10) and in 209 (Livy 27.16.15); Tiberius Gracchus used harus pices in 212 and the consul Marcellus was alerted of danger by soothsayers in 208. It seems that Roman institutions had feared that the gradual Romanization of the territory led to the decline of Etruscan divination for their descendants. At the end of the third century, perhaps a *senatusconsultus* decided that a certain number of Etruscan children would be selected to receive instruction in haruspicy (Cic. *Leg.* 2.21; *Div.* 1.92).

At the same time there were official soothsayers at the service of Roman, Italian and provincial institutions, and private soothsayers gave private consultations to wealthy aristocrats as well as to the very poor. The official soothsayers were strictly hierarchical: from the late first century the top

soothsayers were from “the order of 60” (*ex ordine LX*) and were of equestrian rank. Their headquarters were in Rome and their members were chosen from among the members of large families of Etruscan origin until the middle of the first century CE. The order, which had a box (*arca*), was led by a president (*magister publicus* in *CIL* VI 2161; *haruspex maximus* in *CIL* VI 1964 and 1965) who could have then become special adviser to the emperor (Sertinius Maximus Eutyches: *BMusInscr* III, 540; *ILS* 8833; C. Umbricius Melior: *AE*, 1930 52; Suet. *Galb.* 19.1; Plut. *Galb.* 24.4–5; Plin. *HN* 10.19). The order, however, was apparently intended to assist the Senate in case of prodigies (Phlegon, *Mir.* fig 25). In 47 CE, in order to counter the development of foreign superstitions, the Emperor Claudius reportedly proposed to the Senate a transformation of the order in college like the college of pontiffs or *flamines* (Tac. *Ann.* 11.15). However, the attempt appears to have been in vain since no college of soothsayers is later attested, while there was a renewed interest in haruspicy during the reign of the Severi and while the imperial haruspicy became a paid function (*ducenarius*). In the provinces, the soothsayers of governors had different statutes, as they advised the governors of senatorial or equestrian provinces. The soothsayers of senatorial provinces were of equestrian level, while haruspices of governors of provincial provinces were non-commissioned officers, possibly former haruspices of legions whose functions appeared under the Severi and who were promoted for their expertise. The presence of official haruspices was also required in the municipalities and provinces and colonies of Italy.

Soothsayers are mentioned in the law of Urso (*CIL*, II, 5439, § 62, l. 24–32), a Betic colony, in section 62 among the apparitors of the *duoviri* and those of the aediles, where the remuneration of the haruspices was low. On the inscriptions, the soothsayers of the municipalities and colonies merely mentioned their title “*haruspex publicus*” or called themselves *haruspices* of their city. In addition to this official divination a private haruspicy was developed with very different practices and statutes. Most private haruspices were frowned upon by the writers of Roman times. Cato the Elder (*Agr.* 5.4) forbade his steward to use “a soothsayer, an augur, a soothsayer (*hariolus*) or a Chaldean” for financial reasons and policy reasons, too, to prevent any ferment of revolt in the *familia*. In fact, private haruspicy was extremely popular (Cic. *Div.* 2.9; 2.51; 2.149; *Nat. D.* 1.71), but suffered from disrepute because its practices were regarded like those of astrologers, who were expelled on numerous occasions by the Roman authorities (for example, in 215 BCE: Liv. 25.1; in 139 BCE: Val. Max. 1.3.3; in 33 BCE: Dio Cass. 49.43; in 16 CE: Tac. *Ann.* 2.32). Consultations by private soothsayers were strictly regulated. Augustus (Dio Cass. 56.25.5) and Tiberius (Suet. *Tib.* 63.1) prohibited them from answering questions on the health of the prince, and the haruspex Larginus Proculus was sentenced to death by Domitian (Suet. *Dom.* 16; Dio Cass. 67.16.2) for predicting the day of the emperor’s death. However, when confined to private matters, soothsayers were accused of

quackery (Plin. *HN* 2.24; Juv. 6.396–397; 585–587; Plin., *Ep.* 2.20.3–5).

Official and private haruspicy declined in the fourth century CE with the introduction of anti-pagan laws.¹¹⁵¹ On February 1, 319 (*Cod. Theod.* 9.16.1), private haruspicy was prohibited; on May 15, 319 (*Cod. Theod.* 9.16.2), the ban was extended to all haruspices regardless of their status, then to customers (*Cod. Theod.*, 9.16.4). The haruspices Amantius and Campensis were sentenced to death under the laws of Constantine and Constantius II. Haruspicy was then associated with opposition to the senate. In 381 and 385, two edicts (*Cod. Theod.* 16.10.7; 16.10.9) condemned those who performed sacrifices for divination, in November 392, Theodosius prohibited all sacrifices, and *spirantia exta* consultations regarding the lives of others were prohibited.

22Ships and Shipping

Abstract: History attributes to the Etruscans a powerful maritime presence that testifies to their naval traditions. While the texts, unlike the iconography, provide little in the way of technical precision, historiography attributes several inventions to them, including the ram, and archaeology has confirmed, through the evidence of shipwrecks, their activity within maritime trade.

The most ancient evidence is provided by Villanovian boat models from the 9th and 8th centuries BCE whose characteristics appear original and show that the origins of Etruscan boats reach far back into the past. This originality is confirmed by documents, graffiti or vase paintings, from the 7th and 6th centuries wherein the Etruscan ship often appears as a mixed propulsion craft with a hull that might be equipped with an “added” ram, following the invention of *Pisaeus Tyrrheni* (Pliny, *HN* 7.209). Sometimes it is a sail-powered merchant ship with a powerful cutwater, sometimes it is a warship with a rounded hull and a high set ram.

As well as these typically Etruscan ships, towards the end of the 6th century BCE other boats appear whose characteristics correspond to Greek types: warships with a horizontal keel extending into a ram (hydria of the Micali painter); merchant ships with a concave stempost and two-masted rigging (Tomba della Nave).

Among the shipwrecks holding Etruscan goods, we should distinguish between those where Etruscan products from the same region predominate (*La Love*, *Grand Ribaud F*) and those carrying a varied cargo of Greek and Etruscan goods (*Isola del Giglio*, *Bon PortéI*). While ships of the first category testify to a direct trade and can reach a large size (approx. 1000 amphorae and 40 ton deadweight for the *Grand Ribaud F*), the second correspond either to the emporia trade (*Isola del Giglio*), or to a short distance redistribution trade undertaken by smaller craft (*Bon PortéI*). As for naval architecture, all these shipwrecks refer back to construction systems of Greek tradition corresponding to the Archaic method of sewn boats of the 6th century BCE (*Isola del Giglio*, *Bon PortéI*) or to an evolutionary phase that employed stitching and tenon-and-mortise joints at the end of the 6th and beginning of the 5th centuries BCE (*Grand Ribaud F*). All of this tells us very little about genuine Etruscan naval construction, which we still cannot identify despite its originality.

Keywords: shipwreck, sewn boats, naval architecture, sea trade

An old maritime tradition

The existence of a maritime Etruria, even more powerful at sea than on land according to Titus Livius (1.23.8), is nowadays generally accepted.¹¹⁵² This forceful seagoing presence, as noted by ancient authors, and to which can be added a solid reputation for piracy, is confirmed by historiography that recognizes in the Etruscans, through the attribution of several notable inventions such as the ram and the naval trumpet, ingenuity in naval matters.

This would imply a long and strong maritime tradition.¹¹⁵³ On the other hand, archaeology, through the evidence of shipwrecks and the very spread of Etruscan goods in foreign lands, has demonstrated the active participation of the Etruscans in commerce across the Tyrrhenian Sea.¹¹⁵⁴ Such maritime activity would suggest the existence of war- as well as merchant ships, and a variety of vessel types. One must consider the nature of these ships that were instruments of Etruscan maritime power, the carriers of their trade and the expressions of their naval know-how.¹¹⁵⁵

Ships

The origins

The texts, in the first instance, are not of much help in determining the vessels' characteristics and their nature is rarely specified.¹¹⁵⁶ The iconography, on the other hand, is more eloquent and gives evidence of diversity.¹¹⁵⁷ The Villanovian models of boats found in the tombs of Caere and Tarquinia are evidence of the great age of Etruscan maritime traditions and their ancient indigenous roots. The oldest models are of little craft, probably monoxylon, that were used locally. Other models dating to the ninth and eighth centuries BCE represent more elaborate craft, the size of which is difficult to determine. At the prow—and sometimes at both extremities—several of these feature an animal head resembling a duck (Fig. 22.1.a–b). This motif, somewhat rare, is found in Urnfield culture sites of central Europe and also in the eastern Mediterranean, notably on the boats of the Sea Peoples depicted on the temple of Ramses III at Medinet Habu. Certain authors have made a connection between the Villanovians and the Urnfield culture, and with the *Tursha* of the Sea Peoples, identified with Tyrrhenians originally from Lydia (Hdt. 1.94)¹¹⁵⁸. While one should be cautious about such notions, these connections could nonetheless correspond to memories of very distant origins. In this series, two craft deserve particular attention. The first, which bears holes around the outside corresponding to oar ports, has at the base of the stem and sternpost a protuberance that could represent a protruding keel (Fig. 22.1c). The second also has a protruding keel that extends to the fore as a sort of cutwater and to aft as a leeboard (Fig. 22.1d). In the two cases, the craft seem suitable for maritime navigation and present original characteristics that distinguish Etruscan ships from other ancient boats.¹¹⁵⁹

Orientalizing: the apogee

The period of the seventh and sixth centuries BCE, which corresponds to the heyday of the Etruscan navy, is rich in figurative representation of ships, either graffiti or paintings, mostly on vases. One of the oldest representations of this period, dating back to the beginning of the seventh century, is a graffito cut into a vase from Veii (Fig. 22.1e). The ship has a symmetrical rounded hull and the extremities end in a curling motif aft (the *aphlaston*) and an upward curving motif to the fore (*akrostolion*). The ship has a mixed propulsion system, and is equipped with a central mast ending in a double volute motif that suggests a sort of top. The mast bears a square sail furled to the yard. The schematically represented rigging is made up of different fittings (stays, shrouds, and braces). As well as this sail, four oars are represented on the flank, while aft there are two quarter rudders, one on each side. To either end of the hull there is a raised platform forming a poop deck and forecastle. But the most curious element is the pointed extension beneath the bow of the ship, which has been interpreted as a ram. The strangeness of this feature, which appears to have been affixed to the hull, has often been noted and is considered to be an illustration of the invention attributed to *Pisaeus Tyrrheni* by Pliny (*HN* 7.209) of a ram “added” to the hull.¹¹⁶⁰ The discovery of a bronze ram, today held in the Fitzwilliam Museum, Cambridge, (Fig. 22.2) which is grooved such that it could be attached to the convex bow of a ship, has made this invention appear perfectly credible.¹¹⁶¹ It was not the very idea of the ram itself that the Etruscans invented but a very particular type of ram that was so efficient that the Romans were still using this system in the first century BCE.¹¹⁶² It is instructive to juxtapose this graffito with the procession of ships that feature on two Etrusco-Corinthian vases from

Tarquinius (beginning of the seventh century BCE)¹¹⁶³ (Fig. 22.1f). Despite a certain clumsiness of the painter, common to both vases, who is scarcely concerned with nautical exactitude,¹¹⁶⁴ the ships are clearly similar and of a type close to that of the graffito: the same rounded hull, the same rigging, and on some the same rear platform set above the horizontal line suggesting the presence of a deck. The front end of the hull, however, appears to be cleft and suggests the presence of a ram similar to the previous one we have seen situated below the *akrostolion*. The nature of these ships, with no indication of oar propulsion, is ambiguous. The clearly rounded hull is that of a merchant vessel, but the ram is that of a warship. Because of the mixed propulsion system on the ship of the Veii graffito, one might think that the ships were merchant galleys armed with rams.

Fig. 22.1e: Ship graffito on a vase from Veii (beginning 7th c. BCE). (After Höckmann 2001, fig. 8)

Fig. 22.1f: Detail of a boat from the procession of ships on an Etrusco-Corinthian oenochoe (circa 700–675 BCE, Museum of Art & Archaeology, University of Missouri). (Drawing P. Pomey)

Fig. 22.2: Bronze ram (Fitzwilliam Museum, Cambridge). (After Basch 1987)

Fig. 22.3a: Aristonothos krater (circa 675–650 BCE, Palazzo dei Conservatori, Rome). (After Höckmann 2001, fig. 16)

Fig. 22.3b: Ivory pyxide from Chiusi. (Drawing P. Pomey)

It is most probably a pirate scene that we can see on the Aristonothos krater (c.675–650 BCE) from Caere (Fig. 22.3a). To the left, an oar-powered warship of Greek type lying low in the water, equipped with a ram and bearing three warriors, attacks a single-masted, round-hulled ship sitting high in the water with its flanks reinforced by three wales that jut out from the stempost. The latter vessel, which we can see as an Etruscan merchant ship, is defended by three warriors fighting from a raised deck and by a fourth set in a top at the masthead.¹¹⁶⁵ This ship is characterized by its curious and powerful stempost that ends in a downward turning point. The shape and position of this stempost means that it cannot be considered a ram, but perhaps is more easily seen as a large cutwater.¹¹⁶⁶ It is in this fashion that we can interpret the ship that figures on the ivory pyxide from Chiusi (end of the seventh century) (Fig. 22.3b). Given the amphorae that it is carrying and that represent the cargo, and the lack of oars, we can be certain that this is a merchant vessel. This shape of a well-rounded hull with rising foreparts ending in a downward-turning point can be seen on several other representations of ships.¹¹⁶⁷ This type of stempost, as on the Aristonothos krater, should be interpreted as a cutwater, rather than as a ram.

Fig. 22.3c: Warship graffito on a vase from Tarquinia (7th c. BCE). (After Höckmann 2001, fig. 9)

Thus, from the beginning of the seventh century BCE, Etruscan shipping already presented a very particular silhouette that we will continue to see. It is characterized by a well-rounded hull equipped either with a removable ram or a powerful cutwater. By adopting the possibility of arming merchant galleys as warships, the Etruscans had set themselves apart in terms of naval capability.¹¹⁶⁸ On the other hand, a single mast rigging bearing a square sail with the usual gear and a steering system using two quarter rudders would seem on all points to be identical to other Mediterranean shipping of the same period. Nevertheless, the frequent presence of a top high up on the mast appears as an original feature.

The Etruscans seem, however, to have had true warships as is suggested by the graffito cut into a seventh century BCE vase from Tarquinia (Fig. 22.3c), where a long-hulled ship is equipped with a ram and is propelled by numerous oars.¹¹⁶⁹ It differs in its elongation from another type of warship represented on vases from Vulci (British Museum, H 230) (Fig. 22.3d) and from Caere (Louvre Museum, D 151), both from the beginning of the sixth century BCE. These ships are characterized by a rounded hull, sitting high in the water, equipped with a high ram that fits on a convex stempost according to the Etruscan system. Curiously, the figures in oarsman position are not equipped with oars.¹¹⁷⁰ It is the same type of ship that one finds in the fifth century on what is known as the “navarch’s” stele from Felsina (Bologna) (Fig. 22.3e). Similar to the Caere vase ships, the mast is down, resting upon trestles, and the faces of the oarsmen are turned to the front. Once again we have most probably the same type of warship with rounded hull and added ram, here turned downwards, that can be seen predominately on urns from Volterra of the third and second centuries BCE, although the type has become very clumsily generalized.¹¹⁷¹

Fig. 22.3d: Warship on a vase from Vulci (beginning 6th c. BCE, British Museum, H 230). (Drawing P. Pomey)

Fig. 22.3e: Warship on the “navarch’s” stele from Felsina (Bologna) (end 5th c. BCE). (After Basch 1987) frames of the boats’ internal structure rather than oars which would normally extend beyond the hull (Basch 1987, Fig. 869).

The Greek influence

Alongside these typically Etruscan ships, towards the end of the sixth century BCE, certain ships appear whose characteristics correspond to a Greek type of

vessel. This is the case of the bireme on the hydria of the Micali painter from Vulci (end of sixth century, British Museum) (Fig. 22.4a). This ship features a horizontal keel with a ram as an extension, above which an eye is marked, and a fighting platform set just rear of the stempost.¹¹⁷² Here we have the characteristics of Greek ships of the period.¹¹⁷³ Likewise, the large sailing vessel of the Tomba della Nave at Tarquinia (beginning of the fifth century, Fig. 22.4b)¹¹⁷⁴ has a hull that is altogether similar to that of the merchant ship depicted on an Attic cup (British Museum, B 436, late sixth century) (Fig. 22.4c).¹¹⁷⁵ We have the same bulbous hull with concave stempost and an identical system of wales and gunwale equipped with washboard or bulwarks. The similarities are reinforced by the location and the look of the steering gear and the presence, at the rear, of a removable embarkation ladder. Only the two-mast rigging, underlining the large size of the Tarquinia ship, points out the originality of this latter, an originality that also lies in it being the oldest known representation of such a rigging system on a merchant ship, though the system was to become widespread.¹¹⁷⁶ In these two cases, the analogies with Greek boats are all the more striking because the Etruscan ships show signs, as we have emphasized, of their own originality.¹¹⁷⁷ These ships, like the Greek style galley of the Aristonothos krater, could suggest a Greek presence in the Tyrrhenian Sea. However, they could also signify, as we shall see, the use of Greek style ships by the Etruscans for specific purposes.

Shipping

While shipwrecks and the cargo they carried are evidence of Etruscan participation in traffic across the Tyrrhenian Sea, these are still rather few when set against the volume of trade that can be deduced from the amounts of Etruscan material discovered in land excavations.¹¹⁷⁸ Moreover, shipwrecks that can provide us with information regarding the vessels themselves, their type and their architecture, are even rarer, and the picture that we get is blurred at best.¹¹⁷⁹ First of all, we must distinguish between those shipwrecks holding cargoes of relatively homogenous provenance, in which Etruscan goods predominate, and those characterized by the diversity of product origin. In the first category, evidence of a trade dedicated to the transport of Etruscan goods, we can cite the wreck that lies between the Capo Enfola and Capo Vite on the island of Elba (end of the seventh to the beginning of the sixth century BCE) with a cargo of wine amphorae, *bucchero nero* and bronze basins that came from Vulci;¹¹⁸⁰ the

La Love shipwreck at Cap d'Antibes (c. 560–550 BCE) with a cargo of wine amphorae and *bucchero nero* from the region of Pyrgi-Caere;¹¹⁸¹ the Ecueil de Miet 3 wreck at the entrance to the Bay of Marseilles (first half of the sixth century BCE) with a more or less similar cargo;¹¹⁸² and the Grand Ribaud F wreck off the peninsula of Giens (Hyères, c. 500–475 BCE), with its impressive cargo of wine amphorae, along with bronze basins and discs and Etruscan ceramics from the Caere region.¹¹⁸³ Of these shipwrecks, only those of La Love and Grand Ribaud F allow us an idea of the size of their cargo. The first, which has given us more than 180 amphorae, around eighty ceramic pieces and three schist anchor stocks, would have been a medium-sized ship about fifteen meters long.¹¹⁸⁴ The second, however, with its cargo estimated at 1,000 amphorae lying in five layers, was a ship of some twenty-five in length, perhaps more, and with a carrying capacity of forty tons (Fig. 22.5).¹¹⁸⁵ These dimensions undeniably point to a very large ship for its era that was adapted for a large-scale trade directly from one production region to a single destination. Within the category of wrecks bearing cargoes of diverse origins, the Campese wreck of the Isola del Giglio (c. 590–580 BCE), with its cargo of amphorae and of Etruscan and Greek ceramics, its load of copper, lead and iron ingots, and its bronze Corinthian helmet, appears to be the perfect practitioner of the *emporion* trade as exercised along the Etrurian coasts of the Tyrrhenian Sea by a Greco-oriental *naukleros*.¹¹⁸⁶ The ship, estimated to have been of a respectable size, would have possessed sufficient navigational qualities to allow it trans-Mediterranean maritime capabilities.¹¹⁸⁷ On the other hand, the Bon Porté 1 wreck and that of the most likely identical Dattier correspond to a coastal craft of some ten meters in length.¹¹⁸⁸ With a load of a few dozen Etruscan and Massalian amphorae, along with some Greek examples, these wrecks look more likely to have been part of a redistribution trade, limited in distance and probably setting out from

Fig. 22.5: Plan of the *Grand Ribaud F* wreck. (Drawing M. Rival, Centre Camille Jullian, CNRS, Aix-en-Provence)

Naval architecture

As regards naval architecture, only the Giglio, Bon Porté 1 and Grand Ribaud F wrecks have provided us with sufficiently significant elements of their hulls that we can recognize the construction systems. The hull fragments from the Giglio wreck display exactly the same morphological and assembly characteristics as those of the Bon Porté 1 wreck. Only the dimensions of the pieces are different, pointing out the difference in the tonnage of the two ships.¹¹⁹⁰ The Bon Porté 1 has been identified as a sewn boat, assembled entirely by stitching.¹¹⁹¹ Its construction system is characterized as a shell first method using pre-assembly treenails to hold the strakes in place, then with stitches running through tetrahedral recesses into holes for the plank assembly. Before stitching, rolls of waterproof fabric were placed upon the seams and small pegs were inserted to block the stitches and close up the holes. The frame timbers have a narrow base, flared sides and rounded upper face to allow for a better tightening of the lashings that hold them to the planks. The base is regularly notched to allow the passage of the plank stitching. The interior of the hull was then covered with a layer of pitch mixed with wax to ensure complete proofing and to protect the assembly ties. This system has since been observed on the Jules-Verne 9 wreck in Marseilles (end of the sixth century BCE), where the exceptional state of preservation has led to the discovery of numerous lashings still in place on the planking and framing.¹¹⁹² Going beyond the analogous construction systems, the two shipwrecks, Bon Porté 1 and Jules-Verne 9, are identical in all their parts. The

Jules-Verne 9 wreck corresponds to a large coastal craft for local work, having notably been employed in coral fishing, and could only have been built in a Massalian shipyard.¹¹⁹³ And thus the same must be true for the Bon Porté 1 vessel, which we have seen was involved in short distance redistribution trade in a Massalian context. We should add that the construction techniques employed in Marseilles throughout the sixth century BCE reflect the techniques in use at Phocaea, whose colonizers had founded Massalia at the beginning of that century. Indeed, these techniques would have been those of Greek shipyards throughout the Aegean Sea.¹¹⁹⁴ It is therefore not surprising to find them again on the Giglio wreck, and that would confirm the Greco-oriental origin of the naukleros. From this, the Giglio and Bon Porté 1 wrecks appear to be ships whose construction methods spring from a similar construction tradition testified by several other wrecks and rooted within a well-recognized Greek context,¹¹⁹⁵ not Etruscan. The case of the Grand Ribaud F is more complex, in that its impressive cargo of amphorae from the Caere region, plus the bronze and ceramic objects, make this a wreck in which Etruscan goods are clearly predominant, to the point that J.-P. Morel considers it to be “fondamentalement étrusque.”¹¹⁹⁶ Once again, however, the vestiges of the wreck itself point towards construction within the Greek tradition.¹¹⁹⁷ Although this wreck has only been the object of soundings, the elements of the hull that have been studied are sufficiently representative of the structure and its construction method to identify without any doubt the ship’s architectural system.¹¹⁹⁸ Added to this, there is an exceptional fragment of the starboard quarter rudder, which confirms the iconography and clarifies its operation. All the elements of the hull are strictly identical, except for dimensions given the difference in size between the two ships, to the equivalent elements from the Jules-Verne 7 wreck from Marseilles. Built in a Massalian shipyard and abandoned at the end of the sixth century BCE, this craft belongs to the same family of sewn boats of Greek tradition as the Jules-Verne 9 wreck, and indeed the Bon Porté 1.¹¹⁹⁹ It represents, however, the first stage of a development characterized by the adoption of assembly by mortise-and-tenon joints for the planking and nails for the frames, while stitching is only used at the extremities of the strakes and for repairs.¹²⁰⁰ The analogy between the two ships is such, corresponding to a transition phase of limited duration and bearing on very particular technical aspects, that the conclusion is clear: the Grand Ribaud F ship was built according to Greek tradition. This is not to deny its outfitting, which is certainly Etruscan and leads one to wonder, along with J.-P. Morel,¹²⁰¹ whether the Etruscans employed a Greek to work in one of their shipyards, or if they might have bought, or even captured, a Greek boat according to the practice attested by the Pech Maho lead.¹²⁰² In this regard, we could compare the Grand Ribaud F ship with that of the Tomba della Nave at Tarquinia, which we have already noted as of Greek type. We have also noted that the Grand Ribaud F ship was exceptionally large for its time and that its contemporary, the ship of the

Tarquinius tomb, was likewise a large sized vessel with an innovative two-mast rigging. Thus, we might imagine that the Etruscans could count on Greek-built ships to fulfill particular needs for heavy load shipping, as evidenced by the Grand Ribaud F wreck and illustrated by the Tomba della Nave ship. And in this way, one might propose that the introduction of tenon and mortise assembly into the tradition of sewn construction, as seen in the Jules-Verne 7 and Grand Ribaud F wrecks, had the precise result of a ship construction that was more solid, of larger dimensions and greater tonnage.¹²⁰³

Original but mysterious ships

As we reach the end of this presentation, we come to a paradox. While the iconography, confirmed by historiography, sets up an image of Etruscan shipping as original and inventive, with vessels that are clearly distinguishable from those of other Mediterranean peoples, archaeology struggles to identify these very ships. To be honest, we are at present incapable of characterizing Etruscan ships from the point of view of naval architecture; that is, as regards their structure and their construction method. In fact, certain authors have come to ask themselves whether there was not, in the end, a perfect analogy between Greek naval construction and Etruscan naval construction.¹²⁰⁴ If such a hypothesis can be entertained because of the convergence of Mediterranean naval construction techniques towards the generalized adoption of tenon and mortise assembly, this can only be possible for a relatively late date since we must wait until the fourth century BCE before this convergence is fully realized.¹²⁰⁵ On the other hand, given the originality and antiquity of Etruscan maritime traditions and their Villanovian roots, it is unlikely that there was such a similarity in the Archaic era. Also, it is unlikely that Greek and Etruscan construction techniques had been strictly identical up until the transition phases which characterize Greek construction from the end of the sixth and beginning of the fifth centuries BCE. Moreover, even if it is highly possible that the Etruscans in the beginning employed sewn assembly techniques, as has been proposed,¹²⁰⁶ there is nothing for the moment to affirm, and it would in itself be astonishing given the great variety of sewn assembly systems,¹²⁰⁷ that the Etruscan technique was similar to the Greek technique, which for now still appears to be totally original and without known equivalent. In the same way, we could also envisage, along with Lucien Basch, that the Etruscans were introduced during the sixth century BCE to the tenon and mortise assembly technique by the Carthaginians rather than by the Greeks.¹²⁰⁸ Frankly, we do not know and all hypotheses remain open. It is all too possible that the problem is more complex than we think. Contrary to a rather too easily adopted viewpoint, we should not look at the

problem of ancient shipping from the angle of its permanence in space and time where, effectively, all ancient ships would be equivalent, but rather we need to take into account geographic and cultural differences and the evolution of naval architecture over time.¹²⁰⁹ It is highly probable that Etruscan ship and naval construction evolved throughout the ages. Above all, we must hope that new wrecks are discovered that will finally allow us to study without any possible doubt actual Etruscan naval architecture.

23Harbors

Abstract: Etruscan cities facing the sea—Caere, Tarquinia, Vulci, Populonia, and Pisa—as well as those located farther inland, such as Roselle, Vetulonia, and Volterra, rose, except for Populonia, on raised mounds or spurs at a certain distance from the sea, with which they were connected by watercourses. Along the coast of southern Etruria, harbors exploited the presence of lagoons and other natural basins connected with the sea. Rivers mouths provided good shelter for ships and boats; rivers also penetrate inland and thus are useful as navigation channels. Settlements at river mouths developed from the seventh century BCE onward, following the main stream of urbanism. Trading posts were thus located outside the biggest urban centers but dependent on them, so that a binomial relationship was created between inland “powers” and specialized places on the coast, called “ports of trade” or *emporia*. The concept of harbor is denoted in Greek sources with terms like *limēn* (harbor environment), or *hormos* and *epineion* (anchorage, inner harbor). Technical literature in Latin of later periods, especially portolans (pilot’s books including nautical maps) and *Itineraria*, distinguishes between *portus* (an artificially protected area with installations easing ships’ access; cf. Vitr. 5.12.1), and *statio* or *positio navium* (minor landing site) and *refugium* (small berthing place).

According to literary sources of the Roman period, along the Etruscan Tyrrhenian coast there were twenty-eight landing sites at regular distances of around four to eight kilometers from Porto to the mouth of the Fiora River. The problem of identifying the named sites is not completely solved, because of coastal variation, the dearth of archaeological evidence, and frequent errors in the transcription of distances. It is not simple to distinguish archaeologically between landing sites and constructed harbors, although we know that ancient seafaring did not need specially built berths or docks.

It seems certain that harbor settlements that already existed in the sixth century BCE, such as Pyrgi, Castrum Novum, Gravisca, Regae, Orbetello, Talamone, Populonia, and Pisa, differed in importance from the sites at the mouths of rivers that were natural berthing places.

One may identify some recurrent elements. First of all, the choice of site, which was almost always the mouth of a river or a lagoon in the absence of a bay. In comparison with other areas of the ancient world, major Etruscan cities did not rise on the coast, although each had its own port(s) to which it was connected by a highway. Another remarkable element is the frequent close relationship between such *epineia* and extra-urban sanctuaries, both of which are direct expressions of the power of the city with respect to the external world.

Keywords: Ports of trade, Coastal cities, Extra-urban sanctuaries, Thalassocracy

1Environment and literary sources

Etruscan cities facing the sea—Caere, Tarquinia, Vulci, Populonia, and Pisa—as well as those located farther inland, such as Roselle, Vetulonia, and Volterra, with the exception of Populonia, rose on raised mounds or spurs at a certain distance from the sea, with which they were connected by

watercourses (Fig. 23.1). Along the coast of southern Etruria, harbors exploited the presence of lagoons and other natural basins connected with the sea (see [chapter 69](#) Perkins). River mouths provided good shelter for ships and boats; rivers also penetrate inland and thus are useful as navigable waterways. Settlements on river mouths developed from the seventh century BCE onward, following the main stream of urbanism. Trading posts were thus located outside the largest urban centers but were dependent on them, so that a relationship was created between inland “powers” and specialized places on the coast, called “ports of trade” or *emporia*.¹²¹⁰ The concept of “harbor” is expressed in Greek sources with terms like *limēn* (“harbor environment”) or *hormos* and *epineion* (“anchorage, inner harbor”). Technical literature in Latin of later periods, especially portolans (pilot’s books including nautical maps) and *Itineraria*, distinguishes between *portus* (an artificially protected area with installations easing ships’ access; cf. Vitr. 5.12.1), *statio* or *positio navium* (minor landing site), and *refugium* (small berthing place).

Fig. 23.1: Main Etruscan harbors and related cities, 600–150 BCE

The Etruscan Pilot's Book by Pomponius Mela (*De chorographia* 2.65), which says "Ultra Pyrgi, Minio, Castrum Novum, Graviscae, Cosa, Telamon,

Populonia, Caecina, Pisae Etrusca et loca et flumina; deinde Luna Ligurum,” reflects the situation in the Late Republican period. The system of harbors depicted coincides with that described by Strabo and with a Virgilian list of allies of Aeneas.

The *Itinerarium Maritimum*, another Pilot’s Book of official character ascribed to the time of Caracalla (early third century CE, although according to some scholars it dates only to the fifth–sixth century CE),¹²¹¹ provides a list of landing sites and distances from one *positio* to the next, from the harbor of Rome (*Portus Augusti*) up to the mouth of the Magra River, which marked the northern border of Etruria according to the Augustan subdivision of Italy. Following these sources, we may state that along the Etruscan coast there were twenty-eight landing sites at regular distances of around four to eight kilometers from Porto to the mouth of the Fiora River.¹²¹² The problem of identifying the sites mentioned in the *Itinerarium* is not completely solved because of coastal variation, the dearth of archaeological evidence, and frequent errors in the transcription of distances. It is in fact not simple to distinguish archaeologically between landing sites and constructed harbors, although we know that ancient seafaring did not need specially built berths or docks.

It seems certain that harbor settlements that already existed in the sixth century, such as Pyrgi, Castrum Novum, Gravisca, Regae, Orbetello, Talamone, Populonia, and Pisa, took on greater importance than the sites at the mouths of rivers that were natural berthing places.

2Southern Etruria

The absence of large inlets and gulfs along the Tyrrhenian coast between the mouths of the Tiber and the Argentario prompted the exploitation of channels, river mouths, and lagoons as natural harbors. This was the situation of coastal cities of southern Etruria when they created their own harbors, starting at the beginning of the sixth century. The *epineia* (“seaports”), which were basically devoted to trade, were located at a certain distance from the urban centers, in order to limit the influx of foreigners to these centers.

Moreover, there was usually a strong relationship between these coastal centers and a series of extra-urban sanctuaries. This relationship thoroughly illustrates the territorial control exercised by major cities beginning at the end of the seventh century.

The most inland major Etruscan city, Veii, experienced a different situation. Already in the ninth and eighth centuries it was the destination of Greek trade goods, hinting at a strict and organized exchange with Greek and Near Eastern realms. Control of salt production, perhaps exploited from a Maccarese pond,¹²¹³ and the use of the Tiber Valley as a trade route surely turned the

attention of the city toward the sea as early as the eighth century.¹²¹⁴

The “gateway” to the Tyrrhenian Sea in terms of Greek seafaring is Caere, which, being the closest city to the sea, was markedly distinguished by its international contacts with both the Greek and the Phoenician-Punic world. It had two harbors, which in the third century hosted the *coloniae maritimae* of Alsium, just south of the Palo Castle, and Pyrgi, near the Castle of Santa Severa.

Although the coast of Civitavecchia and Santa Marinella was occupied in the Early Iron Age, the area of Pyrgi¹²¹⁵ apparently was not, even though its environmental features (favorable landing site protected from wind and currents, with potable water available) always exercised a strong attraction. The Etruscan name of this place was obliterated by the Greek name, *Pyrgoi*, “towers,” which is connected with the ethnicon *Tyrsenoi/Tyrrhenoi*, the Greek term for the Etruscans, that is, “the inhabitants of towers” (*tyrseis*) (Dion. Hal. *Ant. Rom.* 1.30.2) (see [chapter 3](#) Korenjak), an epithet which is in tune with the notoriety of pirates lying in wait on the coasts. Pyrgi is also called *metropolis* at a time when the Etruscans engaged in piracy (Serv. *Aen.* 10.184), with possible reference to the mythic origin of the Etruscans from the Lydians, who landed at Pyrgi and occupied Agylla/Caere to become the Etruscans (Verg. *Aen.* 8.479). Around 700, Caere controlled the seaways toward the mining region and the Gulf of Lion and imposed its thalassocracy. The monumental highway connecting Caere to Pyrgi demonstrates the importance, from the economic and military point of view, that Pyrgi held for Caere (like Piraeus for Athens). As for Alsium, the southern harbor, Caere preferred Pyrgi, which connected more easily with the northwestern sea routes. Pyrgi thus became the *epineion* of Caere, and also the seat of its navy (Diod. Sic. 15.14.3; Strabo 5.2.8). It may have been connected with Alsium by a road along the seashore. Pyrgi was destroyed during the events which in 273 led to the confiscation of half of Caere’s territory by Rome. In the earliest phase of the harbor’s use, the existence of monumental docking facilities cannot be demonstrated, due in part to the shifting of the coastline. The likely use of the channel in the seventh and sixth centuries suggests that the two surviving stone platforms were part of the earliest harbor. Around 600, the *epineion* already consisted of two different harbor slips connected by channels: beside the dock in the *porto-canale*, there may have been a second basin, located near the shallow mound on the southeastern side of the sanctuary.¹²¹⁶ The latter berthing area was thus closely related to the monumental area of the sanctuary, enjoying an “epithalassic” location which had few comparisons in Etruria or the ancient world. Giovanni Colonna has demonstrated that the location of the sanctuary primarily related to the presence of a perennial spring of fresh water, an element that in antiquity was deemed as important as advantageous docking facilities in determining the attractiveness of a port.¹²¹⁷ Water from the spring flowed into the ditch separating the two areas of the sanctuary; this ditch may have been connected

with the harbor in the Etruscan period, as well as with some lagoons, as in the case of Gravisca, Tarquinia's harbor.¹²¹⁸ The residential quarter,¹²¹⁹ with a regular layout, occupied the rocky spur where the Roman city and the medieval castle were successively erected. It was separated by a street running toward the sea, at right angles to the Caere-Pyrgi road; this street also marked the limit of the southern harbor. Recent excavations by "La Sapienza" University of Rome have brought to light structures and facilities connected with both the sanctuary and the related berthing basins, illustrating the coexistence of a multiplicity of functions (political, religious, and commercial).¹²²⁰

The site of Alsium, the second harbor of Caere to be sought in the coastal area between the modern villages of Palo and San Nicola, has not yet been precisely identified.¹²²¹ This center, according to the sources (Diod. Sic. 15.14; Dion. Hal. *Ant. Rom.* 1.20, 3.58; Strabo 5.2.3, 5.2.8),¹²²² was a Pelasgian foundation. It also had, like Pyrgi, a Greek-derived name. Moreover, both San Nicola and Palo show paleo-environmental settings favorable for landings, similar to those of Pyrgi. Aerial photos show in both cases ancient ponds and lagoons just alongside the seashore, potential locations for a harbor. Another docking facility has been suggested on the coast of Ladispoli, a site directly connected with Caere by means of the Vaccina River and a system of ponds and marshlands.¹²²³ This may be the *caeretanus amnis* mentioned by Pliny the Elder (*HN* 3.51), a specific topographic reference point for seamen, named together with Pyrgi and Castrum Novum in the territory of Caere. Castrum Novum, near modern Capo Linaro, on the other hand, was one of the few harbors not related to coastal lagoons. It lies in a bay protected by two rocky headlands protruding into the sea. Berthing structures discovered here date to the end of the fifth–beginning of the fourth century.¹²²⁴ In this spot a *colonia maritima* rose in 264, as did one in Fregennae (245), though for the latter there is no evidence for berthing facilities dating to the Etruscan period.

In the Late Iron Age, the existence of simple landing sites may be surmised for Tarquinia as well, exploiting coastal lagoons.¹²²⁵ Tarquinia's control over small docking and berthing sites seems to be indicated by a number of settlements and necropolises scattered along the coast. For the Orientalizing period we do not know the location of Tarquinia's harbor, which might have used the mouth of the Marta River, or, more to the south, the salt pools. The *positiones* of the *Itinerarium maritimum* (Algae, Rapinium, Gravisca, and Martanum) most likely correspond to landing sites of the Etruscan period. Martanum, at the mouth of the Marta, was a docking facility controlled by an ancient settlement. The development of Gravisca beginning at the end of the seventh century is emblematic of the power of the main city, which may have been connected with the harbor by a straight road. Gravisca, like Pyrgi, also exhibits a regular dwelling system and a direct relationship between the harbor and the sanctuary. Alongside an outer berthing facility, corresponding

to the modern-day “porto Clementino” (after Pope Clement XII), the main harbor was probably articulated in a series of basins, connected by channels to the sea. The origin of this landing site seems to go back to the early development of the cult of Aphrodite and Hera based on its freshwater wells, greatly sought after by seamen, and related metal-smelting activities. The coexistence of Greeks and Etruscans was made possible here by the “emporion” nature of the site:¹²²⁶ it might be surmised that the Greeks enjoyed a sort of right of *asylum* under the protection of the sanctuary. Here too, the Roman confiscation of the coast was the act that preceded the foundation of a *colonia maritima* in 181.

The other great maritime city of southern Etruria, Vulci, located on a bend of the Fiora, a broad, navigable river, directly controlled a riverine dock and possibly also had a harbor at the mouth of the river itself, around ten kilometers from the city. Vulci was connected to the coast by a road joining the coast road; the coast road was already of strategic importance for territorial control and was later partly replaced by the Via Aurelia.¹²²⁷

The northernmost coastal settlement, possibly connected with a docking facility located at the mouth of the Chiarone River, was Pescia Romana, the oldest of Vulci’s emporia, which as early as the eighth century opened to Greek-Euboean trade. Later, at Montalto di Castro (modern Le Murelle), the landing site of Regae (Regisvilla) was activated. It became the most important harbor of Vulci, again reproducing the same city-*epineion* system seen at Caere-Pyrgi and Tarquinia-Gravisca. Strabo (5.2.8) ascribes its foundation to Maleos, a mythic Pelasgian king. In the sea, the remains of a massive barbican protecting the harbor are still preserved. In the sixth century, Vulci’s harbor became a privileged trading terminal, while the inhabited area developed inside a rectangular precinct, which may have descended from a pre-established urban project.

The region north of Vulci, which received the commerce destined for the Albegna River Valley, took advantage of the important natural harbors of Orbetello and Talamone.¹²²⁸ Located on the inner shore of a coastal lagoon connected to the sea, the site of Orbetello developed beginning at the end of the eighth century. With the foundation of the Roman colony of Cosa (in 273), which inherited the role of the Etruscan site, the harbor was provided with impressive structural installations. To the north of the Argentario promontory one may surmise a landing site in the mouth of the Albegna River, a hypothesis which is corroborated by the flourishing during the Orientalizing period of the site of Marsiliana. The harbor of Talamone, on the other hand, began its main development in the sixth century, when in the modern-day locality of Bengodi, a temple was erected, connected to a maritime settlement (the currently available archaeological data refer exclusively to the Roman phase).¹²²⁹ South of the harbor, the settlement of Fonteblanda, on a strictly rectangular grid, was not only a berthing station for Tyrrhenian trade, but also the access to the sea for the settlement system of the lower Albegna Valley,

especially for the site of Doganella, with which it was connected by a road.

The importance of Vulci's mediation through the harbors under its control might explain the great flow of Attic pottery of the highest quality at a very early period, which made Chiusi one of the outstanding centers of Etruria for this kind of import (exemplified by the well-known "vase François"). This flow also involved the Val di Chiana as far as Cortona, and it would be difficult to explain it otherwise in comparison to the other coastal Etruscan cities that were directly open to trade and exchange with Greek cities.¹²³⁰

3Northern Etruria

Natural gulfs and coastal lagoons offer easy landings in northern Etruria as well.¹²³¹ The basin of Lacus Prile (Grosseto province), a wide lagoon fed by the Ombrone River, provided a series of landing sites especially at the foot of the hills on which the city of Vetulonia was built. The city already had several berthing stations between the late eighth and the early seventh centuries. The different ways of accessing the sea testify to long-distance trade developed to exploit the resources of the Colline Metallifere. Some necropolises, such as that of Val Beretta, may be attributed to a center that rose near one of these docking stations located in the southern part of the Follonica Gulf, probably in connection with one of the watercourses flowing through the Pian di Rocca, an area connected with the mining region of Vetulonia.

East of Lacus Prile, the city of Roselle, which controlled trade on the Ombrone River, surely was connected with the sea. Very recently it has been suggested that a river port of Roman age (first century CE to end of the fifth) was located by Spolverino, by the mouth of the Ombrone.¹²³²

The site was interpreted as part of the network of small berthing places along the Tyrrhenian coast, at a point where river, sea, and land routes interconnected. A Republican-period dating for the early establishment of this site is still under discussion.

On the stretch of sea between the mining district of the island of Elba and Populonia and the system of lagoons at the mouth of the Arno River, a major route to inland Etruria and northern Italy, two dedicated port cities were established: Populonia and Pisa, and farther inland, Volterra and Fiesole.

Populonia, with its highly favorable natural harbor, offered a protected refuge and attracted seamen already during the Early Iron Age, when contacts with Corsica and Sardinia are well documented.¹²³³ During the seventh century, Populonia was strictly connected with littoral trade perhaps directly under the control of the cities of southern Etruria. The city rose on a promontory overlooking the sea facing Elba, which was included in its territory with the harbor of Porto Azzurro, on its southeastern shore, which was its best dock for the transport of metallic minerals. The favorable natural

setting of its harbor, the propinquity of Elba, and the wide variety of minerals made Populonia a major reference point in maritime trade. The dock in the Baratti Gulf, which was protected by a natural rocky barrier, had to the north the lagoon of Rimigliano, a passage to the sea which guaranteed entrance to the mining region of Campiglia Marittima. Here, at least from the Late Archaic period, there were a landing berth and a sanctuary of great importance, as is demonstrated by the finding of a series of bronze figurines. South of the promontory of Populonia, the mouth of the Cornia River created a swamp, with sandy mounds and ponds, which extended to the Follonica Gulf and represented the main access to the mining region of Mount Accesa and Massa Marittima. There is nothing to indicate Populonian occupation or control over the harbor of Falesia—twelve miles south according to the *Itinerarium Maritimum*, nowadays identified with Portovecchio of Piombino—during the Archaic period, but this is a possibility. Highly developed ironworking activities in this region prompted the growth of the harbor of Populonia, the first Etruscan city to mint coins, between the late sixth and early fifth centuries (see [chapter 27](#) Catalli). In the second half of the fifth century, Populonia did not suffer the crisis which affected the harbors of southern Etruria and Vetulonia due to naval defeats inflicted by Syracuse. It flourished again during the fourth and third centuries, perhaps because of a special relationship with Rome that was established due to the strategic and military importance of its harbor and the mining activities related to it.

Besides Elba, the other islands of the Tuscan Archipelago (Giannutri, Giglio, Montecristo, Pianosa, Capraia, Gorgona), though at a different scale and in different times, were chosen as locations for landing sites or small *emporia*. In the first half of the sixth century, the island of Giglio hosted a fortified site that also served as a berthing place, and a harbor is well attested there and in Giannutri in the first and second centuries CE and can be surmised for previous periods because of some shipwrecks. In Corsica too, the division into spheres of influence for the Carthaginians and Etruscans, following the conflict with the Phocaeans, led speedily to the foundation of an Etruscan warehouse in Aleria.

The other great city of northern Etruria was Pisa, a city between two rivers (the Auser/Serchio and the Arno), some three and a half kilometers inland, which was connected with the coast by seaways and canals.¹²³⁴ As early as the Orientalizing period, access to the sea was characterized by a berthing system with a series of docking facilities on the coast, from the Point of Livorno to the south, and as far north as the mouth of the Auser (Serchio). In the *Itinerarium Maritimum*, a *Portus Pisanus* is mentioned as well as a landing site at the mouth of the Arno. The excavations begun in 1998 in the area of Pisa-San Rossore¹²³⁵ led to the discovery of shipwrecks that yielded a multitude of archaeological finds in an excellent state of preservation. This discovery brought public and scholarly attention to Pisa's ancient urban layout and to the ensuing reconstruction of port installations from the sixth century

BCE to the fifth century CE. There are various interpretations: according to Stefano Bruni, who carried out and published the excavations, San Rossore was the urban harbor of Pisa, with an extensive basin within an organized complex. Bruni interprets the harbor of San Piero a Grado, by the mouth of the northernmost branch of the Arno, as the *epineion*, the main port of the city, which hosted the Elban iron-working facilities, constructed as a landing site with wooden docks beginning in the seventh century BCE. Andrea Camilli, who continued the archaeological investigations, thinks instead that what was found at San Rossore was the remains of a simple docking station along the banks of the Auser. The system of the *Portus Pisanus* mentioned by Rutilius Namatianus (1.530–40) might more easily be considered a lagoon harbor, according to Camilli, and San Piero a Grado and perhaps Bocca d'Arno were also riverine landing sites, while the existence of an urban harbor provided with structures and installations for hosting ships seems extremely unlikely. Finally, scholars do not even agree about the existence of another harbor, the so-called Porto delle Conche, located on the Auser River and possibly used since the late fifth century as a natural access to the city from the coast.¹²³⁶ Regardless of the varying interpretations, finds at San Rossore testify to a flow of trade which connected Pisa with centers in Liguria and with all the coastal cities of Etruria.

Among the inland centers, in the second half of the fifth century, during the Syracusan protectorate of the Populonia-Elba district, Volterra seems to have participated in the flowering characteristic of the coastal area;¹²³⁷ at the end of the fourth century, a permanent Volterranean slipway was created at the mouth of the Cecina River, north of Vada.

Farther north, a very old route has been discovered that led from southern Etruria along the coast to a series of berthing places connected with major centers of the northern littoral of Etruria, up to the Ligurian coast.¹²³⁸ Among these, besides the small site of Poggio al Marmo, near the mouth of the Serchio, it is important to note the Massaciuccoli Lagoon, with the warehouse of San Rocchino¹²³⁹ (Viareggio), a seaport that was installed at the end of the eighth century and was included in the aforementioned trade system.

In eastern Liguria, by the mouth of the Magra River (modern Fiumaretta), another warehouse has been supposed to have been occupied and used by Etruscan *emporoi* beginning in the first half of the sixth century, coinciding with the abandonment of the landing site at Chiavari. At the mouth of the Boccatoio, at the outlet from the Valdicastello near Pietrasanta (Lucca province), another berthing place managed by the local population (*Liguri*) has been discovered, and farther north another dock near the necropolis of Chiavari. The harbor of Genoa was active from the beginning of the sixth century, performing a role in maritime trade, in a period when the coast of Liguria was under Etruscan influence:¹²⁴⁰ a series of small settlements rose along the littoral, serving as docking facilities, again in connection with mining activities which took place both in the Colline Metallifere and in the

marble mines of the Alpi Apuane and of Versilia. Simultaneously, an Etruscan warehouse was founded in an indigenous context at modern-day Lattes (France).

Finally, again in a northern Etruscan realm, the site of Florence, by the Arno, must be mentioned with the “riverine *epineion*” of Fiesole.¹²⁴¹

4Etruscan expansion: The Adriatic

On the Adriatic coast, which witnessed an early Etruscan presence, a dock near Rimini at the mouth of the Marecchia River was used by the city of Verucchio, which was some fifteen kilometers inland, but strongly oriented toward the sea.¹²⁴²

A basic role was assumed later by Adria,¹²⁴³ on the northern bank of the Po River, which was connected with the sea by channels through the coastal dunes, with the complementary docking site of San Basilio near Ariano Polesine. This Etruscan-Venetian *emporion* was founded around the first half of the sixth century, according to the sources by Phocaeans first and then by Eginetians; in the last decades of the century a massive Etruscan presence is documented, with the major intervention of regularization of the urban layout comparable with those of Marzabotto and Spina.

In the second half of the century, in fact, Spina was founded,¹²⁴⁴ to be interpreted as an answer to the early Greek presence spreading over the Adriatic, which was to reduce the role and importance of Adria. Spina inherited from Verucchio the function of an Etruscan port in the Adriatic, including the trade routes under its control, in a period when the Adriatic Sea had a privileged role in foreign exchange and a basic function with regard to the exchange network for Po-area Etruria. In 480–470, Spina’s urban plan adopted a regular layout, patterned on the city of Marzabotto, with dwellings and canals alternating. It had a major channel communicating with the sea allowing the arrival of Greek goods. Literary sources celebrate the fame and wealth of Spina, recalling its thalassocracy and the subsequent foundation of a *thēsauros* in Delphi (Dion. Hal. *Ant. Rom.* 1.18.4; Strabo 5.1.7, 9.3.8), like the *thēsauros* of Caere. Spina was also considered a landing site of the Pelasgians who settled Cortona and became Etruscans.¹²⁴⁵

Ravenna had a similar urban structure, again located within a river delta, while for the settlement of Forcello di Bagnolo San Vito (Mantua), a pivotal point along the Po-Mincio axis, the function of “riverine *epineion*” has been suggested, as has been said of Florence.¹²⁴⁶

5Etruscan expansion: Campania

Pontecagnano, located in a wide plain near easily accessible coastal lagoons, grew up in a strategic location for controlling a very important maritime route, especially between the Late Orientalizing and the Early Archaic period. During the latter, a new series of settlements has its rise in previously non-urban districts, such as the Sorrentine Peninsula (Sorrento, Vico Equense, Stabiae) and Fratte at the mouth of the Irno River, in a formidable strategic location overlooking both the road connecting Capua to Poseidonia and the Lower Tyrrhenian sea route, using the natural harbor of Salerno by the mouth of the Irno. From the second half of the sixth century, Fratte (ancient Marcina, an Etruscan city according to Strabo 5.4.13) became a major reference point in the exchange network of the Lower Tyrrhenian together with the landing sites on the Sorrentine Peninsula, especially as regards the long-distance sea route of Cumae, as demonstrated by the finding of a conspicuous number of wine amphorae and Attic pottery in the necropolis there.

6Conclusions

One may summarize some recurrent elements, including the choice of sites almost always on the mouths of rivers or on lagoons in the absence of bays. In comparison with other areas of the ancient world, major Etruscan cities did not rise on the coast, although each had its own port(s) to which it was connected by a highway. Another remarkable element is the frequent close relationship between such *epineia* and extra-urban sanctuaries, both of which are direct expressions of the power of the city with respect to the external world.

24 Vehicles and roads

Abstract: After the process of social differentiation began in Etruria in the ninth century BCE, some burial sites with grave goods that identified the deceased as the leader of a community (such as shields and helmets as symbols of authority, and not just as weapons meant for war), contained clay models of wheeled vehicles. At sites from around 775–750, actual vehicles begin to appear in both male and female tombs. From 730–720 on, these vehicles are buried together with banquet and symposium sets and with objects of women's domestic activities. From this date, and throughout the Orientalizing period (especially during the seventh century), political and religious leaders of the proto-urban communities were often interred in monumental burial mounds, and wheeled vehicles actually used during their lifetimes were buried in these tombs together with thrones, utensils for eating meat at banquets, and table services for drinking wine at the symposia. This is testimony to an aristocratic lifestyle emulating the Near Eastern world. At sites from the sixth century, these vehicles are no longer found among the funerary furnishings of the elite who ruled the great Etruscan cities, although the custom lingers in smaller non-urbanized centers where the most sumptuous parade chariots have been found. The custom of burying vehicles in the tombs of the elite is widespread among all non-Hellenized Italic civilizations. The technology evident in these vehicles in both Etruscan and Italic areas does not demonstrate significant differences, and all the finds at our disposal can be studied as one cohesive unit.

The roads systems connecting urban centers with each other and with their landholdings can be traced using a variety of methods, depending upon the chronological period. For the earliest periods we rely mainly on geomorphology and hydrography in relationship to site location. Only from the late seventh century can we study actual archaeological remains in urban centers or between them, where these roads were often preserved by their continuous use until the Roman period.

Keywords: chariots, carts, roads, bridges

Introduction

After the process of social differentiation began in Etruria in the ninth century BCE, some burial sites with grave goods that identified the deceased as the leader of a community (such as shields and helmets as symbols of authority, and not just as weapons meant for war) contained clay models of wheeled vehicles. At sites from 775–750, actual vehicles begin to appear in both male and female tombs. From 730–720 on, these vehicles are buried together with banquet and symposium sets and with objects of women's domestic activities. From this date, and throughout the Orientalizing period (especially during the seventh century), political and religious leaders of the proto-urban communities were often interred in monumental burial mounds, and wheeled

vehicles actually used during their lifetimes were buried in these tombs together with thrones, utensils for eating meat at banquets and table services for drinking wine at the symposia. This is testimony to an aristocratic lifestyle emulating the Near Eastern world. At sites from the sixth century, vehicles are no longer found among the funerary furnishings of the elite who ruled the great Etruscan cities, although, the custom lingers in smaller non-urbanized centers, such as Castro near Vulci or Castel San Mariano near Perugia, where the most sumptuous parade chariots have been found. The custom of burying vehicles in the tombs of the elite is widespread among all non-Hellenized Italic civilizations. The technology evident in these vehicles in both Etruscan and Italic areas does not demonstrate significant differences, and all the finds at our disposal can be studied as one cohesive unit.

The roads systems inter-connecting urban centers with each other and with their landholdings can be traced using a variety of methods, depending upon the chronological period. For the earliest periods we rely mainly on geomorphology and hydrography in relationship to site location. Only from the late seventh century can we study actual archaeological remains in urban centers or between them, where these roads were often preserved by their continuous use until the Roman period.

1 Vehicles

Studies aimed at a philological reconstruction of Etruscan and Italic vehicles began at the end of 1980s in Italy, at the Consiglio Nazionale delle Ricerche.¹²⁴⁷ The first results were published in 1997 in the exhibition catalogue *Carri da guerra e principi etruschi*, where an updated census of the finds almost doubled the number previously known.¹²⁴⁸ These finds are distributed over a geographical area that includes the modern regions of Lazio, Tuscany, Umbria, Marche and Abruzzo in central Italy, Emilia Romagna, Lombardy and Trentino-Alto Adige in the north, and Campania, Puglia and Basilicata in the south. It is useful to show the historical geography of Italy and the ancient cultural areas where the tombs of chieftains and their wives included the vehicles they had used in life, as a symbol of wealth and power (Fig. 24.1).

The Etruscan finds are almost exclusively from princely tombs dating from 775/750 to 475 BCE. In 1997, about 106 graves containing the remains of 119 vehicles of some significance were known. The remains of nine vehicles out of context were added to them. As of 2015, progress in the census and in subsequent excavations and restorations has increased the total number of Etruscan finds to at least 150 units.¹²⁴⁹ Those early studies have allowed us to understand that, with a few exceptions, it was always two wheeled vehicles that were found in these tombs: the chariot, with the driver standing as in the

Roman *currus*; or the cart, driven while seated as in the Roman *carpentum*.¹²⁵⁰ The chariot, drawn by two or more horses (*biga*, *triga*, and *quadriga*), was used by men of high rank to reach the field of battle, to hunt, or to ride in parades. The cart, drawn by two mules or asses, was used not only by men but also by women and served in daily life for short or long trips, with or without luggage, for ceremonies, and even for weddings. Only one two-wheeled vehicle was usually buried in each grave: in over sixty cases it is an individual burial, and in only twenty it is a dual or multiple burial. However, the entire Etruscan panorama shows to date about twenty cases of graves containing the remains of two or more vehicles; in some of these occurrences the tomb contains two or more burials and it is difficult to assign the vehicles to individuals. In still other instances the burial of a single individual is accompanied by deposition of both a chariot and a cart, an occurrence very relevant for studies on social history.¹²⁵¹

Fig. 24.1: The cultural areas of the pre-Roman Italy that adopted the custom of burying vehicles in the tombs of the elite. The numbers indicate how many finds were known in each area in 1997. The + sign indicates the numbers that have increased since the count was made

1.1Chariots

To date, two structurally homogeneous types of chariot with the body balanced on the axle—the most common type in Italy—have been identified in reconstructing Etruscan-Italic vehicles found in tombs dating from the second half of the eighth to the sixth century. The bodies of both are long and

narrow, such that if they accommodated two people, the charioteer and passenger did not stand side by side, but one in front of and one behind the axle. “Version A” is more common and is distinguished by its inverted U-shaped side rails. Etruscan examples of version A are fast chariots like that from the Tumulo dei Carri in Populonia (Fig. 24.2; 675–650) and parade chariots like those from Castro near Vulci (ca. 520) and from Castel San Mariano near Perugia (Fig. 24.3; 530–520).¹²⁵² “Version B” has been found less frequently, and its reconstruction is progressing slowly. Its most striking feature is the ear-loop side rails. The clearest evidence so far for this variant is from the area of Latium vetus, the fast chariot from the Barberini Tomb at Praeneste (675–650)¹²⁵³ and the parade chariot from the Via Appia Antica near Rome (Fig. 24.4; 560–550).¹²⁵⁴ In southern Etruria, the chariot of Greek type from the Regolini-Galassi tomb at Caere (660–650) has side rails of similar shape.¹²⁵⁵

Fig. 24.2: Reconstruction of the fast chariot from Populonia, Tumulo dei Carri

Fig. 24.3: Reconstruction of parade Chariot I from Castel San Mariano (Emiliozzi)

Structural differences between fast and parade chariots underlie the different uses. On the fast chariot-type, the passenger area is created by stretching leather around the lower and central parts of the railings, so as to leave the curved branches free to act as a handhold for mounting the vehicle. Straps fan down from the tops of the curves to keep the upper edge of the leather covering taut. Proof that this system was used is provided by cases where the covering is kept taut by metal frames and the leather straps are replaced by small metal rods (Fig. 24.5).¹²⁵⁶

In contrast, on parade chariots from the sixth century, which were designed to move at a walking pace, the railings do not serve as handrails. All charioteer needed to do to keep his balance was to hold the reins, while the second passenger kept his balance by holding onto the charioteer's shoulder, as can be observed in many scenes of chariot processions.¹²⁵⁷ The side rails could thus be completely enclosed in leather and sometimes completely covered with metal decoration, as observed on the Monteleone di Spoleto and

Castel San Mariano parade chariots (560–550 and 530–520 respectively). The front rails of these vehicles, whether covered only in leather or decorated with additional elements, are shaped like an inverted U and rise consistently to a height of about 80–82 cm above the front curve of the U-shaped floor frames. The design of the side rails is innovative, narrowing toward the front rail and rising to about two thirds of its height. In version A, a small rectangular panel is sometimes inserted as if to fill the space that the rails previously occupied behind the axle; this is a nonfunctional addition and on the most sumptuous examples is covered with bronze revetment. We cannot be sure whether there was a general redesign of parade chariots, given that in the sixth century the same features appear in racing chariots represented in competition, in both Etruscan and Latin iconography. This innovation may have resulted from technology introduced by wheelwrights at the beginning of the sixth century to satisfy the demands of a new elite, for whom the ideological bond between possessing a chariot and its military function had weakened. The transitional stage between the fast and parade chariots seems to have been represented by the Dutuit chariot from Capua.¹²⁵⁸

Fig. 24.4: The parade chariot from Rome, Via Appia Antica, as reconstructed in the Museo Gregoriano Etrusco (Emiliozzi)

In Etruscan-Italic fast chariots the floor frame is always fixed directly onto the axle and draft pole, as in the examples from the ancient Mediterranean area. Reconstructions of chariots from Vulci and Populonia show that these three parts are joined so as to create a rigid traction structure and that the vehicle could only be ridden thanks to a floor of woven leather strips that served to absorb shocks while the vehicle was in motion. This reconstruction is based on a fragment of the wooden floor frame of the Vulci chariot, which shows the holes for the ancient woven leather flooring.¹²⁵⁹ By contrast, Etruscan parade chariots had a wooden shock-absorption system placed between the floor frame and the axle. The reconstruction of this type of system is based on analysis of the external bronze sheets covering the chariots from Castro, Castel San Mariano, Monteleone di Spoleto, and the Barsanti Collection (Fig. 24.6).¹²⁶⁰ This system seems to have been introduced when there was a rigid floor, probably made of wooden slats, rather than a woven leather floor. The vehicles could move but they could not go fast, as demonstrated by the fact that the wheels of three chariots equipped with this type of shock-absorbing system are completely or partially covered with bronze sheeting. Thus, these vehicles were built only for ceremonial use.

Fig. 24.5: Metal roads fanning down from the side rail of the fast chariot from Populonia

Fig. 24.6: Sixth-century parade chariots. (A) Bronze decoration on the rear side panels and shock-absorption systems of the chariots from (1) Monteleone, (2) Castro, and (3) Castel San Mariano (chariot I); (4) the chariot remains from the Barsanti collection. (B) The chariot from Castro. (C) Reconstruction of the shock-absorption system in the substructure between the chassis and the axle of the Monteleone chariot (after Emiliozzi 2011)

The wheels of Etruscan-Italic chariots generally have six or more spokes, and only in very rare cases have four, as in Greek vehicles. The most striking example is the chariot from Regolini-Galassi tomb of Caere. The wooden rim of the wheel (the felly) is in most cases composed of two layers, with the outer layer made from segments of wooden planks and the inner layer from a single bent branch. Metal clamps always hold the joints, and the nailed iron tire contributes even further to keeping the composition stable.

The traction system of Etruscan-Italic chariots from throughout the entire first millennium is consistent, as seen in clay and metal models, depictions, and some actual pieces. There were two horses under a neck yoke which was connected to the vehicle by means of a central draft pole.

In Etruscan iconography, chariots are often shown with a body shape very different from those analyzed here, but to date it has been difficult to recognize them among the remains of the vehicles found in the tombs. Moreover, chariots similar to those of mainland Greece and Magna Graecia sometimes appear depicted together with chariots of the Etruscan-Italic type.¹²⁶¹

1.2Carts

In the 1980s an idea developed that differentiated the remains of chariots from those of vehicles equipped with a trident-shaped metal finial (improperly called “rein guides”).¹²⁶² The 1989 discovery of the tomb of the “Princess” or “Queen” of Sirolo at the necropolis of Numana near Ancona, has led to the identification of this “trident” as a finial for the Y-shaped draft pole of a cart.¹²⁶³ The reconstruction of this vehicle, made both graphically and in a 1:4 scale model, has led to the establishment of the idea that all remains that include trident-shaped metal finials denote the presence of a cart (Fig. 24.7).

These finds are distributed in Etruria, in Latium vetus, in Faliscan territory and in the Picenum.¹²⁶⁴ Since the cart from Sirolo was equipped with wheels that rotate on a fixed axle like those found on chariots, we believe that it had a double function, both ceremonial and utilitarian, for the fast transport of people and baggage. For this reason, the seat is placed at the front of the floor, while the back was reserved for baggage. This type of cart was not embellished with bronze sheets, so it is possible that these carts served their rich landowners as transportation between town and their country estates.¹²⁶⁵

In some examples, the trident-shaped pole finial is found together with a pair of U-shaped metal brackets. The function of these brackets was to hold in place the axle that spun together with the wheel, revolving under a central grooved beam beneath the chassis. Examples of U-shaped brackets come from Acqua Acetosa Laurentina near Rome, Veii, Narce, Vetulonia, Casale Marittimo, Fabriano, Verucchio (Fig. 24.8).¹²⁶⁶ In some occurrences where these brackets have been found, metal disks that covered the hub heads were also found, sometimes together with metal axle caps. These parts allow us to establish a rectangular cross-section for the axle-arm. This rectangular shape distinguishes the (slow-moving) revolving axle from the (fast-moving) fixed axle, which is equipped with cylindrical axle arms. The virtual reconstruction of the cart from Eretum (620–600) shows how this mechanism works.¹²⁶⁷

Fig. 24.7: The cart from Trevignano Romano, Tomba dei Flabelli. (A) detail of the trident-shaped finial. (B) Proposed reconstruction. (Emiliozzi)

The draft poles of these carts are not always Y-shaped but are sometimes centrally positioned under the floor, as on chariots. The masterpiece of this category is the cart of Eretum mentioned above. The cart from the Tumulo dei Carri of Populonia (675–650) was made exclusively for ceremonies, because its wheels were fully covered with bronze.¹²⁶⁸ Another cart from Castel San Mariano (ca. 560) is also ceremonial because its entire body is covered in embossed and engraved bronze sheets.¹²⁶⁹

Fig. 24.8: The iron brackets from Casale Marittimo, Casa Nocera necropolis, tomb A: (a) One bracket; (b) the axle revolving under the grooved beam beneath the chassis (Emiliozzi)

The wheels of carts are built like those of chariots, but in general have a larger diameter. The hubs are generally shorter than on chariots, given that a vehicle pulled by mules or asses is slower than one pulled by horses, and has more stability when going into corners. The shorter length of the hubs goes along with the greater width of the cart body, which is wide enough to accommodate two people sitting side by side, and sometimes even four sitting back to the back.¹²⁷⁰ As a result, the wheel track—or gauge—equals that of the chariots.

2Roads

In Etruria, remains of land transport vehicles go back to the early first millennium in the form of models, and to the second half of the eighth century in the form of actual vehicles, as already stated, while evidence of the roads on which they traveled is known to us only from the late seventh century. The paths of these roads are inferred by combined analysis of different kinds of sources, such as geomorphology and hydrography in relation to the settlements and cemeteries¹²⁷¹ and the late written sources, which are sometimes useful as far back as the Archaic period.¹²⁷²

From within certain settlements, remains of pavements have emerged, mostly related to courts, courtyards, and squares which functioned in monumental houses or buildings. Remains of actual roadbeds have also occasionally been found. In southern Etruria there are occurrences in Veii, San Giovenale, Acquarossa, Tarquinii, Regisvillae, Rusellae,¹²⁷³ and Volsinii/Orvieto.¹²⁷⁴ In Po valley Etruria there are occurrences at Marzabotto, Casalecchio di Reno, Felsina/Bologna, Spina, Mantua, and some minor settlements at Correggio, S. Ilario d'Enza, and Castelnuovo Monti in Reggio Emilia.¹²⁷⁵ In the Etruscan town of Acquarossa, the remains of streets from the end of the seventh century are among the most ancient, with borders and pavement 1.5–2 m wide. Evidence of road maintenance during the first half of the sixth century testifies to the practice of improving the road surface, a practice that appears elsewhere as well, such as at Veii and Caere. During this period, the roads reach 3–4 m in width. During the second half of the century the use of well-paved city streets is generalized and, while still retaining the width of 2–2.8 m, they can also reach 4.4 (Acquarossa, Fig. 24.9) and even 9 m as at Volsinii/Orvieto. The fullest development of the Etruscan road-building technique is documented in the fifth century, both in southern Etruria—as at Tarquinia and Regisvillae—and especially in Po valley Etrurian centers.¹²⁷⁶

Remains of inter-city roadways have also been preserved, either as “*vie cave*” (see below), or as roadbeds used until the Roman empire, where the archaic pavement appears in underlying layers of the later basalt or limestone blocks that have protected them. The roads that come to us thanks to segments unearthed in southern Etruria, for example, cover short distances between the cities and the smaller centers, such as from Veii to Monte Sant'Angelo at Baccano (Roman *Vacanae*), to Nepi (Etruscan *Nepet*), to Lucus Feroniae, to the course of Tiber River, and to Rome. We also know of some roads from big cities like Caere that radiate out into the surrounding countryside. The most important of these, which linked Caere to the port of Pyrgi, was 12km long; its careful construction is attested as early as the second half of the seventh century. At the beginning of the fifth century, at its apex, it was more than 10 m wide and the wear of the old roadway was filled with a mix of pebbles, gravel and sand.¹²⁷⁷ Other roads linked this metropolis to Tarquinii, Veii, and

Rome.¹²⁷⁸ Obviously, these shorter roads combined to form long-distance highways, but never under a single, national jurisdiction until the Roman conquest.

Fig. 24.9: Acquarossa near Viterbo, a segment of a road in the area F (from Östenberg 1975, 193)

These roads from the archaic period normally maintained their natural-soil roadbeds, which were leveled and compacted simply by beating the earth. In the case of level routes carved across the tufa, the originally shallow depth of the road could sink to a few meters below ground level. When the route went through hilly volcanic landscapes, trenches were cut in the tufa, sometimes resulting in very deep gorges called *vie cave*, which are found in great number in southern Etruria, at Veii and the adjacent Faliscan area, at Caere, Norchia, Castel d'Asso, and Volsinii/Orvieto. They have also been found in the Fiora River Valley (southern Tuscany) at Pitigliano, Sorano and Sovana (Fig. 24.10).¹²⁷⁹ Many of them are still in use today, and it is difficult to date their chronological phases.

The wear on the road surface was due mainly to the passage of vehicles with wheels encircled by iron tires, which over time caused deep ruts and compromised the integrity of vehicles using the road. The surfaces required continuous maintenance, and instead of importing slabs of stone to resurface

the roadway, the Etruscans recut and re-leveled stretches as they deteriorated. From the fifth century on, the Etruscans began to restore the surface of these dirt roads with layers of debris and stone chips compacted and contained between edging stones, adding means of water drainage.

Some segments of archaic Etruscan roadbeds are wide enough only for a single wheeled vehicle and not for a second one approaching from the opposite direction. Since the roads were only 1.5 to 2 m wide, vehicles needing to pass each other could take advantage of enlarged roadside shoulders installed at more or less regular intervals. There were also wider roads of 4 m, which were suitable for simultaneous transit of two vehicles.¹²⁸⁰ In some cases, widths of 5.5–6.7 m have been measured where well-preserved sections of road show five to six pairs of parallel chariot wheels ruts. These ruts, which are always mentioned in studies of ancient roads, have not been systematically measured in relation to chronological periods. Some well-preserved examples are 1.10–1.30 m apart, from groove to groove.¹²⁸¹ The width of 1.30 m is not found in the gauge of the few princely vehicles with iron rims found in situ or even reconstructed with their original measurements. In these cases—dating from seventh and sixth centuries—it was possible to determine gauges that vary from a maximum size of 1.19m (Populonia chariot cited above), in intermediate steps of 1.00 and 0.93m, down to a likely minimum of about 0.87–0.88 m. However, these variables are reported in vehicles that come down to us because they were buried in the graves of high-ranking persons, while nothing is known about the utility wagons for the transportation of goods and people in everyday life. Since it is not plausible that there were different rules for utility vehicles and for princely ones, the variables suggest that at least through the Archaic period, roads were built without regard for the gauge of the wheels of vehicles.

2.1 Bridges

As for bridges arching over the rivers, very few remains are preserved, especially from the Archaic period. Many of them were built with wooden planks and obviously did not survive. Among the more elaborate ones, built mainly of wood supported by stone foundation piers, there is the bridge over the Fiora River at Castello dell'Abbadia, near Vulci. Its foundations are Etruscan, but the arches are Roman and its topmost part is medieval. Another example can be found at San Giovenale in inner southern Etruria, where two massive bridge supports of tufa blocks (20 m apart) were constructed on either side of the Pietrisco stream; remains of a stone construction in the river bed

suggests that the bridge was made mostly of wood and was supported by stone pillars.¹²⁸² An alternative method for bypassing a stream in a rocky landscape was to channel the flow of water through a tunnel dug under one of its banks, draining the riverbed. This structure is known as a *ponte sodo* and is evidenced by the bridges named Ponte Sodo and Arco del Pino in the territory of Veii, and by Ponte Vivo and Ponte Coperto near Caere.¹²⁸³

25 Mines and Metal Working

Abstract: *Etruria mineraria* offers the most interesting range of metallic ores south of the Alps. Large quantities of useful ores, such as copper mixed with lead sulfide and even iron oxide, are found in the Colline Metallifere and in high concentrations on the island of Elba, and in Latium in the area of Monti della Tolfa. Pits, shafts, and galleries were excavated in the Prehistoric (Chalcolithic and Early Bronze Age), Protohistoric (Final Bronze Age and Iron Age), and Etruscan periods to obtain metals (mainly copper and silver from sulfides, but also antimonite and tin) from polymetallic ore, and non-metallic products (for example cinnabar from Monte Amiata and alum from open-air alunite quarries). This chapter discusses the distribution of ore and offers a basic overview of techniques used by Protohistoric and Etruscan miners, which were developed further in Roman and Medieval times. Three mining districts are reviewed: the Monti di Campiglia area (Livorno), the Colline Metallifere around Massa Marittima (Grosseto), and the Monti della Tolfa area (Rome), which each present a different level of archaeological investigation and provide a technical and metallurgical framework for the processing of ore and its relationship to settlement systems. Archaeological evidence from mines and metallurgical sites is also used to examine the political influence of some centers in *Etruria mineraria*, namely Populonia and Vetulonia, on mining areas. Special attention is paid to work in progress on Etruscan mining and metallurgical processes for the production of copper and iron from ore using advanced smelting techniques with different types of furnaces for polymetallic sulfides and iron ores. The result is a picture of Etruscan mining and metallurgy that would continue until the expansion of Roman control into the Monti di Campiglia and Populonia districts, with the production of copper and silver from local mines and of iron from Elba apparently ending during the first century BCE, although new surveys in the Colline Metallifere area suggest that limited production of copper, perhaps silver, and certainly iron from local gossan deposits may have continued until the second century CE; some metallurgical sites remained active until the fourth century CE, leading to the field of Early Medieval mining and metallurgy.

Keywords: *Etruria mineraria*; mining landscape; mining archaeology; metallurgy; smelting activities

1 Distribution of ore deposits in Etruria

Etruria offers the most interesting range of metallic ores south of the Alps. Large quantities of useful ores, such as copper mixed with lead sulfide and even iron oxide, are found in the Colline Metallifere and in high concentrations on the island of Elba, and in Latium in the area of Monti della Tolfa (Fig. 25.1).¹²⁸⁴

In central Tuscany, the large area between the Cecina and Bruna Rivers has been called *Etruria mineraria* due to the extensive presence of copper and iron. The abundant production of and trade in metals here between the Final

Bronze Age and the Roman conquest at the beginning of the third century BCE has been connected to the development of Populonia and Vetulonia.¹²⁸⁵ In the Colline Metallifere, copper and lead sulfides have accumulated in contact with thick layers of massive limestone, principally in the Monti di Campiglia area (Livorno), where caves formed by karst processes made it easier for ancient miners to identify and work veins. Some minor ores, characterized by copper sulfides, are also present in the Val di Cecina (Volterra), the Val di Merse area (Siena), and in the Monti Rognosi (Arezzo); there are also some significant sulfide deposits beyond the Arno River valley, in the Alpi Apuane, which faces ancient Liguria.¹²⁸⁶

Fig. 25.1.: Distribution of metallic and non-metallic ore in ancient Etruria (Tuscany and Latium): the area between the Cecina and Bruna Rivers is identified as *Etruria mineraria*

In southern Tuscany, sulfide ores located along the Fiora River valley were valuable ancient sources of antimonite, a mineral used as early as the Chalcolithic period and Early Bronze Age for making ornaments, while the high concentrations of cinnabar on the southern and eastern slopes of Monte

Amiata have been worked since the Chalcolithic period.¹²⁸⁷ The most important metallic and non-metallic deposits lie in the Monti della Tolfa, a mountain range in northern Latium that was thickly populated in the Final Bronze Age by a dense network of Proto-Villanovan settlements and cemeteries. Ores here consist of massive deposits of alunite, a non-metalliferous aluminum disulphate, which was used in antiquity to dye cloth various colors, tan hides, and protect timber from fires. Less important bodies of iron hydroxides, usually gossan deposits generated by the oxidation of deeper veins of copper and lead sulfides, are likely to have been worked in the Prehistoric, Etruscan, and Roman periods, and certainly during Medieval times.¹²⁸⁸

2The mining landscape of Etruria: research on mines and contemporary enhancement

The massive concentration of metallic ores in Etruria has produced a complex landscape consisting of mines surrounded by waste products and the remains of smelting plants, which were often located near mine entrances. Mining activity extends from the Chalcolithic period to the second half of the twentieth century. Certain phases are marked by particular intensity, like the late Protohistoric and the Etruscan periods, which was followed by less activity in Roman times, and a resurgence in the Middle Ages when local feudal powers controlled extraction and reduction activities and *Comuni* used their public authority to control long-distance trade in precious minting metals, such as copper and silver, as well as blooms of rough iron.¹²⁸⁹ The Renaissance was another intense period of mining and metallurgy, in which some previously Etruscan districts, such as the Monti di Campiglia, were mined for copper and lead sulfides using new forms of open air extraction developed under the Medici. Methods of open air quarrying continued to evolve in the seventeenth and eighteenth centuries, as did metallurgy, particularly with improvements in methods of acquiring copper and lead from polymetallic sulfides.¹²⁹⁰ In the late eighteenth and nineteenth centuries, the development of natural sciences such as geology and mineralogy witnessed the introduction of new driving shafts and galleries in mining areas, which often led to the rediscovery and recording of evidence for Protohistoric mining activity and tools made of stone and bone; the resultant field of *archeologia mineraria*, or mining archaeology, provided a new perspective on the history of mining activities in the region (Fig. 25.2).¹²⁹¹

The foundation of the *Istituto di Studi Etruschi* in 1925 was an important step in the research and analysis of ancient Etruscan mining. In the Fascist period, an impressive bulk of iron slag in the suburban area of Populonia was recovered and reused, enabling Antonio Minto to begin a new phase of

research marked by collaboration between mineralogists, botanists, and archaeologists.¹²⁹² After a pause following World War II, during the 1980s, Riccardo Francovich launched a program of mining and metallurgical research at Rocca San Silvestro in the Monti di Campiglia district. This Medieval village had been ruled by local aristocrats who controlled the extraction and smelting of local deposits of skarn—mixed sulfides containing copper and lead—to provide copper and silver for the Pisa mint. Full excavation of the site led to a systematic survey of the zone, including exploration and excavation of the mines, analysis of deposits of extracted minerals, and finally excavation of deposits of slag.¹²⁹³ Similar interests have driven a number of projects intended to recognize and enhance the scientific and historical aspects of particular areas in the Colline Metallifere, such as the *Parco Archeominerario di San Silvestro* (Campiglia Marittima) and the *Parco Nazionale Tecnologico e Archeologico delle Colline Metallifere Grossetane* (Monterotondo Marittimo, Montieri, Massa Marittima, Roccastrada, Follonica, Scarlino, and Gavorrano).¹²⁹⁴

Fig. 25.2: Plan of the Miniera del Cornacchino at Monte Amiata (Castell'Azzara, Grosseto), active between 1872 and 1921 for the extraction of mercury. The position of Prehistoric galleries for the extraction of cinnabar is marked on the right side of the sketch as *linea del giacimento lavorato dagli antichi* (after De Castro 1914)

3The Monti di Campiglia (Livorno) mining and metallurgical district

Internal mine surveys and the development of a comprehensive chronological framework have produced an understanding of extraction works in the Monti di Campiglia district in the Prehistoric (Chalcolithic), Protohistoric (Late Iron Age, mainly eighth century), Etruscan (Archaic, Late Archaic, and Hellenistic phases), and Roman periods. Evidence of mining in these phases is found principally in the core of the basin, at Monte Spinosa, Monte Rombolo, and the Colle I Manienti in the west; in the area of Poggio all'Aione to the east; and in the areas of Romitorio and Monte Coronato in the north. There are also traces of activity around Monte Valerio, where the limonitic masses contain tin (cassiterite).¹²⁹⁵

The first task in ancient mining was to identify the surface of a vein. In natural caves, hollowed out by karst waters, miners could reach sulfide deposits that had accumulated close to the massive limestone. It may also have been possible to recognize altered gossan deposits (typically amorphous red-ocher stains) that were produced by meteoric waters and signaled the presence of a sulfide vein below. Once located, excavations typically followed the irregular course of the vein.

In karst caves a prospector could more easily detect the depth and consistency of the vein or skarn mass; Etruscan and Roman (and probably Iron Age) shafts are usually less than 1 m in diameter, and galleries were quite narrow, between 0.7 and 0.8 m wide, and with a length varying between half a meter and several meters. Remains in the area of Poggio all'Aione indicate that these mines could reach depths of over 100 m with galleries more than 800 m long (Fig. 25.3).

To save work, miners generally began by excavating the oxidized portion of the gossan and then followed the vein underground, leaving empty voids ("cultivation rooms"), where the ore was most concentrated. There are no signs of fire, suggesting that excavations were entirely manual, and traces of iron picks on the vein are chaotic and uneven. Irregularly shaped holes in the walls of shafts and galleries suggest the use of oil lamps, and additional small rectangular incisions, measuring 0.10×0.10×0.05 m, indicate the presence of wooden stairs or platforms. The wooden frames that protect galleries in Renaissance and modern mines were absent in their Etruscan, Roman, and Medieval counterparts. Other discarded material, however, is abundant, and is thought to have been the byproduct of a sorting process that saw only the richest ores taken to the surface in leather sacks or wooden buckets. It is possible that excavations of this material may yield finds such as domestic pottery, amphorae, lamps, and blunt picks that are essential for dating related

mining activities (Fig. 25.4).

Fig. 25.3: Plan and section of the Etruscan mine Buche al Ferro 2 (Castagneto Carducci, Livorno), showing a complex system of pits, shafts, and cultivation rooms for the extraction of polymetallic sulfide ore (courtesy A. Casini and G. Cascone; drawing by G. Cascone)

In the Monti di Campiglia, sites of metallurgical activity appear to have been concentrated at the Fosso di Capattoli, in the valley of Temperino, and in the Podere I Cancellini area, on the eastern side of Monte Calvi.¹²⁹⁶ In Etruscan, Roman, and Medieval times, these activities typically took place on plains with plentiful wood and water, and generated a considerable amount of slag that is now part of the archaeological landscape, sometimes located a considerable distance from the mine. The primary goal in the Protohistoric and Etruscan periods was the extraction of sulfides; the presence of cassiterite in the iron-oxide hydrates at Monte Valerio also suggests the pursuit of tin, although recent investigations of the existing limited shafts and galleries suggests that this was a Roman endeavor.¹²⁹⁷

Fig. 25.4: Cultivation room at the bottom of the Etruscan mine Burian-Fohn (San Vincenzo, Livorno), with discarded material from the excavation of the skarn masses (courtesy A. Casini)

4Evidence for metallurgical activities at Golfo di Baratti (Livorno) and along the Golfo di Follonica (Grosseto)

Mining activities in the Monti di Campiglia must be understood in the context of the broader archaeological and historical framework of Populonia and its hinterland. There is evidence that this settlement controlled the exploitation of

sulfide deposits beginning in the ninth century through a complex network of fortified hilltops dating back to the Iron Age, such as one at Colle I Manienti, which were active until the Hellenistic period.¹²⁹⁸ New data (confirmed by radiocarbon analyses) on smelting processes involving chalcopyrite along the shore of the Golfo di Baratti have revealed that this metallurgical activity is contemporary with close contact between Populonia and Sardinia, and it is thus possible that the confidence and experience of Nuragic miners and metallurgists in working polymetallic ores influenced Etruscan smelting of local skarn.¹²⁹⁹

The smelting of polymetallic sulfides from Campiglia preceded the mining of hematite at Elba: iron reduction processes appear to have occurred after the mid eighth century and promoted an intense long-distance trade in Etruscan iron (see [chapter 26](#), Corretti). Reduction by local metallurgical workshops left immense heaps of slag (calculated to exceed 40,000 m³) all around the suburban area of Populonia: surveys and excavations of portions of the Golfo di Baratti coastline have recently identified areas of metallurgical activity that contain remains of the smelting of non-ferrous ore. Comparison between fragments of crude ore and the mineralogical features of the slag make it highly probable that the ore came from the Monti di Campiglia mines. Slag-cakes suggest a multistage copper smelting process, using tapping, low-shaft furnaces built with sandstone blocks bound by clay mixed with straw, and tuyeres for introducing air into the furnace. The recovery of many partial furnace remains in these coastal deposits may reflect the short life of the plants. Along the shoreline the lowest layers are rich in copper slag, confirming the antiquity of copper production, which can be dated to the ninth and eighth centuries by radiocarbon analysis of their charcoal content.¹³⁰⁰ Superimposed wider layers provide evidence of iron smelting stretching from the eighth and seventh centuries to the Roman period. The presence of tapped slag, often with fragments of tap holes and evacuation channels, indicates the use of slag-tapping furnaces with high walls. These were built with sandstone linings covered with clay, and air was again introduced during the smelting process through tuyeres in the walls; silicate slag was tapped through an opening at the base of the furnace ([Fig. 25.5](#)). Excavation of a limited portion of the coastline has uncovered the remains of two furnaces that were partially dug into the ground. With an aboveground height of approximately 30 cm and an internal diameter of between 20 and 30 cm, their walls were constructed by arranging sandstone and clay bricks or tiles in a horseshoe shape. The furnaces and slag suggest that this plant was used as a smithing area with ironworks, and was active between the fifth and second centuries. The crude and partially roasted or smelted ore from deposits here suggests an origin in the Rio Marina (Elba) iron mines.¹³⁰¹

Fig. 25.5: Hypothetical reconstruction of Etruscan iron furnaces in the Golfo di Baratti (Populonia) area, showing the different steps of iron ore smelting, including the spilling of silicate slag and the final recovery of iron blooms through the demolition of the plant (courtesy Studio Inklank, Florence)

Finds at Rondelli (Follonica) have furthermore provided new knowledge of Archaic and Classical iron-smelting plants along the coast facing Elba. Twenty-one smelting furnaces have been discovered here. They consist of round pits, between 70 and 80 cm in diameter and between 30 and 40 cm deep, with revetments of clay mixed with straw. The clay coverings are often considerably burned. Clay-brick walls had a short life, requiring rebuilding with every smelting operation. The pits were used for the repeated collection of silicate slags, some of which have been found inside. The upper part of the furnaces held layers of iron and charcoal. The opening for the tuyere must have been in the lower part of the wall, with air blown inside using leather bellows or sheepskins. The ore at Rondelli is also reminiscent of supplies

5The Colline Metallifere (Grosseto) mining district

Mixed sulfide deposits around Massa Marittima are interesting but little known as yet. The ore here can be roughly classified into massive deposits of pyrite and mixed sulfides, and less consistent seam deposits of quartz and mixed sulfides.¹³⁰³ Minerals excavated and processed during the Protohistoric, Etruscan, Roman, and Medieval periods include zinc sulfides, galena, chalcopyrite and limonite, while a substantial deposit of iron sulfides (pyrite) was worked between 1910 and the 1980s to make sulfuric acid.

The most intense mining activity in the area took place in Etruscan and Medieval times. There are archaeological indications that between the ninth and sixth centuries the sparse settlement system around the Lago dell'Accesa was concentrated near the southern deposits of galena and chalcopyrite at La Speziala and Serrabottini.¹³⁰⁴ Medieval mining, under the control of the *Comune of Massa Metallorum*, has been recorded in the north, with more than 250 known shafts at sites such as Niccioleta, Valle dello Stregaio, Monte Gai, and Val d'Aspra, which all exhibit mining activities beginning in the pre-Roman period. In the western hills, between Poggio Bruscoline and Monte Arsentì, traces of mining activity confirm the mention of pits in Medieval documents, and metallurgical waste. To the southwest, between Podere Altini and La Speziala, there are both pre-Roman shafts and more regular Medieval pits, the latter often encased with stones, with cuts in the walls for platforms and winches. In the east, between Poggio al Montone and La Castellaccia, there are shafts that are up to 0.9 m in diameter and 40 m in depth (Fig. 25.6).

with regular courses of roughly hewn stones. Although many have been filled in, some have been explored and surveyed, with initial on-site inspections indicating that the vein was worked using vertical and parallel shafts from the surface.¹³⁰⁷

The Etruscan presence around Lago dell'Accesa consists of small, separated Iron Age (late ninth and eighth centuries) cemeteries at Fosso di Sodacavalli and at Campo Nuovo, which have not yet been associated with settlements. The origins of the local community more properly lie in the late seventh and early sixth centuries, when it is possible to recognize groups of houses apparently occupied by people connected with mining activities in the Serrabottini area. Giovannangelo Camporeale, who has dug at Macchia del Monte, has determined that metallurgical activity occurred near the shafts, and has proposed that the inhabitants of this quarter were high-status people with links to Vetulonia, approximately fifteen kilometers away. Pieces of sulfide minerals found in the walls of houses suggest a moderate level of sulfide reduction at the site, and the additional presence of iron slag makes smithing plants highly probable, especially in Sector C.¹³⁰⁸

A detailed picture of the organization of mining and metallurgical activities in the territory of Vetulonia has yet to be drawn, although surveys along the upper Val di Bruna, around Castel di Pietra (Gavorrano), have revealed the outline of a dense pattern of open sites, with evidence of a direct relationship between local quartz seams rich in polymetallic sulfides and smelting activities to extract copper, and perhaps silver, in the mid seventh and sixth centuries and again in the fourth, when this district appears to have come under the control of Populonia. This change in political control can be linked to the network of fortified hilltops in the Scarlino, Vetulonia and the Sassofortino areas, which was aimed at securing long-term control of ores in the Val di Pecora and Val di Bruna.¹³⁰⁹

6The Monti della Tolfa (Roma) mining district

A third district worthy of mention is Monti della Tolfa (Allumiere and Tolfa), in northern Latium. Although our level of knowledge of mining in this area could be improved, it is clear that the massive quantity of alunite deposits here was subject to extensive open-air mining in the Renaissance, when quarries were controlled by the *Reverenda Camera Apostolica*, the office in charge of the mining and trade activities of the Holy See and that mining continued until the invention of artificial alunite in the eighteenth century.

The impressive extant remains of quarries in the Monti della Tolfa district await proper archaeological investigation. Surveys in the 1980s, however, shed light on Medieval mining and metallurgy, which focused on the exploitation of copper and lead sulfides with presumably concurrent activities

to obtain iron from gossan deposits.¹³¹⁰ In 2010, several ancient stone hammers were discovered in the waste material of a seventeenth-century copper and lead sulfide mine at Poggio Malinverno, indicating the occurrence of mining activity between the Chalcolithic period and the Early Bronze Age. A concentration of Proto-Villanovan sites in the alunitic and polymetallic mining area, along with the presence of hoards at Tolfa and Coste del Marano, give the general impression that there was a reasonable level of mining and metallurgical activity in the Final Bronze Age, followed by a period in which the Etruscan relationship with metallic and non-metallic ores is still unclear.¹³¹¹ From the eighth century on, the local settlement system, which consisted of centers on tufa plateaus and open sites, was more concerned with agriculture and cattle breeding than with the exploitation of local ores. An absence of fortified hilltops (like the Monte La Tolfaccia hilltop, abandoned in the mid seventh century), as well as a lack of open sites and mineral waste near the seams, makes the working of ore highly doubtful; the recent discovery of iron slag inside the walled coastal center of La Castellina del Marangone (Santa Marinella) is insufficient to indicate hard mining in the Monti della Tolfa district, as some of the ore is hematite from Elba mines.¹³¹²

Very recent discoveries have suggested that mining activity in *Etruria mineraria* ceased between the second half of the second century BCE and the first decades of the first century CE. The metallurgical site at San Bennato (Rio Marina) on Elba was abandoned at the beginning of the first century BCE; the metallurgical workshops along the coast of the Golfo di Baratti and the Golfo di Follonica (Poggetti Butelli and Prato Ranieri) did not survive beyond the middle Republic; and the relationships between settlements, mining areas and metallurgical sites in the Monti di Campiglia seem to have ended in the first century BCE.¹³¹³ Most local Italian mining appears to have been reorganized in response to the mass production activities in the Empire's western provinces, which were rich in sulfide ores, such as *Baetica* and *Hispania Tarraconensis*. Recent surveys in the Colline Metallifere demonstrate persistent mining and metallurgical activity—albeit on a different scale—between the end of the first century BCE and the second century CE, which was aimed at obtaining copper, possibly silver, and certainly iron from local gossan deposits. These surveys also bring to light records of smelting processes at individual sites like Ficarella (Monterotondo Marittimo), which stretch to the fourth century CE and offer local foundations for Early Medieval mining and metallurgical activities from the fifth to the tenth centuries.¹³¹⁴

26The mines on the island of Elba

Abstract: The metal resources of the island of Elba have always been a relevant factor in the history of the surrounding communities, down to recent times. Copper outcrops, though present on the island, were too small to support a significant output, while the iron mines in eastern Elba were renowned for their plenty and continued to be worked until 1981, supplying the entire Tyrrhenian Sea area and beyond with iron. Control, exploitation, and trade of Elban iron influenced local settlements and the environment and, on a wider scale, the economy and international politics. Most archaeological evidence on the ancient mines was lost during modern exploitation. Chronological, technical, and quantitative information on iron production on Elba can no longer be retrieved by direct observation. It is therefore necessary to turn to indirect evidence. The appearance of Elban iron ore (when a reliable attribution is possible) in dated contexts yields chronological hints, together with the establishment of iron workshops at Populonia and the surrounding areas. A structured and continuous exploitation seems traceable only to the late seventh century, possibly in connection with foreign (Greek? Phoenician?) initiatives. The hypothesis of Populonian control of the mines from the beginning is sensible but lacks positive evidence, as does the suggestion of pan-Etruscan (mainly Caeretan) management. The “industrial building” at Populonia implies a continuous input of Elban ore from the sixth century. Sixth–fifth century materials on Elba indicate a shift of settlement toward the mining zone. After the Syracusan incursions in 453–452 a system of hilltop fortresses was established probably by Populonia to protect the mines and the related settlements. Romanization beginning in the early third century provoked a dramatic change in the area’s iron industry. An impressive amount of smelting activity (which caused increased exploitation of the Elba mines, possibly using slaves) covered the shores of Elba and the mainland with slag heaps amounting on the island to more than 100,000 tons, dating from the late third to the first centuries. The location of the workshops aims at the fullest exploitation of wood resources. Diodorus Siculus gives a vivid picture of this intensive activity, which involved the whole Tyrrhenian area. By the first century, mining and smelting were greatly reduced and limited to local needs. On Elba, ironworking sites gave way to luxurious *villae*. The memory of the glorious times survived in the works of geographers (Pliny the Elder) and poets (Rutilius Namatianus).

Keywords: Elba, copper, iron, mines, smelting

1A geomorphological sketch

In a schematic geomorphological description, Elba may be divided into three zones. On the west, the huge granite spur of Monte Capanne, which rises 1,019 m above sea level, is covered with extensive forests and contains several granite quarries, some of which were active in Roman and medieval times. The center of the island (from Marina di Campo to Portoferraio) lies between two isthmuses and is formed by a system of low rises and hills with

alluvial plains. The eastern zone stretches from Capo Vita on the north to Monte Calamita on the south and is divided in two by the isthmus of Mola. It consists of a range of steep, rocky cliffs where almost all the iron deposits on the island occur. A reconstruction of the geological evolution through a sequence of five units (“Trevisan’s complexes”) was proposed in the 1950s and has recently been discussed and updated.¹³¹⁵

2 Mines and metals

We deal here only with metals exploited in the ancient world, which for Elba means copper and iron.¹³¹⁶ A general reappraisal of mineral deposits on the island was published in 1991¹³¹⁷ and is still the main reference.¹³¹⁸

Copper exists on Elba as native metal, oxide, carbonate, and sulfide. Small cupriferous veins occur all over the island, but Elba bears no major copper resources. Suggestions by nineteenth century mining engineers¹³¹⁹ to reopen an “ancient” copper mine at Santa Lucia had no actual consequences. In fact, no copper has been excavated on the island in modern times. From west to east, copper is found at Pomonte Ogliastra– Punta Massellone, Le Tombe – Fetovaia, Acquacalda, Monte Perone, Santa Lucia – Colle Reciso – Monte Orello, Volterraio, Monte Calamita, and Cima del Monte.¹³²⁰ Other records of veins of native copper or chalcopyrite mention Maciarellino¹³²¹ and several sites around Pomonte (Buca del Rame [“Copper’s Cave”], San Bartolomeo).

Iron is found as oxides (hematite and magnetite), sulfides (pyrite), and hydroxides (limonite, goethite) and occurs almost exclusively in the eastern part of the island (Fig. 26.1a). A peculiar clay (*bolo*) was also collected in the iron mines and was used as a medicine;¹³²² healthful effects were credited to a mineral spring below the iron mountain at Rio Marina.¹³²³

Beginning in 1853, several iron mines were opened or re-opened from Rio Albano to Monte Calamita;¹³²⁴ before that, only the high-quality hematite deposits of Rio Albano and Rio Marina had been exploited.¹³²⁵

3 History of research

Ancient authors (e.g. *Mir. ausc.* 93) already realized that mineral exploitation on the island had a long and complex history, but reliable evidence of ancient mining on Elba began to be collected and discussed only in the eighteenth and nineteenth centuries.¹³²⁶ True historical interest grew beside utilitarian aims. In fact, tracing the exploitation of a mine back to remote times legitimated new investment:¹³²⁷ veins of ore exploited by the “ancients” could be followed with modern mining methods, yielding a successful enterprise.¹³²⁸ But while investigations on the mainland actually led to the recognition of

ancient and medieval excavations,¹³²⁹ on Elba ancient workings remained largely unknown, due to uninterrupted activity in the mine of Rio, which was carried out through open-pit digging beginning in the sixteenth century, and later also with gunpowder.¹³³⁰ Old galleries were occasionally brought to light, but none of them were conserved or scientifically documented.¹³³¹ These caves are simply referred to as “ancient”; sometimes an approximate length (1/4 mile) is given.¹³³² The ancient dumps near the mines were also exploited¹³³³ without any archaeological control.¹³³⁴ Other information derives from objects found among the slag heaps occasionally excavated on Elba, again with almost no scientific recording of data.¹³³⁵

The growing importance of the iron mines of Elba in nineteenth- and twentieth-century Italy was both economic and symbolic, connecting the future of the new nation to its glorious past.¹³³⁶ In 1938, when all the mineral resources of Italy were put under intense exploitation, a comprehensive volume traced the history of the mines of Elba “since the Etruscans.”¹³³⁷

The recovery of slag at Populonia in the first decades of the twentieth century¹³³⁸ stimulated new multidisciplinary investigation of the mineral resources of ancient Etruria.¹³³⁹ While evidence on the mainland since then has been the object of renewed interest, the iron mines of Elba—which were still active at that time—have received less attention.

The discovery in the 1960s on the island of Ischia of a fragment of hematite¹³⁴⁰ stimulated new interest in ancient metal exploitation in Elba and Etruria. In fact, excavations on Ischia were bringing about the recognition of the role of the Pithekoussan community (which did not comprise Euboeans only) as the starting point of Greek colonization and trade in the West. The evidence from Ischia revealed a connection between the mineral resources of central Italy (including Elba mines) and Greek expansion in the Tyrrhenian Sea.¹³⁴¹ Meetings,¹³⁴² exhibitions,¹³⁴³ and reappraisals¹³⁴⁴ were therefore focused on *Etruria Mineraria*. Excavations at Populonia brought to light a building of the sixth–early third centuries, where Elban iron ore was smelted and worked.¹³⁴⁵ Excavations¹³⁴⁶ and surveys¹³⁴⁷ were also carried out on Elba, extending to the Middle Ages,¹³⁴⁸ which allowed a careful reexamination of archaeological data published in local contributions.¹³⁴⁹

Research carried out in recent decades at and around Populonia by a multi-institutional team has been widening our knowledge of ancient Populonia,¹³⁵⁰ and throwing light on the phase of copper metallurgy that preceded iron exploitation.¹³⁵¹

On Elba, a late Republican (third–first centuries) ironworking site was discovered at Cavo (Rio Marina) in 1999;¹³⁵² a mold of the hearth is displayed in the Antiquarium of Rio nell’Elba, along with slag, ore, and tuyère fragments from other Roman and medieval ironworking sites.

Mineral exploitation and human settlement on the island of Elba from antiquity to the Middle Ages are currently being investigated by a multidisciplinary team (the “Aithale project”).¹³⁵³

4 Scattered remarks on metal exploitation and production on Elba

4.1 Copper

The literary allusion to copper mining occurring in remote times (*Mir. ausc.* 93) is paralleled by the archaeological evidence. In fact, the presence of people of the Eneolithic culture of Rinaldone in the heart of the mining area of Elba (Grotta di San Giuseppe, Rio Marina)¹³⁵⁴ testifies to their precocious interest in the metal resources of the island, with pride of place, of course, going to copper.

Human presence intensified from the Late Bronze to the Early Iron Age, according to several bronze hoards from the island,¹³⁵⁵ which were found in close relationship with copper outcrops (Fig. 26.1a), though the latter are of minor extent.¹³⁵⁶

Bronze objects and burial rites show parallels both with the mainland and with Sardinia and Corsica,¹³⁵⁷ suggesting that people traveling between the islands and the Italian peninsula played a major role in the spread of metallurgical knowledge in Elba.

Even the smallest chalcopyrite outcrop would not escape the expert eye of prospectors acquainted with copper metallurgy in Sardinia or the Campigliese; indeed, analyses on bronze objects from Cima del Monte testify for their Sardinian origin.¹³⁵⁸ The small amount of available metal suggests that copper exploitation on Elba played only a supplementary role beside other activities.¹³⁵⁹

This scheme is reflected in the Pseudo-Aristotelian text *Mir. ausc.* 93.¹³⁶⁰ The chronological sequence starts with copper production for local needs, followed by a considerable pause and, finally, by the *paradoxon* (tale of marvels) of iron exploitation in the same mine. Actually, copper veins do occur on Elba among iron ore deposits (e.g. at Monte Calamita or Rio), though never in large amounts. The Pseudo-Aristotelian idea of a “real” copper mine is therefore influenced by the later, impressive appearance of iron mines and possibly by the abundance of copper in *Etruria Mineraria* as a whole. It has been suggested that Etruria controlled and took advantage of Elba’s copper resources, while iron production was directly managed by Populonia.¹³⁶¹ Self-sufficiency based on Elba’s copper outcrops makes sense only if it referred to the needs of the inhabitants of the island; it seems therefore possible that the heavily abridged Pseudo-Aristotelian paragraph distinguished between a (remote) time when Elban people directly managed the copper on the island, retrieving enough of it to satisfy their needs, and the time of the author of the tale (Timaeus?), when iron mining was the bulk of mineral production on the island, under Populonian rule. Two features should be noted: the long time between the exhaustion of the copper mine and the

reopening of the iron mine; and no mention of the inexhaustibility of iron mines (a major theme in later ancient literature), even though the tale would offer an appropriate context.

Fig. 26.1: Map of the metal resources on the island of Elba

4.2Iron

4.2.1 The Etruscan period

Since ancient mines and dumps at Rio have been lost in modern exploitation, indirect information is needed to date the initial phases of iron production.

Tracing back the first appearance of (true) Elban hematite in reliable archaeological contexts is a sensible method, though ore provenance should always be controlled through specific analyses. Recent research has discovered that high tin and tungsten contents mark the hematite from Elba, thus yielding a tool for tracing the diffusion of Elban iron ore.¹³⁶² Elban hematite has recently been discovered in reliably Palaeolithic contexts near Livorno and near Lake Bilancino (Florence), of course not for metallurgical use.¹³⁶³ Ore from the lowest levels in the “industrial building” at Populonia dates to the first half of the sixth century.¹³⁶⁴ Hematite from Pisa¹³⁶⁵ and San Piero a Grado¹³⁶⁶ comes from late seventh–early sixth century contexts; a slightly lower chronology is suggested for the iron ore at Rondelli–Follonica.¹³⁶⁷ On Ischia the ore from “Scarico Gosetti” comes from a disturbed context, and the slag found in an eighth-century layer in the necropolis of Lacco Ameno cannot be linked with certainty to Elban ore.¹³⁶⁸

Iron objects from Populonia testify to the spread of iron technology in the area¹³⁶⁹ and to the exploitation of local resources (possibly including the ore deposits of Monte Valerio, on the mainland). Iron was not common in the early phases of the necropolis of Populonia,¹³⁷⁰ but it was used for ornamental purposes (iron inlay in bronze sheet) as late as the middle of the seventh century.¹³⁷¹ Other parts of Italy (e.g. Calabria) were more precocious, adopting iron for utilitarian purposes as early as the ninth century.¹³⁷² The existence of large iron ore deposits on Elba does not seem to have stimulated an autonomous early transition to iron-based metallurgy in the area.¹³⁷³ External influence may therefore be traced through several distinct—possibly interconnected—paths, involving Greek (Euboean-Pithekoussan), Phoenician, and Sardinian prospectors and traders, in the context of a well-developed local copper-based metallurgy.¹³⁷⁴

The stratigraphy of Porto Baratti at Populonia, where slag accumulated for centuries, may enlighten the early phases of iron exploitation. At the bottom of a cliff running along the seaside,¹³⁷⁵ large slag cakes deriving from copper smelting were recorded, dating to the ninth–eighth centuries.¹³⁷⁶ Atop this layer, some iron slag appeared mixed with copper slag, earth, and charcoal, with a C14 chronology from the eighth and seventh centuries. Copper slag disappears, and iron slag becomes more frequent in the upper layers.¹³⁷⁷ These data will be verified through further investigations in other portions of the slag deposit at Porto Baratti.

Even admitting a late-eighth-century date for the “discovery” of the iron

deposits of Rio,¹³⁷⁸ positive evidence of systematic exploitation is consistently later.¹³⁷⁹

The status of the iron mines in these early phases is obscure. Evidence of a structured community on Elba—able to manage the local metal resources—is elusive. Populonia is said to manage the “new” iron mine in *Mir. ausc.* 93;¹³⁸⁰ garment accessories from seventh–sixth century tombs at Madonna del Monte (Monte Capanne, Elba) point to Populonian settlers.¹³⁸¹ However, political control of the island (and of the mines) by Populonia at this early time needs stronger evidence.¹³⁸² It is certain that in the early sixth century, Populonia created an industrial complex for ironworking at Baratti, which presupposes a continuous supply of iron ore.

Several sparse hints thus converge to indicate a Populonian initiative in improving iron production at least as early as the sixth century. This may be due, of course, to internal developments at Populonia that moved the balance of the local economy toward a manufacturing industry, (and iron production at Populonia and elsewhere in Etruria has been recently connected to aristocratic groups since the first half of the sixth century)¹³⁸³, but external influence should not be excluded. It is worth noting that the beginning of regular iron production coincides with the acme of Phocaeen and Ionian *emporia* in the West. This is the time of the first known mention of Elba in Greek sources—by Hecataeus of Miletus. Phocaeans in particular were credited with “opening” the sea routes of the western Mediterranean (Hdt. 1.163), and it is tempting to connect the location of Elban iron mines—almost directly on the sea—to the high grade of Elban hematite (which made the raw ore trade profitable),¹³⁸⁴ and the traces of Ionian (Phocaeen?) influence in the material culture of Archaic Populonia.¹³⁸⁵

We cannot guess at the amount of iron worked.¹³⁸⁶ The quantity of slag dated with certainty to the Archaic period (from Populonia “Edificio Industriale,” Rondelli, and a few other sites in the neighborhood, but not yet Elba)¹³⁸⁷ appears significantly smaller (on the order of hundreds of tons) than the huge heaps from Roman times (hundreds of thousands of tons).¹³⁸⁸ Though small, in the sixth–fifth centuries, several ironworking sites were already spread along the Tyrrhenian Sea. We do not know how much they relied on Elban iron and/or other sources of iron,¹³⁸⁹ and only analyses of ore and slag will give an answer. This is the case, for example, of the iron ore found in a fifth-century context at Genoa and at Aleria (Corsica), which is generally identified as Elban hematite without specific analyses.¹³⁹⁰

There is a shift of the human settlement on Elba towards the eastern, iron-mining area in the sixth and fifth centuries (Fig. 26.1b–c). An Archaic bronze statuette of an offerer,¹³⁹¹ together with some of the Classical tombs so far discovered on Elba, attest to a moderate local wealth, possibly connected to iron mines.¹³⁹² From the second half of the fifth century, a system of hilltop fortresses was established on the island, probably under Populonian control¹³⁹³ and mainly in the most populous, central-eastern part of the island.

This suggests an increased importance of iron exploitation, which became a strategic resource in a wider Tyrrhenian area. At Populonia, smelting and refining activities were carried out in the “industrial quarter” from the sixth to the early third centuries¹³⁹⁴ and near the Baratti shore, where recent excavations have brought to light smithing forges dating from the fourth to the second centuries.¹³⁹⁵

The iron mines of Elba may have been the real target of the double naval expedition by Syracuse in 453–452 (Diod. Sic. 11.88.4–5), though Diodorus refers only to the repression of Etruscan piracy.¹³⁹⁶ The number of ships (sixty) and the distance from Sicily long remained unparalleled in Syracusan history. This highlights the importance attributed by the Sicilian *polis* to the direct control of Elba and its iron mines, a resource almost totally lacking in Sicily. A further expedition under Dionysius the Elder in 384 supports this view. The anecdote of the Sicilian merchant (in Arist. *Pol.* 1259a)—the first documented attempt at an iron monopoly, under Dionysius the Elder—gives the figure of fifty talents to indicate the value of the iron purchased. This number has been seen as the amount of iron annually bought by Syracuse,¹³⁹⁷ thus giving a figure for the annual output of the main source of iron ore, the Elba mines. This statement should be reexamined, however. Traces of Syracusans on Elba are scanty but suggestive: the *Portus Longus* (*Peutinger Table* 2.4–5)—Porto Longone, later Porto Azzurro—mirrors Greek place names in northeastern Sicily;¹³⁹⁸ the myth of the Argonauts on Elba has also been connected with Corinthian (i.e., Syracusan) traditions;¹³⁹⁹ the “*Hellenes hoi ten neson oikountes...*” mentioned by *Mir. ausc.* 105 (Timaeus?) were perhaps the descendants of the Syracusan garrison.¹⁴⁰⁰

4.2.2 The Roman period

Traces of a change in the iron industry at Populonia after the Roman conquest (early third century) may be seen in the abandonment of the “industrial quarter” at Baratti¹⁴⁰¹ and in the establishment of several large ironworking sites on the Tyrrhenian coast¹⁴⁰² and on Elba. Since these slag heaps were almost totally destroyed during slag-retrieval operations in the 1930s and later,¹⁴⁰³ only an approximate date (early second–early first century) can be given for this massive ironworking phase.¹⁴⁰⁴

More than 100,000 tons of slag were recovered on Elba;¹⁴⁰⁵ on the mainland, the ironworking site at Poggetti Butelli near Follonica is estimated to have held around 500,000 tons, while the amount of slag at Populonia is debated but seems to be consistently larger.¹⁴⁰⁶

This means that iron ore excavation on Elba underwent a dramatic increase under Roman rule, possibly through greater use of slave manpower. A clear explanation for this change continues to elude us, although it seems likely that Populonian control of the Elba mines weakened,¹⁴⁰⁷ and private enterprises (*publicani*) made free use of the mineral and forest resources of the island and

the mainland. Possibly, one of these entrepreneurs was that Aulus Vettius who scratched his name inside a third century BCE black glazed bowl that was found in the sea at Cavo, near the iron mines and in front of an ironworking site.¹⁴⁰⁸

Tomb assemblages in the Hellenistic-Roman cemeteries of Elba suggest that both slaves and freedmen were employed in the mines and related jobs.¹⁴⁰⁹ New ironworking sites were created up and down Elba's coast (Fig. 26.1c),¹⁴¹⁰ even at the western end.¹⁴¹¹ These factories were located on the sea, near an anchorage for ore transport facilities. They relied on water from small streams flowing nearby, and usually had a valley behind them that furnished charcoal for metallurgical furnaces. Roof tiles, amphorae, and ceramics found among the slag during the surveys and the excavation at San Bennato and San Giovanni¹⁴¹² hint at permanent settlements.

The location of these ironworking sites aimed at the fullest exploitation of the island's forests. In fact, the only factor limiting the amount of iron that could be produced was the quantity of available wood and charcoal. Woods in the area were severely damaged by this large-scale manufacture, which impressed the ancient writers. Diodorus Siculus (5.13.1–2) devotes the entire chapter on Elba to the ironworking process, describing the large amount of iron available and exploited, the crushing and smelting of ore, the technical properties of the furnaces, and the fact that the metallurgical treatment was limited to smelting, producing unrefined iron in the form of large “sponges.” A complex network of factories and trading points that spread across the Tyrrhenian Sea but was centered on Puteoli (Pozzuoli), brought Elban iron—in the form of finished objects—almost everywhere. This system distributed the environmental¹⁴¹³ and economic problems connected with charcoal production to a wider area, since every step of the ironworking process (from smelting to refining to forging and shaping) was located in a different place.

The establishment of this operational chain dates at least to the Second Punic War, when Scipio (in 205) asked his Etruscan allies for the raw materials to build and arm a fleet for his expedition to Africa. Populonia gave iron, while weapons and implements—possibly made of the very same iron—were presented by Arretium (Livy 28.45.15–16).¹⁴¹⁴

Analyses of slag from Roman ironworking sites on Elba confirm that the metallurgical treatment of iron ore was limited to smelting.¹⁴¹⁵ At Populonia, coastal excavation has brought to light some refining forges dating to the fourth–beginning of the second centuries, while a huge accumulation of smelting slag occurs immediately after.¹⁴¹⁶ The impact of mining and metallurgy on the Italian environment, the fear of further slave rebellions after Spartacus, and attention to sparing the resources of Italy for future needs moved the Senate to promulgate a *senatusconsultum*¹⁴¹⁷ in the first century forbidding mineral exploitation in Italy. At the same time, several authors mention the iron mines of Elba for the *paradoxon* of their inexhaustibility. Elba was Italian soil, but Strabo (5.2.6) saw active Elban iron mines (though

ironworking on the island had ceased), with the ore laded directly from the mine and brought to Populonia for smelting. Elban iron mines were not definitively closed, possibly because iron had a special status for strategic reasons, or because they really were supposed to be nearly inexhaustible.¹⁴¹⁸

4.2.3 Epilogue

We do not know how long the Elban iron mines remained active after Strabo's observation. Excavations at Baratti-Populonia clearly show an end to large-scale metallurgical activity by the middle of the first century¹⁴¹⁹ and a transition to a modest production system based on *villae* that was aimed at local needs.¹⁴²⁰ The routes of the iron trade—at least those that led to the Roman army—no longer crossed the waters of Elba, but followed the Rhône toward the German *limes*.¹⁴²¹ It is suggestive that steel implements used in Vetulonia were purchased in Noricum in the first century CE.¹⁴²² Though Virgil (*Aen.* 10.173), Silius Italicus (6.613–16), and Pliny the Elder (*HN* 3.81, 34.142) still mention the iron mines, they refer to past ages, or use a literary *topos* associating Elba with *ferri metalla* even though these were no longer being worked. Rutilius Namatianus (1.351–66) praises the poor, honest, and fertile iron of Elba as the symbol of an old world that had collapsed under the blows of the barbarians or had been weakened by the Christians. The mines had entered legend.

27Coins and mints

Abstract: The production of coins in Etruria is linked to the individual city-state, following a model imported from Greek civilization. The Greek model is the Syracusan, for both typology and weight, and was the basis for the oldest coin production in the areas of Vulci and Populonia between the end of the sixth and beginning of the fifth century bce, and then continued at irregular times and rhythms. The bronze Italic and Latin coins of a calibrated weight, with denominations in duodecimal divisions, on the other hand, served as the model for the mints of Etruscan centers, from Volterra to Tarquinia and perhaps Arezzo-Cortona-Chiusi in periods when Roman coinage became familiar.

Keywords: Populonia, Vulci, Tarquinia, Volterra, Arezzo

Introduction

In Etruria, the production of coinage developed within individual city-states, following the Greek model. The use of coins in commercial exchange certainly came about later than in the Greek world, but a century earlier than in the Roman world. Nonetheless, as regards Etruscan coins, we must ascertain the quantity and the continuity of production across the different periods.

The earliest experiments with coinage are found in the economic and cultural environments of Populonia and Vulci. As for Populonia, the historical and archaeological evidence agree that it was fully involved in the maritime traffic on the Tyrrhenian Sea in the mid sixth century BCE, thanks to its hegemonic position in the exploitation of metalliferous resources not only on the island of Elba but also in the hinterland of Campiglia Marittima.

Vulci's commercial role—which developed throughout the sixth century and during much of the fifth—must be stressed as a center of receipt and transshipment of luxury goods toward neighboring Etruscan centers and those of more inland Etruria. The Vulci area is assigned four different series of silver coins with the legends *Thezi* and *Thezle* (produced on a base weighing 5.80 g), showing a winged Gorgon on the run, a sphinx, and a hippocamp, for a production dated—not very confidently—to the first half of the fifth century. The names in the legends, rather than being derived from names of cities, could be derived from the gentilics of persons responsible for the quality of the production and representing the issuing authority—that is, the city-state—*itself*. In Etruscan coinage some standard weights have been used ([Table 1](#)).

Table 1.: Standard weights used by Etruscan cities

Standard weight	Theoretical weight	Value	Series	Chronology
Asia Minor	g 5,80	unit and two units	Thezi-Thezie	First half 5th cent. BCE
Euboean-attic	g 8,7	From 1 to 10 units	Gorgon's head X	Half 5th cent. BCE
Euboean-attic	g 17,44	unit, 2/3 and 1/4	Wild boar, Chimera, Sea lion, Lion's head	5th cent. BCE
Euboean-attic	g 17,44	from 1 to 20 units	Gorgon's head, XX	First half 3rd cent. BCE
Roman libra	g 293,26	duodecimal	Tarquinius	Late 4th-early 3rd cent. BCE
Roman libra	g 206,66	duodecimal	Heavy series of the wheel and heavy series of the sacrifice	First half 3rd cent. BCE
Roman libra	g 151,60	duodecimal	Volterra and light series of the wheel	First half 3rd cent. BCE

1Populonia

In the case of Populonia, the first experiment with coinage consisted of small denominations in silver (supposed weight of 0.69 g), which were found, together with a small idol and bars of the same metal, in a hoard near the walls of Volterra in 1868. Of the sixty-five coins found, a small number have recently been judged to be the product of the Greek city of Massalia and a large number a product of Populonia itself, confirming the existence of active commercial traffic with the entire Etruscan Tyrrhenian coast from the end of the sixth to the beginning of the fifth century.¹⁴²³

After a period of inactivity that lasted a couple of decades, Populonia turned to striking other coins in silver, some of which are linked to the old base weight of 5.80g, while others were produced on a new base weight derived from the Euboean-Attic stater (= tetradrachm) of 17.44 g, a standard spread through southern Italy by the Greek colonies on Sicily. To the first group are assigned two series of various values featuring either a lion's head or a lion with a sea monster's tail ([Colour plate 1](#)); to the second, other series featuring wild boar ([Colour plate 2](#)) and chimera ([Colour plate 3](#)). All the series have one blank side that bears no mark at all.

Limited production restricted to high values and a restricted area of

circulation are thus the characteristics of the first experiments with money in the Etruscan cities, similar to what had happened in the Greek cities of Greece itself and the colonies of Magna Graecia and Sicily, which had provided the very idea of money.¹⁴²⁴ This production cannot be justified by the needs of domestic or international commerce, in comparison with the territory of each city-state. For this early period, a few scholars have suggested that the production of coins was dictated by a policy of acquisition and payment within gentile groups rather than within a governmental authority.

The oldest Etruscan public coinage, again linked to Populonia, seems to be represented by a series of various values in silver and gold, among which is the example with the Gorgon's head and a denomination marked as X (Colour plate 4). An example of this series in silver has been found near Como in an archaeological stratum securely dated to the third quarter of the fifth century (450–425).¹⁴²⁵

The dating confirms earlier intuitions derived from notes on historical events in the city. Intensive metallurgical activity in Populonia, in fact, really intensified in the fifth and fourth centuries such that in the middle of the fourth century, Populonia had established a monopoly on the production and export of iron from the island of Elba.¹⁴²⁶ The development of an internal market with the associated expenses and payments might have favored recourse to money, which by this time was not limited only to high values but provides examples of low values in reasonable quantity.

A series in gold consisting of three denominations valued 50, 25, and 12.5 features the design of a lion's head with gaping jaws (Colour plate 5). With a nearly perfect correspondence of weights and values, this series corresponds with a gold series from Syracuse from the period of the tyrant Dionysius I (405–367), which would provide a contemporary date for the Etruscan pieces.¹⁴²⁷ Other values in gold of various designs, featuring male and female heads, the Gorgon head, and the hippocamp, seem to be part of the same system linked to the Populonian environment.

After an interval of time that we are not yet in a position to specify, Populonia again began to produce silver and bronze coins with a group of issues numerically more consistent and design articulated more logically. The most common value (more than 1,000 examples of some forty different coins) is the silver stater with the Gorgon's head, with a makeup quite similar to the preceding but marked with the value XX (Colour plate 6). The reverse shows various designs that are often accompanied by a legend with the name in the form *Pupluna* or *Puplana*. The precise correspondence of the weights with the older series, but with a different sign of value, suggests devaluation by halving the value of the denomination, the motivation of which remains unknown.

There are two other silver series with the same signs of value. The first features a beautiful helmeted three-quarters head of Athena, with the legend *Pupluna* on the reverse, and the second, a full-face head of Hercle-Heracles

capped by a lion skin and either a club or no design on the reverse (**Colour plate 7**). At least the head of Menrva-Athena finds an exact typological and chronological comparison with a similar type, which appears on the tetradrachm of the mint of Syracuse, signed in the die by Eucleidas and assigned to the last years of the fifth century.¹⁴²⁸

This phase of production in Populonia is characterized by a wider and lively circulation of coins. Indubitable evidence is a few hoards found in the territory directly dependent on the city, which is closely connected with the ever-greater involvement of money in the social and economic life of Populonia. Confirming this, in the area of the same mint, are some series minted in bronze featuring the legend *Pupluna* or *Pufluna*, with the head of a god and each god's respective symbols (Menrva-Athena, owl; Turms-Hermes, caduceus; Hercle-Heracles, bow, arrows, and club; Sethlans-Hephaestus, hammer and tongs). These also reflect the reduction in weight and various chronological periods, though they are never very far from the middle of the third century.

A dozen series minted in bronze are characterized by reverses with punched figures (**Colour plate 8**), a peculiarity that places the series in a group by itself but still within the field of Etruscan—and although the date of circulation is yet to be confirmed, more precisely Populonian—coinage. Such comparison of design and weight appears to show parallelism between some denominations of this Etruscan production (various distinct denominations of the signs of value are distinguished, from 1 to 100 unit) (**Colour plate 9**) with similarities to the Syracusan coinage of the time of Timoleon (345–335), a comparison that might suggest a possible absolute chronology.

2Tarquinia and Volterra

In line with the Italic tradition of cast bronze coinage,¹⁴²⁹ some other Etruscan centers issued cast series of exact weight in various values, assigned according to the duodecimal division of the pound. It seems right to attribute an anepigraphic series—which survives by way of a small number of examples—to the city of Tarquinia, on the basis of its discovery in the territory and from the clear comparison between the designs of the coins (wild boar's head and the letter Alpha), and the subjects of the wall painting of the Tomba dei Pinie (Giglioli Tomb) at Tarquinia, which dates to the last decades of the fourth century—in any case, no later than 300 (**Colour plate 40**). The progenitor, Vel Pinies, might have held the post of magistrate (his magistral insignia are depicted hanging on the walls of this tomb) responsible for the issue. This is entirely in line with the historical fortunes of the city, which after an exceptional dominance over a vast territory, saw a phase of slow but steady decline beginning in the middle of the fourth century, brought about by

Rome's ever-increasing interference. To be specific, the armed conflict with Rome took place in the mid and late fourth century (351–308), until the definitive capitulation of the Etruscan city in 281, the same year when Tarquinia saw part of its territory confiscated (see [chapter 37](#) Marcone).

Volterra's coinage can be placed a few decades later. It was divided into three different series, with denominations from the dupondius to the ounce, and documented by a over 600 examples that have survived. All the denominations with their respective indications of value show a youthful two-faced head (*Culsans* in Etruscan) and the legend in Etruscan letters *Velathri*. This minting must coincide with the period of great development of the city's artisanry, which was closely connected both with the growth of the urban population and the extension of the territory, which was politically and culturally dependent on the city.¹⁴³⁰

The association with other classes of materials and the discovery of Volterranean coinage document its presence for the entire third century, but production might have ceased during the First Punic War. The data in our possession document the persistence of such examples in a family's possession even during the chronological period in which Roman coinage was already in use in markets throughout Etruria.

3Other cities

Other series of coins cast in bronze were produced in centers in interior northern Etruria (Arezzo, Cortona, and Chiusi) based on two different pounds, 151.60 g and 204.66 g, the lighter of which is the same as that used in the Volterra mint ([Colour plate 10](#)).

The first five series features a wheel on the obverse, and either the same type of wheel or a battle-axe, a krater, an anchor, or an amphora on the reverse. Two other series feature the design of an ancient wheel on the obverse, like that which appears on a silver series of one unit attributed to Populonia and either the same ancient wheel or three crescents on the reverse. The last series has another common design for the obverse and one for the reverse: an augur's head facing forward with the typical cap, axe, and hammer, instruments used in the propitiatory sacrifice ([Colour plate 11](#)). Both the anchor series and the battle-axe series would seem to complement two other series in bronze but struck with weights and marks of value identifying them as an ounce, a half-ounce, and a quarter-ounce. Any attempts to attribute an individual series to a specific center on the basis of letters of a particular alphabet have not yet yielded the hoped-for results, but the areas of greatest interest remain the Elsa Valley and the Chiana Valley.

For the best definitions of these cast bronze series, it is indispensable to refer to what some of the cities and communities of central Italy (Ariminum,

Firmum, Hatria, Vestini, Luceria, Venusia, Ausculum, Tuder, Iguvium, and Rome itself) underwent to verify relations of dependency or provenience of the weight units used from time to time and reconstructed by calculating the theoretical weight for each series.¹⁴³¹

As for the two different pounds identified in the study of each example's weight, it seems more logical to believe that they were two pounds of Etruscan origin, and that one might be derived from the other by reduction, rather than imagining an exclusively Roman provenience in a general view of the dependence of all Etruscan and Italic coin production on the Roman model.

It is clear enough for the production of money coined in gold, silver, and bronze, that influences are to be sought in the Greek environment of Magna Graecia and, above all, of Sicily, from which the very idea of money arrived. As for the production of coins cast in bronze, the same is also true of other Italic centers in deference to the Italic, Etruscan, and Latin practice of using bronze-copper as a medium of exchange in unshaped chunks or in the form of ingots or finished products, including coins that in multiples could reach a weight of several hundred grams.

In the group of coins with the legend *Vatl*, attributed to the mint at *Vatluna-Vetulonia*, the series featuring a man's head on one side with the reverse either blank or with a caduceus, which seems to be the oldest that has been found, can be compared stylistically with the depictions that appear on Etruscan red-figure ceramics of the Clusium-Volterrae Group, from the end of the fourth century. There is also a denomination with half the value in a varied series with a male head capped by a conical helmet, and on the reverse, an oar or a rudder. Another series also has two denominations—*sestante* and *uncia*—each with the same design: a male head capped with the remains of a sea monster on the obverse, and, on the reverse, a trident flanked by two dolphins. The findspots of coins with the legend *Vatl* mainly identify a Tyrrhenian circulation, in the territories of Populonia and Vetulonia, in the service of an internal market equipped with limited possibilities of expansion. Vetulonia's entire experience with money is confined to between the end of the fourth and the first half of the third century.¹⁴³²

Three series of coins show a legend *Peithesa*, which is not possible to match to any name of an ancient center, but rather to a gentilic *Peithe-*, which is found throughout the territory of Chiusi. The series have the same reverse, an owl standing with closed wings, and different obverses, a head of *Turms-Hermes*, *Menrva-Athena*, or *Aplu-Apollo*.

Two other series that are anepigraphic, but definitely from the Etruscan sphere, feature designs of the head of a black African accompanied by an elephant (Colour plate 12) and a male head accompanied by a running fox-like dog (Colour plate 13). For all these series, the findspots permit them to be attributed to northern inland Etruria during a period that extends to as late as the end of the third century.

Among our uncertainties, there are some scarce examples with the Etruscan legends *Curt*, *Metl*, or *Vercnas* which, as for *Peithesa*, cannot be referred to names of cities but which, while they should not be regarded as the actual names of the subjects depicted, can be matched to names of gentiles of persons, perhaps those responsible for their monetary production.

Finally, the 1985 find of a hoard of eight coins near Lucca has reopened the debate on the possible existence of a mint at Lucca itself, to which to attribute production, certainly limited, of coins displaying the hippocamp. The town of Pisa could also have operated a mint, albeit briefly, whose activity might coincide with the first decades of the third century,¹⁴³³ during which the other major nearby mints—Volterra and especially Populonia—produce well-evidenced coins with the respective Etruscan names.

The choice of some designs in the dies used for Etruscan coins has attracted the attention of scholars who have sought derivations and explanations of the various cases.

The lion's-head type with gaping jaws and lolling tongue found in the gold series attributed to Populonia seems to find its most direct comparison with the series of silver tetradrachms of the Sicilian mint of Leontinoi. These series are dated to begin in 466 and persist throughout the fifth century. The Etruscan series is definitely more recent but could still go back to the last part of the fifth century.

The three-quarters head of Menvra-Athena of the Etruscan silver series finds an undeniable comparison with the similar type, a model signed by the engraver Eukleidas, which appears in the silver drachma of the mint of Syracuse during the period of the tyrant Dionysius I (405–367). In this case too, the Etruscan issue is certainly more recent by several decades.

A further connection with the Greek environment of Sicily is well in evidence in the structure of the bronze series, consisting of various values from 1 to 100 unit and characterized by the fact that the designs of the reverse are normally incused (formed by punching). The style of some types (the hippocamp, the eagle and serpent, the helmeted head of Minerva, the bearded man's head), the incusing technique, the presence of signs of value, and some comparison in terms of weight have convinced scholars to seek parallels with the Sicilian Greek environment of the time of Timoleon.¹⁴³⁴

In the opinion of some scholars, the male and female heads on the silver series of ten units from Populonia's mint would find comparisons with the similar heads on Campanian coinage, of Neapolis in particular, a product dated to the late fourth century from the types of Etruscan coins which could be derived.

Certainly derived from Greek models is the Gorgon Medusa, the only one of the three sisters to be mortal, whose terrifying head, after having been cut off by Perseus, became the distinctive element of the shield of Athena. Another Gorgon is shown winged and full-length on a different series with the legend *Thezle*, obviously a combination of the other series with the legend

Thezi from the environment of Vulci.¹⁴³⁵

The curious pairing of a black African's head and an Indian elephant on a bronze series has been explained by the presence of Hannibal in Italy and, therefore, by a derivation from external and foreign design models, that is, the rest of the Etruscan, Italic, and Roman coinage.¹⁴³⁶

An indigenous type, distinct from the bearded Janus, is undoubtedly the head with two young faces of the bronze series from Volterra's mint, which finds its best comparison in the full-length bronze figurine of the god found at Cortona, identified by an inscription on the left thigh as *Culsans*.¹⁴³⁷

Another native type is the man's head capped with the remains of a sea monster that distinguishes the series with two values, sestante and oncia, from the mint of Vetulonia. Once the old hypothesis is abandoned of his identification with Heracles or Palaemon-Portunus, he is to be identified with a local divinity or eponymous hero, closely related to the city's maritime activity. It is very likely the same eponymous hero who, representing the *Vetulonienses* is portrayed on a relief dated to the Roman imperial age, probably helmeted and provided with an oar. Another series that also probably comes from Vetulonia consists of two values—uncia and half-uncia—on which the half-uncia features a man's head capped with a conical helmet on the obverse, and an oar on the reverse.¹⁴³⁸

The man's head capped with the remains of a probable wolf, accompanied by a running fox-like dog, a small bronze series, also seems to be a local type from a mint doubtfully from the Chiana Valley.¹⁴³⁹

A hoard discovered in 1985 at Romito di Pozzuolo, near Lucca, contained three examples featuring a hippocamp and five featuring a goose looking backwards. The association with other archaeological materials suggests a latest possible dating to 270, given their issue and possible attribution to the local mint of Lucca.¹⁴⁴⁰ The possible presence of a mint at Lucca in the Etruscan period seems to be confirmed by another coin also belonging to the hippocamp series. This was found at Bora dei Frati in 1988, in the territory of Pietrasanta (Lucca), during excavations conducted in the area of a settlement that has yielded materials dating to the end of the fourth and beginning of the third century, but for this particular coin, a dating around the mid third century is confirmed.

28Weights and balances

Abstract: Studying the bronze weights discovered in Etruria makes it likely that there was a unit of weight equal to 143,5 g (or 287 g), which can be called the “Etruscan pound,” upon which Etruscan coinage was based. The weight system used in Rome, however, was based on a “pound” of 326.16 g. In Etruria, both types of balance used in antiquity, the *libra* and the *statera*, are attested.

Keywords: *Libra*, *statera*, *aequipondium*, weights, balances

1Catalogue

In Etruria, both types of balance used in antiquity, the *libra* and the *statera*, are attested. The former is also documented on the basis of various depictions, but the latter is preserved only in the form of a few components of the instrument, namely, weights.

Type I. *Libra*

- 1.Bologna, Museo Civico Archeologico, inv. no. 169. Stele from Felsina. Second half of the fifth century. Weighing of wool in the presence of the *materfamilias*.¹⁴⁴¹
- 2.Madrid, Museo Arqueologico Nacional, inv. no. 9829. Mirror from the *Kranzspiegelgruppe*. On the reverse, *Aplu* and *Turms*. *Turms* is holding the *libra* to weigh the *kēres* (fates?) of *Achle* (Achilles) and *Evas* (Ajax). Third century (Fig. 28.1).¹⁴⁴²
- 3.Private collection. Conical weight in the form of an acorn(?) for a *libra*(?), with dedicatory inscription. Ht. 3.90 cm; diam. 3.95 cm; 143.9 g. Third century (Fig. 28.2).¹⁴⁴³

Type I A. *Libra* with weights

- 1.Current location unknown (lost?). Krater (*kelebe*) from Montediano (Bolsena). (A) Apollo and Heracles (or Hyacinth?). (B) *Turms* observes *Palmithe* (inscription: *Talnithe*), who holds a *libra* in his right hand, with two roundish objects (stones?) placed on its pans.¹⁴⁴⁴

Tipo II. *Statera*¹⁴⁴⁵

- 1.Chianciano, Museo Civico Archeologico delle Acque. Counterpoise in the form of a two-faced woman. From Chanciano, I Fucoli. Ht. 6.8 cm; 265 g. Late fourth – third century BCE.¹⁴⁴⁶

2. Chianciano, Museo Civico Archeologico delle Acque. Counterpoise with two faces: on one side, a Silenus; on the other, a Maenad. From Chianciano, I Fucoli. Ht. 8 cm; 576 g. Late fourth – third century.¹⁴⁴⁷
3. Rome, Museo Nazionale Etrusco di Villa Giulia, inv. no. 121561. Egg-shaped weight, with dedicatory inscription. From Caere, sanctuary in the Sant'Antonio neighborhood. Ht. 10 cm; 750 g. (Fig. 28.3).¹⁴⁴⁸

The tiny catalogue presented above records the certain existence of the *libra* at least from the fifth century (I.1) and its continued use into the first half of the third century, dated on the basis of the palaeography of the probable weight (I.3) and the style of the mirror with the depiction of one (I.2). The weights (II.1–3), on the other hand, seem to document the existence of the *statera* beginning in the late fourth century; this is a period surprisingly earlier than is usually thought.¹⁴⁴⁹ That they actually belonged to steelyards seems to be proved by their considerable dimensions; counterpoises like those found in Etruria seem to exclude their use with a two-pan balance.¹⁴⁵⁰

Fig. 28.1: Mirror. Madrid, Museo arqueologico Nacional, inv. no. 9829 (from Blázquez 1960)

In fact, even with the *libra*, small counterweights could be used to equalize the weights of the two pans of the balance. Examples are known from the Late Republican or Proto-Imperial period, from Pompeii and elsewhere.¹⁴⁵¹ The balance depicted on the krater from Montediano (I A.1) confirms its existence, moving the date in this case to the Early Hellenism. The interpretation of this piece of evidence, however, remains ambiguous. Does it indicate that the steelyard had its origin in the *libra*, through the development of the system of counterpoises, or else that it was the result of interaction between the older weighing system and the revolutionary balance with just one arm?¹⁴⁵²

Fig. 28.2: Weight in privat collection (from Bonfante 1993)

2The weight system

The facts about weights inferable from the likely *libra* weight appear to be very important. The example in a private collection (I.3) weighs 143.9 g, but the two weights from Chiusi weigh respectively 265 and 576 g; the one from Caere, 750 g. These facts definitely rule out the system of weights in use at Rome, which is based on a pound of 327.45 g (or better, of 326.16 g).

A relationship can be assumed with a degree of certainty between the two weights from Chianciano, since they come from a single context and they exhibit the strongest typological and stylistic affinity. If we take into account the fact that the smaller piece is heavily worn, resulting in a considerable loss of metal a weight can be reconstructed for this piece close to 288 g, a weight that in theory would put it in a 1 to 2 relationship with the larger weight. The definition of this embryonic sequence of weights appears extremely significant in light of the small conical object (I.3) that is tentatively identified as a weight for the *libra*: its weight, ca. 144 g, turns out to be exactly half the weight determined theoretically for the lighter of the two *pondera* from Chiusi. The palaeography of the dedicatory inscription points to the region between Vulci, Tarquinia, and Orvieto for the provenience of the donor (and thus perhaps also of the object). This considerably broadens the area of diffusion of the specific system of weights, which also seems to have involved some of the city-states of central-southern Etruria.

Fig. 28.3: Weight from Caere (from Cristofani 1996)

Contact with the series of weights from Caere (750 g) proves to be more problematic. But if we take the lowest value as the basis of the system, that of example I.3 rounded off to around 145 g, the Caere weight comes out to five units plus a remainder of 25 g, which appears excessive given that these are objects of controlled weight, perhaps even reference standards kept in sanctuaries, a very unsatisfactory circumstance. But the example from Caere, unlike those from Chiusi, which have a single suspension hole, has a second ring coarsely attached to the main one. If we estimate the weight of the second ring (which is not found in the other examples) at 25 g and subtract it from the total weight (750 g), we arrive at ca. 725 g, which corresponds exactly to quintuple the base measure. This sequence emerges:

Weight in private	= 1	= 144 g
collection (1.3)		

Weight from Chianciano = 2	= 288 g
(II.1)	
Weight from Chianciano = 4	= 576 g
II.2)	
Weight from Caere (II.3) = 5	= 725 g
	(+ 25 g)

Or, if we take the base to be 290 g,	
I.3 =	0.5
II.1 =	1
II.2 =	2
II.3 =	2.5

Although we should perhaps wait for documentary confirmation, nonetheless this result appears very attractive. In fact on a base of 145 g (or 290 g), which we might call the “Etruscan pound,” is conceived a series of Etruscan bronze coinage (see [chapter 27](#). Catalli), from both Volterra and much of central Etruria, and even some from Tarquinia. Deepening research has made it possible to construct a table gathering the weights in stone and metal attested in Etruria ([Fig. 28.4](#)).¹⁴⁵³

Fig. 28.4: Weights from Etruria (from Maggiani 2007, 147); all chronological indications are BCE, * Bronze Weights ● Lead Weights ■ Stone Weights.

3The inventor of the balance: *Turms* or*Talnithe*?

According to Greek tradition, Palamedes, one of the heroes who participated on the Greek side in the Trojan War, was celebrated for his intelligence and genius. Many inventions are attributed to him, both for play (e.g. dice and *pezzo/latrunculi*), and for culture generally (e.g. writing).¹⁴⁵⁴ The figure of this unlucky hero won great success in Etruria, given that he is often depicted on seals and mirror backs, often in scenes of oracular prophecy.¹⁴⁵⁵ In particular, the gorgeous vase attributed to the Montediano Painter (I A.I.) shows him holding a two-pan balance, a *libra*. Palamedes holds it with his left hand, by a hook located at the center of the horizontal arm; the two pans are just about in equilibrium. The inscription that runs along the fold of the cloak (*Talnithe*, the more frequent form of *Palmithe*, which in turn is the normal Etruscan reflex of the Greek *Palamedes*) leaves no doubt as to the identity of the figure.

Near him is a nude man, with a broad hat abandoned on his shoulders. He stands on his right leg, with his left leg bent and his foot on a rock, holding the herald's staff, the *kerykeion*, in his right hand, while his left hand is at his brow. This is unequivocally *Turms* (Greek *Hermes*, Latin *Mercurius*), intent on observing the activity carried out by the youth before him. The association of the two figures is highly significant. As has been emphasized, the Greek tradition associates both of them with the invention and use of the balance.

In fact, quite early on—at least from the late sixth century, as shown by the depictions on Attic black-figure ceramics—*Hermes* had taken over the role played in Homer by Zeus of weighing the *kēres* of Achilles and Memnon before the fatal duel.¹⁴⁵⁶ His association with that instrument is due to his identification with the Egyptian god Thoth.¹⁴⁵⁷

Another tradition, which probably originated in the late fifth century, attributes the invention to Palamedes instead. As Martin Spannagel has observed, this tradition flourished in the bosom of the Sophists (the most extensive enumeration of the *euremata* [inventions] of Palamedes is in fact in Gorgias), who were particularly interested in promoting the role of progress in *technai* in human society. But we certainly cannot disregard the fact that at the same time, Euripides attributed the invention of weights (which is tantamount to saying the balance) to a goddess: Isotes, i.e. Equality.¹⁴⁵⁸

The Etruscan painter, if not entirely dependent on a Greek model, appears to have tried to compare these different traditions and seems, if the pose of *Turms* is one of amazement and admiration,¹⁴⁵⁹ to favor the tradition that extols the role of the hero.

The scene on the vase is, in fact, normally interpreted as Palamedes displaying his new invention, the balance, whose use *Turms* is then learning from him. Frankly, this seems very peculiar. Much more appropriate as the *protos euretēs* of an instrument so fundamental to commercial activity would seem to be a god who, in Greece, Rome, and certainly also in Etruria, presided over the sphere of exchange and commerce and to whom one tradition—albeit a rather isolated one—explicitly attributes the invention of weights and

measures (Diod. Sic. 5.75.2). It therefore cannot be excluded that the scene can be read differently than it usually has been. It could actually be interpreted as the moment when the *libra* was bestowed on Palamedes by the god. Comparison with the depiction on a well-known mirror from Tuscania¹⁴⁶⁰ could support this idea. Rather than a competition between haruspices, as has been supposed, I would prefer to recognize the climactic moment of the *paideia* of a youth, *Pava Tarchies*, who under the careful watch of *Avle Tarchunus* and *Ucernei*, enters a sacred space (*rathlth*) indicated by the presence of a *Veltune* and a god with the characteristics of Apollo (*Rath?*). On the krater, *Turms* does not really seem to be drawn with an attitude of astonishment. Resting solidly on his herald's staff, with his left foot on a rock, his hat hanging behind his shoulders, and his hand held to his forehead in a gesture that expresses a "suspension of time,"¹⁴⁶¹ the god examines his mortal imitator (his disciple?) in the act of receiving the new instrument.

If there remains some doubt about the actual pedigree of the invention of the balance (*Turms* the divine inventor and *Palamedes* / *Talnithe* the human *euretēs?*), certainly the god is most frequently associated in the depictions with the weighing instrument and is certainly the patron of the instrument, in his role as protector of commercial activity. It is indeed *Turms* who, on a well-known mirror with a scene of *psychostasia* (weighing of souls; I.2), raises the *libra*, with the *kēres* of Achilles and Ajax, to compare their destiny. And it is *Mercurius* who on a Praenestine *cista* displays the balance as one of his attributes.¹⁴⁶²

An extraordinary object was recently discovered that demonstrates that this was his specific sphere of action in Etruria, as in Praeneste and Rome. This is not a *libra*, but a steelyard, a more developed instrument that exploits the principle of the lever. It was discovered beneath the sanctuary during excavations in the southeastern sector of the Caere plateau, an extensive sacred area that contains two temples, one of them certainly dedicated to *Hercle*.¹⁴⁶³

Actually, only the counterpoise of the steelyard is preserved, the oval *aequipondium* (II.3). This discovery is exceptional because a long inscription covers the object's surface, unfortunately not easily read because of deep abrasions. Before dealing with the content of the text, it is appropriate to recall that this is not a unique type of object recovered from Etruria. In fact, not many years ago, two similar pieces were found at Chianciano in a cluster of objects that are unquestionably the furnishings of a sanctuary. These are two weights (II.1–2) with two-faced depictions, which stylistically can again be placed in the fourth century.¹⁴⁶⁴

From an iconographic point of view, the two pieces from Chianciano do not seem to make a positive contribution to the question dealt with here. As it happens, while the double female face (II.1) is too vague to lead to any specific identification, the other (II.2) is perfectly familiar, with the contrasting faces of Satyr and Maenad. The presence of these beings, and

through them the intrusion of the Dionysiac world into this particular technical space did not find immediate reflection in the sphere of competence of the god *Fufluns*.

Since all evidence points to material coming from a sanctuary in which the Dionysiac component must have been important (cf. e.g. the large krater depicted on the preserved portion of the clay pediment),¹⁴⁶⁵ we might think that here too—as in Rome—it was a matter of official weights, placed under the protection of the titular god of the sanctuary, a god who, although he did not have direct jurisdiction over commerce, was nonetheless very close to the classes that engaged in trade.

4The inscribed *pondera*

Incised on the conical weight I.3 is the following dedicatory text: *ecn: turce: laris: thefries: espial: atial: cathas*.

Despite the linguistic difficulties it presents, there is no doubt that it is an epigraph of dedication to *Catha*, a goddess in many ways close to *Fufluns* (*Dionysos* in Greek, Latin *Liber* in Rome).

The text inscribed on the weight from Caere (II.3) occupies ten lines. We quote the transcription by the first editor, Mauro Cristofani, with a suggested new reading of the second, sixth and the last line: *Raths turmsal / vel uchs luvchmsal / thusti thui methlmth / mu [- -] s x mse / macuni Hercles / alpan tece II C / e VII CC / lc.penthe.vel/ lape zilci lath / ale nulathesi*.

The first line has the names of the gods *Turms* and *Rath*. There follow a personal name—presumably the dedicator (Vel Uchs)—and a mention of the divine name *Hercle*, perhaps the patron of a sacred space in which the offerings were dedicated. The following part is very obscure. We can recognize some signs, perhaps to be identified as numerals (IIC= 2,5?). It closes with a formula to be read *zilci lathale nulathesi*, “in the magistrature (*zilc*) of Larth Nulathe.”

The conclusions to be drawn from so complicated a text, which certainly deserves a careful reexamination (which at this point is not possible to carry out), cannot be but extremely provisional and problematic.

One certain element, however, is that the inscription identifies the weight as the sacred property of *Turms*. This must eliminate any doubt about the true jurisdiction, even in Etruria, of the god over this chief instrument of commercial transactions by the late fourth century.

If Cristofani’s interpretation of the central part of the inscription has hit the nail on the head, it records a dedication by two people, *L(ar)c(e) Penthe* and *Vel Lape*, in the urban sanctuary of *Hercle*. We may then ask whether these two names instead have something to do with the signs, probably numerals, in line 7. If these numbers are an indication of weight, it is difficult to escape the

suggestion, to make a comparison with the Roman model. At Rome steelyards and *pondera* often carry inscriptions recording that the instruments were, at a time specified by the consular date, under the authority of the *aediles* (and later of the *praefectus urbi*), subjected to verification with the certified standard of the state authority. Standard weights were deposited in specific places, especially sanctuaries, such as the temples of Jupiter Capitoline or the Dioscuri.¹⁴⁶⁶

In fact, the mention of the sanctuary of *Hercle*, the presence of several persons, the indication of the weight, and the conclusion that the transaction took place “in the zilcship of *La(r)th Nulathe*” all constitute elements that bear a very strong resemblance to the Latin inscriptions of this type.

29Textiles and Dress

Abstract: An understanding of the development of textile production in Etruria is crucial to any attempt to set textile technology in its social and economic context and to place textile production among other crafts, such as metal and pottery manufacture, in order to ensure a more balanced assessment of the Etruscan economy. Among the various sources of evidence available for the study of Etruscan textiles is archaeological material, consisting of textiles and tools, as well as iconographic sources. The extant textiles illustrate that the Etruscans were familiar with complex spinning, weaving, and dyeing techniques. The great quantity of surviving implements associated with textile manufacture, such as spindle whorls, loom weights, and spools, can be used to study the organization of textile production in Etruria. Iconographic sources provide important documentation of textile production processes and information about the appearance and function of Etruscan textiles. The accuracy of the latter is confirmed by the surviving textiles, in particular the almost complete garments recovered at Verucchio.

Keywords: textile, dress, textile tools, Verucchio

Introduction

Throughout antiquity, textile manufacture was practiced on all levels of society and was one of the most labor-intensive of all occupations.¹⁴⁶⁷ As such, it was an industry of great cultural and social importance, which should be factored into any balanced assessment of the ancient economy. Textiles were used for a variety of purposes in Etruscan society and textile production was an integral part of local and regional economies and local, regional and long-distance exchange. The social significance of textile production was expressed in Etruscan funerary ritual through the inclusion of textile implements among the burial goods, as well as in religious activities through the deposition of textile tools in votive deposits. Among the various sources that provide evidence for the study of textile production in Etruria, archaeological material is the most direct as it documents the productive activities through tools, installations, raw materials and finished products. With the help of other, secondary sources of information, namely the iconographic material and later written sources, it is then possible to reconstruct the sequence of production processes involved in textile manufacture.

1Precious fragments: Textile preservation

The belief that textiles hardly ever survive in archaeological contexts of Italy has tended to discourage discussions of textile production in broader studies of production and exchange in Etruria. Textiles, however, survive much more frequently than is commonly believed.

Like any organic material, textile preservation requires special conditions to prohibit their destruction by microorganisms, but many of them can be found on the Apennine peninsula. One of the largest surviving groups consists of linen textile fragments found in various Neolithic and Bronze Age sites in the north of the peninsula, where they have been preserved by the alkaline conditions of the Alpine lakes.¹⁴⁶⁸ Textile fragments made of wool, on the other hand, have been recovered from Iron Age burials, where they were conserved in waterlogged and/or acidic environments. A few Iron Age articles of clothing were recovered from the Alpine glaciers, preserved practically unaltered in the permafrost.¹⁴⁶⁹ Carbonized or charred textiles survive as a result of exposure to fire, as at Pompeii.¹⁴⁷⁰ The vast majority of textiles in Italy, however, have been preserved in association with metal objects as mineralized formations in which metal corrosion products form positive or negative casts fibers retaining their external morphology and size almost unchanged. Even when consisting of minute traces, these traces can provide a considerable amount of information about ancient textiles.

Etruscan textiles are, in fact, preserved mostly as such mineralized traces (Fig. 29.1).¹⁴⁷¹ Occasionally, textile fragments surviving in their organic form have been found, for example in an eighth century BCE cenotaph at Sasso di Furbara near Cerveteri¹⁴⁷² and in the Orientalizing tombs of Casale Marittimo.¹⁴⁷³ Exceptional finds have been made at the site of Verucchio, where the only nearly complete Villanovan garments have been excavated.¹⁴⁷⁴

2Textile function

2.1Garments

The Etruscans used textiles for a variety of purposes. Clothing is the most obvious and, without doubt, primary textile function and numerous iconographic sources, such as the tomb paintings of Tarquinia, illustrate the variety and splendor of Etruscan garments. In her seminal *Etruscan Dress*, Larissa Bonfante has extensively studied Etruscan clothing depicted on figurines, statues, vases and tomb paintings.¹⁴⁷⁵ Typical male dress, at least through the sixth century BCE, was the loincloth, observed for example on the bronze figurines from Brolio (Fig. 71.7a),¹⁴⁷⁶ and reflecting the Italic “modesty.”¹⁴⁷⁷ Both sexes were represented wearing rectangular and semicircular mantles (*tebennae*) and tunics of various lengths, pointed hats and pointed shoes. The fashions changed over time and reflected internal developments of dress as well as external influences. During the sixth century, Greek and Oriental fashions influenced Etruscan dress to some extent. This is evident in the adoption of short chiton for men, well illustrated in the painted terra cotta plaques from Cerveteri,¹⁴⁷⁸ and in the use of elaborate lotus palmette decoration painted on stone statue from Polledrara, Vulci.¹⁴⁷⁹ By the fourth century BCE, Etruscan garments have clear connection—in form or meaning—with Roman costumes. Thus, the figured mantle worn by Vel Saties in the Tomba François at Vulci—not a *toga picta* but a *himation*—has the same meaning as the Roman triumphal garment.¹⁴⁸⁰ The first century BCE statue of Aulus Metellus is clad in a tunic with vertical stripes or *clavi*, which signified a high social standing in Roman society.¹⁴⁸¹

Of the surviving Etruscan textiles, most are garments as well. The spectacular finds of Verucchio provided for the first time direct archaeological evidence for what some of the Etruscan garments looked like. One of the richest is Tomb 89, the so-called *Tomba del Trono*, a chieftain’s burial from around 700 BCE.¹⁴⁸² In addition to numerous small fragments surviving on the funerary pyre, it contained two semicircular mantles, a garment with two curved edges and a small nearly square textile with stitched hems on all four sides.¹⁴⁸³ The large semicircular mantles decorated with a decorative tablet-woven border running all around the edges and originally measuring

approximately 270 by ninety centimeters were dyed and preserved traces of further decoration with amber buttons and other appliqués in the form of stitching holes (Fig. 29.2). The mantles from Tomb 89 are the earliest *tebennae* known and, as such, are the predecessors of the Roman toga. Unlike the latter, the Verucchio mantle would have covered only parts of the wearer’s back while the long ends could be wound around the arms as depicted in iconographic sources. A later and longer version of the *tebenna* can be observed on the first century BCE statue of Aulus Metellus.¹⁴⁸⁴ Another

garment found in Tomb 89 had four semicircular edges, decorated with tablet-woven borders. Two of the opposing curved sides may have served as sleeves. Garments of this type are possibly depicted on the later wall paintings in Tarquinia. The Romans acknowledged the Etruscan origin of their *tunica*.¹⁴⁸⁵

Fig. 29.2: Mantles from Tomb 89, Verucchio, late 8th century: (a) mantle 1; (b) mantle 2 (© Cologne University of Applied Sciences)

Tomb B/1971 at Verucchio, dated around the same time as Tomb 89, provided evidence of another type of male garment, a large rectangular garment with straight side edges and rounded lower edges (Fig. 29.3).¹⁴⁸⁶ A similar garment of this type was found in the same tomb or Tomb 85. A remarkable feature in both of these garments is the presence of regular pleats in two directions. Elaborate pleating is a common feature of garments depicted in Etruscan iconography, e.g. on the Apollo of Veii, which until now has been regarded as a decorative element or artistic convention.

Another distinctive Etruscan textile and dress element illustrated by the iconographic sources and encountered in the Verucchio finds is the decorative border present on both male and female mantles and other garments. Both Verucchio mantles have elaborate borders featuring a triangle motif and three horizontal lines made by the tablet-weaving technique.¹⁴⁸⁷ Even more elaborate are the tablet weaves found in the eighth century BCE cenotaph at Sasso di Furbara.¹⁴⁸⁸ Tablet weaving involves passing threads through holes in the corners of (usually) square tablets, which, when rotated forward or back, force the threads to form different sheds. By rotating cards in different combinations, it is possible to achieve numerous patterns. This method is suitable for weaving narrow bands, such as belts, heading bands for the warp of a warp-weighted loom, or decorative borders for the base textile. Such tablet-woven borders are technically complex, extremely labor-intensive, and time consuming. Such textiles must have served as indicators of social rank or as “ceremonial” clothes, with the border being the distinguishing element characterized by technique, pattern and color.¹⁴⁸⁹ In fact, the toga, the Roman descendant of the Verucchio mantles, retained the border as the status symbol, in this case dyed purple.

Fig. 29.3: Garment from Tomb B/1971, Verucchio, late 8th century (dimensions in centimeters) (© Cologne University of Applied Sciences)

It is all the more significant that purple was likely the color of the borders of the Verucchio mantles as well. Dye analyses of the textiles of Verucchio provided for the first time direct evidence for the colors of Etruscan textiles.¹⁴⁹⁰ Thus, Verucchio Mantle 1 was dyed red with madder, while the fibers of its border were most likely treated with madder and woad resulting in a purple hue. Mantle 2, on the other hand, was dyed red-orange with madder and a yellow dye, while its border was also dyed with woad, creating a purple-red effect. The garment from Tomb B/1971 was dyed blue with woad. Dye analyses thus demonstrate that several different dyes were used to add color to the Verucchio textiles, while their combination in some textiles shows an understanding of a complex, multiple-stage dyeing process.

A glimpse of the female garments is provided by the yet to be analyzed textiles discovered in Tomb 26/1969 at Verucchio, which are woven in diamond twill binding and have a checkered pattern.¹⁴⁹¹ Such checkered textile designs are frequently depicted on Etruscan monuments¹⁴⁹² but only with the discovery of the actual textiles their complexity and sophistication is becoming apparent.

The textiles discovered at Verucchio thus demonstrate not only that the garments we know from iconography reflect the reality of Etruscan dress in terms of shape, color and decoration but also that these garments date to a considerably earlier period.

While less spectacular, mineralized textile traces on metal articles of personal decoration such as bracelets, belts, and, most commonly, fibulae also provide information about Etruscan clothing. Thus, when traces of different weave type are found on the same fibula, as for example in some of the finds from Tarquinia Le Rose (Fig. 29.4),¹⁴⁹³ a conjecture may be made that the deceased was wearing several layers of garments. If a number of textile traces are present in a burial, it may be possible to reconstruct how the garment was located based on their distribution and position. Even if textiles do not survive, their presence may be indicated through other evidence, such as the presence of fibulae and other decorative ornaments. In some instances, reconstructions of garments are possible based on the position of surviving decorative elements in relation to the skeleton, sarcophagus, or trench, as in the case of some female costumes for the burials at Verucchio.¹⁴⁹⁴

Fig. 29.4: Textile traces on a fibula from Tomb XLIV, Tarquinia Le Rose, early 7th century; the drawings show two sides of the same fibula, preserving different textiles

Ongoing analysis of numerous mineralized textile fragments preserved in rich burials demonstrates that Etruscans were familiar with complex textile technologies, which allowed creation of fabrics that would have had a specific appearance. Just like the Verucchio garments, the vast majority of these textiles are made of wool and woven in twill weave. In a twill, the horizontal weft threads pass over and under vertical warps in a regular staggered pattern, each row being stepped to one side of the row above, creating a diagonal effect. The variants include a plain diagonal, warp- or weft-chevron, broken and more complex diamond and dogtooth twills. These twills are often spin or shadow-patterned, i.e. made using alternating groups of threads spun in opposite directions, which would have created a subtle pattern of checks or stripes, visible only up close and in a raking light. The quality of these textiles is also rather homogeneous. Threads have diameters of less than half a millimeter and thread counts per centimeter are usually twenty to thirty. The textiles are usually balanced, i.e. have a similar number of threads in warp and weft. Last but not least, these twill textiles often have tablet-woven borders.

These technical characteristics find almost exact parallels in Central Europe, where Hallstatt elite consumed very similar textiles: there is an almost infinite variety of dyed and patterned twills, many of the twills are spin patterned, and many complex tablet weaves have been found.¹⁴⁹⁵ In contrast, the contemporaneous extant textiles found in Greece are tabbies or weft-faced tabbies,¹⁴⁹⁶ tabby being the simplest textile structure attainable with two systems on a loom, with vertical warp and horizontal weft threads alternating one over one in each direction—a textile culture more closely related to the Near East.

Occasionally, textile remains are found on the inside of armor, suggesting that they may have belonged to lining or a garment worn under the metal, as in the case of the Tomba del Guerriero at Tarquinia dated to the end of the eighth century BCE.¹⁴⁹⁷ Furthermore, iconographic evidence suggests that textile fibers were used for particular kind of linen amour, depicted in the Amazon Sarcophagus, Tomba François and Tomba dell'Orco II.¹⁴⁹⁸

In some cases, the dead were provided with very sumptuous dresses. The garments found in the burials of Verucchio, as well as the Polledrara Tomb at Vulci were decorated with thousands of amber, glass or *faïence* beads and appliqués.¹⁴⁹⁹ Whether such garments would have been worn before their deposition in burials is a debatable issue. Still, the majority of clothing articles found in graves could have been, and most likely were, used in life. Confirmation comes again from the Verucchio garments, which have wear marks and, hence, must have been used by the deceased in life.¹⁵⁰⁰

2.2 Wrappings

The vast majority of extant Etruscan textiles come from burial contexts, thus demonstrating that they constituted a very important part of broader mortuary practices. Thus, one use of textiles in burial ritual was to wrap the cremated remains of the buried individual. Many scholars connect this practice to a ritual described by Homer for the burials of Hector and Patroklos (*Il.* 24.796 and 23.254), which is believed to have been adopted by the elites throughout the Mediterranean during the Iron Age.¹⁵⁰¹ This “Homeric” ritual then spread quickly among the Etruscan elites, as attested for example by the finds at Casale Marittimo, where a bronze cinerary urn found in Tomb A contained textile remains that probably served as wrapping for cremated bones.¹⁵⁰² In Tomba del Duce at Vetulonia, a cloth was found inside a bronze and silver box (*larnax*), which contained cremated bones.¹⁵⁰³ The custom survived into later times as well. Travertine urns in the second–first century BCE Strozziacapponi cemetery of Perugia contained mineralized textile remains in which cremated remains were wrapped.¹⁵⁰⁴

Italy, however, had a well-developed “wrapping” tradition of its own, as attested by the grave finds dated as early as the ninth century BCE.¹⁵⁰⁵ The cinerary urns at Bologna and in particular the ossuaries in the burials of Verucchio were wrapped in textiles that were then fastened with fibulae and decorated with other accessories, as if wearing a garment.¹⁵⁰⁶ These textiles have been interpreted as clothing for the urns, and thus as representing the deceased.¹⁵⁰⁷ It has also been suggested that biconical urns—containers of cremated remains typical for the Villanovan period and frequently covered with bronze or ceramic helmets—represent the deceased, and that their incised geometric patterns, which are similar to woven motifs, are intended to represent a garment.¹⁵⁰⁸ “Canopic” urns typical for the region of Chiusi may strongly support this theory. The tradition was probably much more widespread. While textiles do not usually survive, the position of various small decorative objects, such as fibulae, around the urn, may indicate presence of a cloth, which was fastened with them, as is the case of several cinerary urns at Tarquinia.¹⁵⁰⁹

Occasionally, finds indicate a combination of wrapping the cremated remains with “dressing” of the ossuary. Thus, in the Orientalizing “princely” Morelli tumulus at Chianciano Terme, an anthropomorphic cinerary urn found in the southern cella of the tomb was wrapped with a textile that was fixed around the neck of the urn with a fibula.¹⁵¹⁰ The iron fibula preserved the mineralized traces of the textile. Inside the ossuary, traces of another fabric were identified, which likely contained the cremated remains.

Textile traces indicate that, apart from cinerary containers, certain metal objects came into close contact with textiles because they were intentionally wrapped or enclosed in fabric.¹⁵¹¹ Knives, weapons, stryils, spits, and mirrors are among the most common objects to bear textile traces. In some cases, the traces are clear enough to reconstruct the direction of a cloth band wrapping a particular object. The deposition of thus “enclothed” objects in

urns excludes the possibility of accidental contact with textiles. It is unclear whether this phenomenon has a ritual significance in funerary context or represents a regular practice of safekeeping of precious metal objects. However, the finds indicate that wrapping was common not only throughout Italy, but also in Hallstatt societies (modern-day France, southern Germany and Austria), suggesting that it had a wider, pan-European significance.

2.3 Furnishings, utilitarian fabrics, ship sails and books

Besides garments, there are frequent representations in Etruscan tomb paintings of colorful bed covers, cushions, tablecloths and other utilitarian textiles.¹⁵¹² Although to date no direct evidence for wall hangings in Etruria comes in the form of textile remains, a clear indication of their existence is given by the ceiling and wall paintings in the tombs of Tarquinia. Checkers and small flowers on the ceilings are unquestionably textile patterns, the entire tombs representing tents or pavilions with roofs made of cloth, best exemplified in the Tomb of the Hunter.¹⁵¹³

A unique ancient use of textiles in Etruria was for books. Called *libri lintei* by the Romans, they were made of linen and used for recording religious rituals. Fragments of one such book, the so-called Zagreb mummy wrappings were preserved in Egypt.¹⁵¹⁴ Evidence for their use also exists in Etruscan art and Latin literature. Production of textiles for these ritual objects must have been strictly controlled and adhered to specific regulations.

Another important use of textile fibers—especially flax and hemp—was for sails and ship rigging. Etruscans were notorious throughout the Mediterranean as sailors and—according to their enemies—as pirates. Their ship building technology was among the most sophisticated for their era, including the use of the earliest foresail.¹⁵¹⁵ No Etruscan sail fragment has survived but it should be kept in mind that manufacture of large textile quantities, as in the case of sail production or army supplies, required considerable resources, organization and planning.

3 Textile production

In order to create a textile, raw material has to be transformed in a series of processes that include raw material acquisition and preparation, spinning, weaving, dyeing and finishing. Each stage of this transformation leaves its mark on the final product, which can be recovered through textile analysis. Resources for making textiles include plant and animal products used for fibers and dyes, as well as those used in various stages of textile making, such

as washing or fulling. In this way, agriculture, animal husbandry, exploitation of environmental resources, and landscape use are closely linked to textile production.

Fig. 29.5: Scenes from the Throne of Verucchio depicting women spinning and weaving, Tomb 89, Verucchio, late 8th century (after von Eles 2002, fig. 127)

Procurement of raw materials is the first step of any production process. Two fiber groups, divided on the basis of their origin into plant and animal, were used for making textiles in Etruria. The principal plant fiber was flax. The major animal fiber was sheep wool. Wool was sorted according to color and fiber quality. Flax required much more complex processing to extract fibers from plants, which involved retting in dew or water.

Once the fiber mass has been obtained and prepared, it can be converted into a yarn and woven into a fabric. Several Etruscan iconographic documents illustrate these stages of textile manufacture, underlining the economic and social importance of the craft for the Etruscan society. An important scene related to textile production appears on the wooden cylindrical throne found in Tomb 89 at Verucchio (Fig. 29.5). While interpretations of the intricately carved scenes vary,¹⁵¹⁶ most scholars agree that spinning and weaving are among the activities depicted.

Another important object comes from the area of Bologna and is one of the most important and detailed representations of textile production in the ancient world, a bronze rattle or *tintinnabulum* found in Tomb 5 of Bologna's Arsenale Militare necropolis, dated to the late seventh century BCE (Fig. 29.6).¹⁵¹⁷ It is a flat, bell-shaped object, made of two bronze sheets connected at the edges and decorated in a *repoussé* technique. Each side of the *tintinnabulum* is divided into two sections, allowing space for four scenes depicting various stages of textile manufacture. The bottom scene of side A depicts two women seated in throne-like chairs, reminiscent of the Verucchio throne. In their left hands, each woman holds a distaff, and with their right hand, each pulls a strand of fiber from the basket in the center; they are

dressing the distaffs for spinning. The top scene of side A shows a woman performing the task of spinning. She is standing in profile, holding a dressed distaff in her extended left hand, while a drop-spindle hangs from her right hand. Side B of the *tintinnabulum* shows activities associated with weaving. The bottom scene represents the weaving of the starting border necessary for the warp-weighted loom, while the last scene provides a rendering of an unusual two-storied warp-weighted loom.

Fig. 29.6: *Tintinnabulum* from Bologna, Arsenale Militare, Tomba degli Ori, bronze, late 7th century: (a) side A, with scenes of dressing the distaffs (*bottom*) and spinning (*top*); (b) side B, with scenes of warping (*bottom*) and weaving (*top*) (© Bologna Museo Civico Archeologico)

Both of these iconographic documents illustrate that textile production processes are associated with particular tools. Unlike the textiles themselves, textile implements are ubiquitous on Etruscan archaeological sites. The great number of implements associated with textile manufacture can be used to study the craft and its technological and economic aspects. Spinning and weaving implements constitute the single most important and plentiful type of evidence for the assessment of the scale of production and the technology of this industry in Etruria. Furthermore, many textile tools have been found in burial and votive contexts, providing another interpretative framework.¹⁵¹⁸

Fig. 29.7: Ceramic spindle whorls, Poggio Civitate di Murlo, 7th –6th century (courtesy of Anthony Tuck)

Spinning activity is well attested archaeologically in both burial and settlement contexts in Etruria.¹⁵¹⁹ A long spindle, with its whorl still on the elaborately decorated wooden shaft, was recovered from the underwater village of Gran Carro in Lake Bolsena, dated to the early ninth century BCE.¹⁵²⁰ In addition to the rare surviving wooden and bone items, there are examples made of metal, all of which were found in burial contexts. One example is a set of a bronze spindle with a bronze biconical whorl and a bronze distaff from the eighth-century BCE Benacci-Caprara Tomb 56 in Bologna.¹⁵²¹

Since most spindles in antiquity were made of wood, often the only evidence for their use consists of the less perishable spindle whorls. The vast majority of spindle whorls in Italy are made of fired clay (Fig. 29.7), but whorls made of luxury materials like glass and amber have also been found in Etruscan burial contexts. Spindle whorls, have often been found in large numbers at practically every Etruscan settlement site. The majority of sites yield a variety of whorl shapes, although a specific type often predominates, suggesting either that it was traditional at the site, or that the site specialized in a certain quality of yarn and, consequently, a certain type of textile.

Weaving in Etruria was accomplished on a vertical warp-weighted loom. Occasionally, charred remains of the wooden beams are preserved in association with loom weights, which allows speculation about their probable position. For example, at the fourth-third century BCE building at La Piana, some of the charred wood timbers, found together with an accumulation of loom weights near the north wall in one of the rooms of the house, probably were remains of a loom frame.¹⁵²²

The most common evidence of the warp-weighted loom, however, consists of loom weights, which were made of fired clay and therefore survive well in the archaeological contexts, allowing us to trace the presence and sometimes even location of a warp-weighted loom on sites (Fig. 29.8).¹⁵²³ The trapezoidal or truncated pyramidal shape seems to have been prevalent in

Etruria, although ring-shaped loom weights were common in northern areas. Occasionally loom weights are found *in situ*, having fallen to the ground when the warp to which they were originally attached was destroyed or deliberately cut, as for example at Acquarossa.¹⁵²⁴ Such finds provide important information about the location and size of the loom.

Fig. 29.8: Terracotta loom weights, Poggio Civitate di Murlo, 7th –6th century (courtesy of Anthony Tuck)

Tablet weaving in Etruria is attested by tablets, metal clasps, bone spacers with pegs, and particularly by terracotta spools (Fig. 29.9).¹⁵²⁵ The latter were probably used as weights in tablet weaving.¹⁵²⁶ Finally, the evidence of sewing activities consists of numerous finds of bronze and bone needles.

4Conclusion

Surviving evidence illustrates the abundance and variety of textiles and their uses in Etruria. Garments, furnishings, utilitarian fabrics, sails, and even books were made of textiles. Different functions required different properties, which in turn demanded different choices and careful planning at various stages of textile production. A sophisticated technology with the capacity to produce highly complex and labor-intensive textiles developed in Italy by the Villanovan period and reached its peak during the Orientalizing and Archaic periods. The abundance of textile tools on settlements and in burials from the Villanovan period onwards demonstrates that textile production was one of the main economic activities and sources of wealth for the Etruscans. During the Orientalizing and Archaic periods, there was a significant increase in the scale of textile production, indicated by the large number and standardization of tools. Frequently, textile implements are concentrated in specific areas where the production of other goods, like ceramic or metal, has been

documented, suggesting a household or even workshop mode of manufacture and the existence of at least part-time specialist craftspeople. Cloth was likely produced for commercial purposes and textile trade in Etruria has been tied to salt, amber, slaves and other commodities.¹⁵²⁷ Textile trade seems to be indicated indirectly by the spread of Etruscan fashion to central Europe as attested in the Situla Art.¹⁵²⁸ While there is no evidence that textile production in Etruria ever reached an industrial scale of organization before the Roman period, there is strong indication of a manufacture mode, which greatly exceeded in quantity the simple subsistence-based household production.

30Musical instruments

Abstract: The great importance of music in Etruscan civilization is attested by several ancient Greek and Latin authors, who place a strong emphasis on the aerophones such as *auloi*, conches, horns, and trumpets of various kinds—namely the Latin *cornu*, *lituus*, and *tuba*. This assertion has been confirmed in recent times by various scholars, who also take into account the large number of musical instruments and the wide range of iconographic evidence that have been found at Etruscan sites, which span from the beginning of the seventh century to the first century BCE. While the only specimens that survive are, of course, those made of nonperishable materials like metal or clay, the iconographic evidence—such as the tomb paintings and other kinds of representations—clearly show that almost all of the musical instruments that were widespread in the Mediterranean at the time were also used in Etruria on many different occasions, including public and private ceremonies, rituals, and daily life. Tantalizing glimpses of the earlier presence of perishable instruments—such as wooden pipes and string instruments—are provided by the surviving parts made of ivory or bone, including a few pipes, joints between pipe and reed, and plectra. One notable feature in the Etruscan context seems to be the complete lack of membranophones—in particular the frame drum—which had still not appeared by the turn of the fifth century, and by which time all of the other musical instruments were already firmly established in the area.

Keywords: Aerophones, Chordophones, Idiophones, Membranophones

Introduction

This chapter presents the four main groups into which the original Sachs-Hornbostel system classified musical instruments,¹⁵²⁹ here presented as three of their families in decreasing order of the relevance of the Etruscan evidence.¹⁵³⁰

1Wind instruments (aerophones)

1.1Pipes

Several ancient Greek and Latin literary sources point out the close relationship between the Etruscans and the world of sound tools, particularly instruments belonging to the “aerophone” family of wind instruments. The most common of these is the double-tube reed aerophone (Fig. 30.1.1), known

in Greek as the *aulos* and in Latin as the (plural) *tibiae*. With regard to its Etruscan name, it can be observed that the Latins applied the term *subulo* to the Etruscan player of this instrument, indicating that the Etruscan word *suplu* refers to the player of this instrument, if not to the instrument itself.¹⁵³¹

Aristotle (fr. 608 Rose)¹⁵³² was surprised to find the Etruscans boxing, lashing their servants, or, according to a further detail provided by Alcimus of Sicily (Ath. 12.518c = *FGrH* 2.560 F 3), kneading their bread while listening to the sound of the *aulos*; while Aelian (*NA* 12.46) maintained that the Etruscans even used the double pipe¹⁵³³ when hunting wild boar and deer. Athenaeus (13.607f) remarks on the custom of sneering at Polystratus the Athenian, a pupil of Theophrastus who often used to put on the garments of female double pipe players, by calling him “the Etruscan”; and according to Ovid (*Ars Am.* 1.111), the first Etruscan who took part in the events of Rome was a musician playing the *tibiae* during the “Rape of the Sabine Women.”¹⁵³⁴ The Romans usually employed Etruscan double pipe players for their ceremonies, of which the music was a vital component. As Livy (9.30) certifies, the *tibicines* were considered essential by the Romans during their rites. The prestige of the Etruscan players is confirmed by Ennius (*Saturae* 65), who when referring to this type of musician did not use the Latin term *tibicen*, but the Etruscan *subulo*; and by Virgil (*G.* 2.193–94), who made a pointed reference to an Etruscan player who was intent on blowing his ivory instrument at the altar, in front of trays of steaming entrails (*inflavit cum pinguis ebur Tyrrhenus ad aras, lancibus et pandis fumantia reddimus exta*).

As for the materials from which the *tibiae* were made, Pliny the Elder provides some specific information (*HN* 16.172): the Etruscan double pipes played on ritual occasions were made of boxwood, while the instruments played for entertaining were made of lotus wood, donkey bone, or silver. Due to the perishable nature of the wood, only rare

examples have survived. Eleven fragments of pipes—ten of boxwood and one of ivory—were recovered from the ship wrecked around 600 BCE at the Bay of Campese, in the Isola del Giglio,¹⁵³⁵ and a further fragment of pipe, with four holes and made of bone, has been found in the area of Chianciano.¹⁵³⁶ A few joints between pipe and reed are also known.¹⁵³⁷

Fig. 30.1: Aerophones (nos. 1–5): No. 1 Tomb of the Leopards, Tarquinia. No. 2 Conch-trumpet from Tomb 1 at Poggio dell'Impiccato, Tarquinia. No. 3 *Lituus* from the Pian di Civita, Tarquinia. No. 4 (a) *Cornu* from the Tumulo dei Carri, Populonia; (b) *cornu*, from Tarquinia or Tuscania, in the British Museum. No. 5 *Corno Castellani*, Tarquinia

The large volume of iconography related to music produced by the Etruscans provides further information as well as confirmation as to how instruments were used. For one example, musicians and dancers are represented in tomb paintings with surprising frequency. About 180 of the painted tombs contain representations of figured subjects, almost 80% of them in Tarquinia; depictions of at least 129 musical instruments survive from fifty-two tombs, dating from 520 to the end of the third century.¹⁵³⁸ The double pipe is by far the most frequently represented instrument, with sixty-seven examples. Another survey, of a large number of archaic funerary urns from Chiusi decorated with incised relief, produced parallel results, identifying forty-two instruments on thirty-eight urns, spanning from the first half of the sixth century to the middle of the fifth.¹⁵³⁹ On urns too, the double pipe is the most frequently represented instrument, with twenty-two examples. The Etruscan tomb paintings confirm some of the statements from the literary sources, such as the presence of double pipe players at boxing and fighting games or, as in the painting at Golini Tomb I in Orvieto (second half of the fourth century), showing Alcimus's detail of this instrument being played during the kneading of bread.

The reed, an important part of the instrument with great influence on its sound properties and playing techniques, is unfortunately the most fragile part, so no Etruscan reeds have been found archaeologically. In addition, in almost all extant depictions, the musicians are shown playing but the reeds cannot be seen, as the mouthpieces are depicted inside the mouths of the performers. In only one painting—on the left wall of the Tomb of the Lionesses in Tarquinia (530–520 BCE)—is the instrument depicted not being played, but the depiction is too sketchy and the preservation of the painting too poor to enable definitive conclusions. Consequently, whether the reed is double or single—one of the main factors that affects the timbre of the instrument—cannot be determined. Nevertheless, since this ancient double pipe was certainly a reed instrument, as demonstrated by the iconographic evidence, which always depicts players with their cheeks distended,¹⁵⁴⁰ the current practice, however common, of referring to it as “double flute” is a mistake, incorrect from an organological point of view.

1.2 Trumpets

Another group of aerophones, very well attested in ancient literary sources, includes all sorts of trumpets, from those fashioned from a conch (Fig. 30.1.2) to those made of copper or bronze.¹⁵⁴¹ In the ancient sources, the trumpet is usually presented as an Etruscan invention. It is frequently represented in iconography and is common in the archaeological record. These long Etruscan trumpets¹⁵⁴² were designated by the Romans with three terms for their different shapes: *tuba*, *lituus* (Fig. 30.1.3), and *cornu* (Fig. 30.1.4). The *tuba* is

a straight tube that gradually expands from the mouthpiece to the end of the bell. The *lituus* is a straight tube that expands only at the end with a bell curved backward. The *cornu* is a wholly curved tube that gradually expands from the mouthpiece to the end of the bell, and is sometimes equipped with a supporting bar that allows the player to better handle the instrument when carrying and playing it, and also to increase its rigidity (Fig. 30.1.5).

These types of musical instruments were among the main symbols of rank employed in Etruscan ceremonies, and all ancient sources considered them to be an Etruscan invention.¹⁵⁴³ The *Tyrsēnike salpinx* “Etruscan trumpet” is mentioned in classical Greek tragedies by Aeschylus (*Eum.* 566–69), Sophocles (*Aj.* 17), and Euripides (*Heracl.* 830–31; *Rhes.* 989; *Phoen.* 1377–78). Much other ancient lexicographic, scholiastic, and literary evidence has confirmed this same origin, such as Pollux (4.85–86), Athenaeus (4.184a), Hesychius (λ 836 Latte), Virgil (*Aen.* 8.526) and Servius (ad loc.), Tatianus (*Ad Gr.* 2), Statius (*Theb.* 3.648, 6.404, 7.630), Theodoret of Cyrrhus (*Graec. affect. cur.* 1.19), Clement of Alexandria (*Strom.* 1.16.74.6, *Paedagogus* 2.4.42.2), Isidore of Seville (*Etym.* 3.21.3), and the scholiasts to Aristophanes (*Ran.* 133) and Lycophron (Tzetz. in *Lycophr.* 250). Moreover, while all sources plainly attribute an Etruscan origin to the trumpet by using a general term like Gk. *tyrsēnike salpinx* or Lat. *tyrrhenica tuba*, some of them also refer to the specific circumstances of its invention, or even claim to name the supposed inventor of the instrument or the person responsible for its spread to other populations. Diodorus Siculus (5.40) is very clear when he writes that the trumpet is an Etruscan invention, originally conceived for military purposes. He states that the Tyrrhenians (= Etruscans) contrived this tool, which is extremely useful in war, in order to organize their army. Pausanias (2.21.3) maintains that the inventor was *Tyrsenos*; Silius Italicus (*Pun.* 5.9–13), in his brief narration of the Etruscan migration to Italy, mentions *Tyrrhenos*, the eponymous hero, who led young people from Lydia across the sea to the Latin shores, gave his name to the land, and introduced the trumpet to the people he met—as a musical instrument characteristic of war and as a symbol of the power he would establish in Italy. Hyginus (*Fab.* 274), unlike Silius Italicus, for whom *Tyrrhenos* merely introduced the trumpet to Italy, names him as the inventor of an instrument used to call distant peoples for announcements of important events. According to Hyginus, when one of his comrades died, Tyrrhenos would blow on a hollow conch (*concha pertusa*)—an ancestor of the trumpet-type instruments—to gather the inhabitants of the area and declared that they would bury—not devour—the dead.

As confirmation of the presence of this instrument in pre-Etruscan times, a shell of a gastropod (*Charonia nodifera*) with a truncated apex comes from the rich array of grave goods found in Tarquinia in the cremation burial of an eminent warrior, dated to Iron Age IC or IC/IIA.¹⁵⁴⁴ This specimen was placed near the urn, close to its extant handle, as a symbol of high rank and probable sign of military power. Isidore of Seville (*Etym.* 18.4.2) ascribes the

invention of the trumpet to the Tyrrhenian pirates (*praedones*), and he also explains the reason why they needed to do this. Being scattered around the coast (*dispersi circa maritimas oras*), they invented the *tuba* because, by virtue of its penetrating sound, it could be heard even at a long distance. The same text explains that the *tuba* was later used in battle to give orders because its sound could reach where the voice of the herald could not be heard because of the uproar of the fight. Pliny the Elder (*HN* 7.56.201) and Photius (λ 284 Theodoridis) attribute this invention to *Pisaeus* the Tyrrhenian, eponym of the city of Pisa, while according to Lactantius Placidus (ad Stat. *Theb.* 4.224, 6.382) the credit should go to *Maleus*, son of Hercules and Omphale, king of the Etruscans and leader of pirates. The Etruscan trumpets are also mentioned in ancient lists of trumpets written by other scholiasts and in the *Suda*.¹⁵⁴⁵ Aristonicus (165 van der Valk) makes a clear further distinction between the Greek instrument and the Etruscan, specifying the form of the former and reporting that it was invented by Athena; then, in addition to the shape, he also refers to the sound quality of the latter. However, in attributing the invention of the Hellenic trumpet to Athena, he nevertheless demonstrates a link of this instrument to the Etruscans by providing the detail—absent from other sources—that the Greek goddess invented the trumpet for the Tyrrhenians.

The three different types of Etruscan trumpet, although they are not a frequent subject in tomb paintings, are nonetheless represented in at least eighteen examples in Tarquinia,¹⁵⁴⁶ seven in Orvieto,¹⁵⁴⁷ and two in Chiusi;¹⁵⁴⁸ a pair of *cornua* and two *litui* are among the painted stucco reliefs decorating the Tomb of the Reliefs in Caere, dating to the last quarter of the fourth century.¹⁵⁴⁹ Further iconographic evidence can be drawn from the aforementioned repertoire of archaic funerary urns from Chiusi,¹⁵⁵⁰ from two stelae in the Museo Civico Archeologico in Bologna dating to the second half of the fifth century,¹⁵⁵¹ some late urns from Volterra,¹⁵⁵² painted vases from Etruscan workshops,¹⁵⁵³ bronze objects like the *Situla Benvenuti*¹⁵⁵⁴ (end of the seventh century) and the *Situla Arnoaldi*¹⁵⁵⁵ (fifth century), and other significant finds.¹⁵⁵⁶ The different occasions in which these instruments are shown include mainly funeral processions for prominent people and warfare, confirming the great importance attributed by the Etruscans to the various trumpets as symbols of military, political, or religious power. Even the rites associated with the foundation of an Etruscan city could include the use of a *lituus*.¹⁵⁵⁷ As noted by Cicero (*Div.* 1.30), this musical instrument and the augural rod that is characteristic of the Etruscans are referred to with the same name because of their resemblance. According to John Lydus (*Mens.* 4.73), this ritual instrument was also used by Romulus in the founding of Rome, and a bronze specimen from Tarquinia was retrieved in a votive pit, bent in two places and buried along with an axe and a shield around 675 BCE, probably during such a rite.¹⁵⁵⁸ So far, five other examples of Etruscan *litui* are more or less known, besides the one from Tarquinia: one from Vulci,¹⁵⁵⁹ another from

Cortona,¹⁵⁶⁰ a fragment in the Badisches Landesmuseum in Karlsruhe,¹⁵⁶¹ and two other instruments of unknown origin.¹⁵⁶²

An example of an Etruscan *cornu* without crossbar, dating to the first half of the seventh century, has been found in Populonia,¹⁵⁶³ and two others, which were probably found in Tarquinia or nearby, and some related fragments are in the British Museum.¹⁵⁶⁴ There is also one complete *cornu* with crossbar, the *Corno Castellani*, from Tarquinia,¹⁵⁶⁵ where six crossbar elements and a mouthpiece, likely of bronze,¹⁵⁶⁶ are in the local museum.¹⁵⁶⁷ Note that according to Strabo (5.2.2) trumpets, religious practices, and music were imported to Rome direct from Tarquinia, and Athenaeus (4.184a) also maintains that the *cornu* was invented by the Tyrrhenians.

One last relevant question concerns the mouthpiece of these instruments. While the bronze mouthpieces of all surviving *cornua* are preserved, either open (as on a conch trumpet or horn) or restricted (as on a modern trumpet or trombone), this important part is missing in most of the *litui* that have been recovered.¹⁵⁶⁸ These mouthpieces may have been made of perishable materials such as wood or bone.¹⁵⁶⁹

Finally, some horns can be added to the list of wind instruments from the Etruscan area that are made of ivory or clay.¹⁵⁷⁰ One ivory example is from Palestrina¹⁵⁷¹ and another possible one¹⁵⁷² is from the tomb mentioned above in Populonia.¹⁵⁷³ In addition, at least two clay horns are known: one from Civita Castellana¹⁵⁷⁴ and one from Montereggi.¹⁵⁷⁵

Fig. 30.2: Aerophones (no. 6), plectra (no. 7), chordophones (nos. 8–10) and idiophones (no. 11): No. 6 (a) *Situla* of Providence, Museum of the Rhode Island School of Design; (b) urn inv. no. 281, Guarnacci Museum, Volterra; (c) stone base inv. no. 2248, Archaeological National Museum, Chiusi; (d) Bronze inv. no. 470, British Museum, London. No. 7 (a) Plectrum from Caere; (b) plectrum, National Museum of Musical Instruments, Rome; (c) plectrum from Tarquinia. No. 8 Tomb of

1.3 Flutes

The last two aerophones to be included in the archaeological record of Etruscan civilization are the Pan flute or syrinx (Fig. 30.2.6) and the transverse (or side-blown) flute. The former is depicted in the Tomb of the Jugglers in Tarquinia and on some carved urns from Volterra, a stone base from Chiusi, and some bronze objects like the *Situla della Certosa* and the Cortona lamp.¹⁵⁷⁶ The latter is likely represented on one of the aforementioned late urns from Volterra¹⁵⁷⁷ (end of the third century), and certainly on a late sculptural urn (around 100 BCE) from Perugia.¹⁵⁷⁸

2 String instruments (chordophones)

Although the family of wind instruments is by far the most often mentioned in ancient sources, the most represented group in iconography, and seemingly the dominant player in the Etruscan soundscape, string instruments are also widely attested. Remnants of such perishable instruments are not known, or not yet identified, but several plectra, usually made of ivory and displaying elaborate shapes (Fig. 30.2.7), have been discovered in burials from various sites, such as Caere,¹⁵⁷⁹ Tarquinia,¹⁵⁸⁰ and Vulci,¹⁵⁸¹ spanning a period from the first half of the seventh to the first half of the sixth century.¹⁵⁸²

All of the string instruments represented in Etruscan iconography belong to the same family as the Greek *lyra* (Fig. 30.2.8), *barbiton* (Fig. 30.2.9), and *kithara* (Fig. 30.2.10), which are instruments composed of a hollow body—the soundbox—as resonator,¹⁵⁸³ with two arms coupled by a crossbar—the yoke—fixed across their upper part, and provided with strings of equal length.¹⁵⁸⁴ The earliest depiction of an instrument of this kind, a sort of proto-*kithara* (or a *phorminx*)¹⁵⁸⁵ with seven strings and played with a plectrum, appears on one of the oldest painted figural vases found in Etruria. It is an outstanding amphora, probably from Caere and dating to c. 670, and is attributed to a painter fittingly known as the Heptachord Painter (Fig. 16.3).¹⁵⁸⁶ Another odd-shaped chordophone is shown on the aforementioned *Situla della Certosa*¹⁵⁸⁷ along with the syrinx, but the main types depicted so often on tomb paintings,¹⁵⁸⁸ and represented on a great number of objects of Etruscan origin,¹⁵⁸⁹ have the usual features of the Greek models and clearly indicate their extensive adoption. The exception to this rule is the imposing “concert kithara” so often painted on black- and red-figure Attic vases, which

was probably known, but not really used, by the Etruscans.¹⁵⁹⁰

3Percussion instruments (idiophones and membranophones)

The instruments usually included in the percussion family are of two different types—the idiophones, which create sound primarily through the instrument's vibration set in motion by various actions (hitting, shaking, scraping, plucking, rubbing, or moving air),¹⁵⁹¹ and the membranophones, which produce sound primarily through a vibrating stretched membrane, namely drums.

3.1Idiophones

The oldest sounding tools from the pre-Etruscan period are the pear- or gourd-shaped clay rattles, decorated with thin sheets of tin, from the Early Iron Age burial sites of Tarquinia and Verucchio, dated to around 900.¹⁵⁹² Several rattles of similar shape and size, very often decorated, have been discovered at various sites in central Italy;¹⁵⁹³ most of these are made of clay except for one pre-Etruscan bronze specimen from Veii¹⁵⁹⁴ and some other bronze rattles from various Etruscan sites.¹⁵⁹⁵ In addition, some small bronze idiophones, such as bells,¹⁵⁹⁶ *tintinnabula* (Fig. 30.2.11),¹⁵⁹⁷ and other sounding objects,¹⁵⁹⁸ have been found in Etruscan sites but none of these instruments is represented elsewhere or mentioned by ancient sources. The only type of idiophone that is clearly and widely represented in iconography is a sort of large thick castanets which, after the Greek term, the Latins called *crotala*. They are always shown being played by dancers, and are depicted on tomb paintings,¹⁵⁹⁹ carved on Archaic funerary urns from Chiusi,¹⁶⁰⁰ and displayed on various artifacts, particularly on some bronze finials in the shape of dancing statuettes.¹⁶⁰¹ The *crotala* may have been made of perishable material like wood, because no surviving example is yet known.

3.2Membranophones

Notwithstanding the wide diffusion of membranophones all around the Mediterranean area during the same period—particularly the frame drum—called *tympanon* in Greek and *tympanum* in Latin, this class of instruments is the most puzzling and elusive aspect of the Etruscan musical tradition. No evidence of this instrument exists in the archaeological record, not a single

mention is made by Greek or Latin authors, no surviving depictions in tomb paintings exist, and it would appear that the Etruscans seldom depicted frame drums—or any other kind of drum—anywhere else. Few red-figure vases that show a *tympanum* appear to be from Etruscan workshops;¹⁶⁰² other vases from the same period depicting *tympana* are to be found in Tarquinia,¹⁶⁰³ Tuscania,¹⁶⁰⁴ Orvieto,¹⁶⁰⁵ and other Etruscan sites,¹⁶⁰⁶ but all of them were probably produced in the workshops of émigré Faliscan painters, and this population, though geographically close and related to Etruria, is ethnically distinct. If the Etruscans were beating their drums, they indeed have kept that beat secret for a long time.¹⁶⁰⁷

31 Etruscan gold dental appliances

Abstract: Dental appliances and retention bands, the forerunners of modern dental bridges (pontics), were invented by the Etruscans over 2,500 years ago. The earliest known example, from the ancient site of Satricum in Latium vetus, dates to ca. 650 BCE. Most of the known examples derive from Etruscan archaeological contexts in Italy. Some retention bands and complex bridges appear to be Roman adaptations of Etruscan technology. Etruscan forms went out of use as their culture was dominated and then absorbed by the Romans.

A significant recent discovery is that the Etruscan appliances were worn only by females, suggesting that cosmetics and vanity was the principal “dental” concern of these people. Also newly recognized is the specificity of the Etruscan pontics within the southern Etruscan region. The limited distribution of dental appliances provides a warning regarding attempts to view women’s roles as similar across the widely divergent cultures that were all part of the Classical world. In turn, these specific data make clear the wide variations in gender roles present throughout the ancient world.

Keywords: gold dental appliances, dental pontics, Etruscan women, ancient medicine

Introduction

Ancient literary sources include many references to gold dental appliances. These were well known long before the first actual example was recovered from an archaeological context at the end of the eighteenth century.¹⁶⁰⁸ Etruscan goldsmithing skills are well documented in numerous outstanding publications,¹⁶⁰⁹ but their primacy in applying these arts to “dentistry” is less well known. More than 2,600 years ago, Etruscan goldworking talents were used to fashion complex cosmetic dental appliances, some of which had therapeutic value as well. Recent discoveries in physical anthropology, archaeology, the ancient literature, and social anthropology enable us to reexamine and understand specific aspects of the lives of southern Etruscan women. In turn, the written accounts and the archaeological record relating to other aspects of Etruscan life can be reviewed and further investigated.

Since 1885, an extensive literature has emerged dealing with the subject of these ancient appliances. Recent evidence indicates that the earliest examples date from the seventh century BCE. Nearly a dozen ancient dental appliances, in an amazing variety of shapes and sizes, are now known.¹⁶¹⁰ All appear fashioned from natural gold, which generally has a high silver content.¹⁶¹¹

While frequently cited by archaeologists, these ancient prostheses tend to be a subject more frequently discussed by dental or medical historians. Since

Victor Deneffe's early effort, we have seen a considerable number of inventories emerge, and Mario Tabanelli attempts a true catalogue.¹⁶¹² Assembling a complete corpus of Etruscan and other ancient dental appliances permits an evaluation of all aspects of this type of ancient technology. Dental as well as other ancient prosthetic devices are reviewed by Lawrence Bliquez, who also presents specific information regarding various dental prostheses and their history.¹⁶¹³ The Bliquez inventory includes many of the best available photographs of these items.¹⁶¹⁴

Very little archaeological data relating to these prostheses is known.¹⁶¹⁵ Descriptions of the prostheses themselves are generally so poor as to foster errors in the literature. These various difficulties can be remedied only by detailed studies of each of the appliances. Don Clawson began careful studies of the limited dental and skeletal materials found in association with these prostheses.¹⁶¹⁶ His efforts, plus a review of the limited archaeological data, have provided new views of this subject.¹⁶¹⁷ Also important in understanding the contexts within which these appliances were made and used is the literary evidence¹⁶¹⁸ and the relationship of practitioners of medicine to those who performed dental extractions.¹⁶¹⁹ Collectively, this evidence provides an indication of how widely available this type of prosthetic device was to the ancient Etruscan elite,¹⁶²⁰ and later to the Romans, reflecting a long history which can be documented archaeologically. The manufacture of dental appliances clearly was a skilled activity of goldsmiths or other craftsmen, rather than the work of barbers or physicians.

1History: The origins of dental appliances

The earliest records of "dental care" appear in Egyptian medical papyri of the seventeenth and sixteenth centuries BCE.¹⁶²¹ These texts, however, relate only to medical treatments of the mouth and gums; references to dental prostheses are entirely absent. Many Egyptian texts long predate the Hippocratic corpus but are important in understanding the early history of dental medicine. Treatments for oral diseases long predate the development of dental appliances, which first emerge in the Etruscan world in the seventh century.¹⁶²²

Dental prostheses from Near Eastern regions all date to the fifth century or later.¹⁶²³ Vincenzo Guerini suggested that the Egyptians may have decorated teeth with gold after death, but he recognized that they produced no dental prostheses.¹⁶²⁴ The Near Eastern prostheses were all fashioned from gold or silver wire and were intended to stabilize loose teeth. The ancient Near Eastern technique was still being used in European and North American dentistry well into the twentieth century.

François Emptoz's outstanding summary of the evidence reveals that in

1914 Hermann Junker found what was called “wired teeth” in a tomb at Giza dating from 2500 BCE.¹⁶²⁵ Emptoz concluded that these “teeth” were actually an amulet, and I concur. The supposed primacy of Egyptian or Phoenician dental appliances¹⁶²⁶ is nowhere supported by direct evidence. Clawson put it best when he stated that “contrary to the beliefs of various writers,” whom he cites, “detached archaeological specimens of Egyptian prosthetic dentistry do not seem to exist.”¹⁶²⁷

The precise origins of dental appliances predate the sixth century. By 630 BCE, a high- status resident of ancient Satricum was buried wearing a complex and sophisticated gold dental appliance.¹⁶²⁸ This find suggests that skills in the production of dental prostheses extend at least back to the middle of the seventh century. The archaeological evidence spanning the next few hundred years has revealed the general availability of such gold prosthetic devices in Etruria. The number buried in tombs is indicated clearly by the many examples which survive,¹⁶²⁹ as well as a specific reference to them in the ancient Roman literature; in the Law of the Twelve Tables. This law sought to restrict the burial of gold dental appliances with their owners, perhaps to reduce mortuary ostentation but also to discourage tomb looters.

The Etruscans were the first to develop true dental bridges (pontics). These devices generally provided a distinct ring or separated space for each tooth and were anchored to sound teeth. These appliances usually provided the means for replacing one or two missing teeth. Quite interesting, however, is the fact that no examples of gold bridgework appear to survive from the period of the later Roman Republic or the Empire, although literary references clearly attest to their presence. Bliquez rightly dismisses Guerini’s suggestion that by the Late Republic, full sets of removable dentures were being produced.¹⁶³⁰ Even if this were the case, a demand for bridges would have continued, and later examples should be known. Roman prostheses were being removed before burial, or were looted from graves. Poor documentation when recovered may have led to the inclusion of examples in the corpus without appropriate archaeological documentation that would allow us to assign a correct date.

2Functions

While all the known Etruscan dental appliances appear to be cosmetic, the later Roman examples generally were functional. A few simple gold bands, in the form of long ovals, are known from Etruscan as well as Roman contexts, but no dates can be assigned to them.¹⁶³¹ The lengths of these bands indicate that three or more teeth were circled by a single loop. Some of the simple bands may have been purely ornamental, but others may have been used to stabilize teeth loosened by a blow or by periodontal disease. Both cosmetic

and functional dental appliances are mentioned in the ancient texts.¹⁶³² The Etruscan examples of dental bridges are particularly interesting because they uniformly replace one or both upper central incisors.¹⁶³³ Since these teeth are the least likely to be lost naturally to decay or periodontal woes, the evidence strongly suggests deliberate removal.¹⁶³⁴ Deliberate extraction (evulsion) of incisors is a common cultural practice around the world, although Italic examples are less well known.¹⁶³⁵ These cosmetic appliances, designed to fill the gap left by teeth deliberately removed, would also serve to maintain the remaining teeth in their correct places, although it may not have been an intended feature of the appliances. A well-fitted ornamental false tooth would assure continued proper articulation of the remaining teeth and their continued efficient function. This is one of the principal goals of modern orthodontics. The individual's own teeth, deliberately removed, could be recycled by being cut down and fitted into the appliance inserted into the owner's mouth. "Recycling" one's own teeth would also guarantee a correct color and size match.¹⁶³⁶

The Latin poet Martial (ca. 39 – ca. 103 CE) indicated that various substitutes for human teeth were commonly employed in antiquity, such as bone or ivory (Spect. 1.72). Even the tooth of an ox is incorporated into one Roman appliance. I agree with Bliquez and others that goldsmiths, ivory carvers, and other artisans fabricated these appliances.¹⁶³⁷ The makers fitted these devices as cosmetologists, independent of the dentists, who did extractions, or the physicians, who prescribed for diseases of the mouth.

Fig. 31.1: Etruscan gold dental appliance. Already collection R. Aichmeir, Linz (photo R. Aichmeir)

An Etruscan dental appliance maker required the skills of a goldsmith who

could also fashion the false teeth and do the fitting (Fig. 31.1). Such a person would have been an extremely talented craftsman. Knowledge of tooth shapes and the fitting of gold bands to them is highly developed in the Copenhagen example. When well installed, a complex appliance provided a much better fit and greater stability for the teeth than is achieved through the use of a single long gold band. The individual rings of the appliances provide us with a direct indication of the measurements of the anterior teeth of the individuals who wore these appliances. These measurements are uniformly within the range of Etruscan female dentition.

3The Copenhagen bridge: A unique ancient dental pontic

The best described of all the surviving examples of Etruscan dental appliances is the example in the Department of Near Eastern and Classical Antiquities, Danish National Museum, Copenhagen. This piece serves as a good example of ring-constructed Etruscan pontic. The Copenhagen specimen, believed to have come from Orvieto, was known as early as 1927, when it was probably found in a major tomb.¹⁶³⁸ It was mentioned or illustrated thereafter by several authors.¹⁶³⁹ Detailed descriptions of the appliance and the associated teeth became available more recently.¹⁶⁴⁰

The Copenhagen appliance is a complex variation of a simple gold band type that was meant to encircle several teeth. There are at least four variations in construction among the score of dental appliances known.¹⁶⁴¹ The Copenhagen appliance was assembled from three small separate gold rings, or “loops.” Each of the three loops of the Copenhagen appliance is seamless, formed by drawing out a ring from a solid piece of gold or by making a small loop from a strip of gold by cold welding the ends.¹⁶⁴² The lateral loops were then joined at their adjacent surfaces by invisible cold welds. The lateral loops were curved in such a way as to conform to the base of each dental crown, with specific fitting done after the false tooth had been set in place and the appliance was ready to be inserted. The three small gold loops were then carefully fitted or custom designed to surround both “anchor” teeth and the false tooth, now missing. Anchor or “post” teeth are the sound or living teeth to which the bridge was attached to hold it in place. This appliance, like all the Etruscan examples, was meant to be worn in the upper jaw of an adult female. The lateral loops in this example were fitted over the upper left central incisor (I1) and the right lateral incisor (I2), with the right central incisor (I1) being “replaced.” No rivet was used to hold the false or replacement tooth in the center ring of the Copenhagen appliance, although this was the most common method used in other Etruscan examples.

The central band was formed as a sharply rectangular “box.” The

replacement tooth, either the one deliberately removed or a substitute of ivory or bone, would have been a “crown” only. If not the cut-down (root-removed) original, this replacement would have been carved with its upper, exposed portion mimicking the tooth that it replaced. The lower part or base of the false tooth was square-cut to fit into the “box.” The angular shape would prevent it from slipping or rotating in its fitted collar. No rivet (pin) was needed since the false tooth was held in place the way a gemstone is fixed in a setting: this small rectangular band held the false tooth just as a goldsmith would insert a gem into a bezel setting. The false tooth was secured in place by pressing the soft gold tightly around it. The bridge has a design remarkably similar to modern examples. The appliance was meant to be a permanent fixture, although direct use of the replacement tooth would loosen the appliance. The Copenhagen-type pontic was more effective than bridges incorporating only a single long band with teeth riveted into position in the center, as in the Liverpool examples.¹⁶⁴³

Anthropological techniques provide new means of interpreting the considerable body of existing evidence from the Classical world. Recently collected biological data relating to these appliances plus the use of cultural models provided by social anthropologists enables us to decode this extensive array of data in ways that make clear aspects of gender roles present in ancient Etruria. A detailed description appears elsewhere,¹⁶⁴⁴ but of particular interest here are the measurements of the three teeth involved, as indicated by the dimensions of the gold rings and the portions of teeth that survive. These can be inferred both from direct measurement as well as by comparison with photographs taken when the associated teeth were better preserved.¹⁶⁴⁵ Direct study of the anthropometric data reveals that these dental appliances were worn only by women.¹⁶⁴⁶ This is evident from the size of the teeth involved. These are in the female range, much smaller than the teeth of males in this same population. Based on comparative dental wear, the woman represented by the teeth in the Copenhagen appliance appears to be over thirty years of age, but probably under fifty.

These comparisons are possible because we now have available extensive dental information from a central Italic Iron Age population.¹⁶⁴⁷ More specifically we now have considerable dental data from later periods at the southern Etruscan city of Tarquinia,¹⁶⁴⁸ where the greatest concentration of these appliances was found. The evidence clearly demonstrates that only women wore these appliances. The gendered use of these appliances is reinforced by the archaeological evidence from one of the two known contexts for which any excavated evidence had been recorded. Obviously, the actual measurements of the involved teeth are more clearly documented from the individual loops of the pontics than can be inferred from gold bands. The possibility that dental loss was a result of leprosy has been considered, but rejected due to the gender specificity of the known examples.

4Discussion

Comparison of the newly available evidence from the Etruscan skeletal record¹⁶⁴⁹ also indicates that the loss of upper central incisors, the teeth most commonly replaced by these Etruscan pontics, would have been an extremely rare phenomenon in women under the age of sixty.¹⁶⁵⁰ This correlates with other evidence suggesting that the deliberate removal of healthy incisors from these women was necessary to enable these decorative appliances to be worn.¹⁶⁵¹

These discoveries bring us back to the literary evidence, and in particular to the many ancient texts indicating that Etruscan men and women dined together. Etruscan gender relationships were unlike those of the Romans and Greeks, who practiced gender “avoidance” while eating and saw the Etruscan cultural form as disturbing (see [chapter 14](#) Colivicchi). Like the Etruscan use of decorative dental appliances, these dining customs faded as the Roman Empire altered the behaviors of the Etruscan elite in the first century BCE.

Long ago, Rodolfo Lanciani noted that the tombstone of an ancient Roman dentist named Victorinus had an instrument of his trade depicted on it—a pair of dental forceps.¹⁶⁵² Other medical practitioners in Rome, of both Greek and Roman origin, also had similar tools shown on their funerary monuments.¹⁶⁵³ The numerous medical kits known from antiquity, however, do not include the specialized tools that are needed by the goldsmith. Nor do we find any literary evidence that suggests that gold dental appliances were fashioned by any of the people more directly involved in the medical arts.¹⁶⁵⁴ We can also reject the thesis that any of these appliances was used to effect a deliberate shifting of teeth. Orthodontics is clearly a twentieth-century invention dependent on modern developments in metallurgy and other areas. Dental implants were also made possible only by later twentieth-century technology.¹⁶⁵⁵

A distribution map of ancient dental appliances demonstrates that this technology appears to have been concentrated in southern Etruria.¹⁶⁵⁶ The few examples found beyond the borders of this specific part of ancient Etruria can be explained by two factors relating to the movement of the Etruscan women wearing these appliances. These women may have been buried outside their native territories as a result of high-status marriage alliances between upper class Etruscan mercantile families and foreign trading partners; or they may have been accompanying their husbands who ventured beyond their homeland while conducting the business that made the Etruscans wealthy. These inferences are but a small part of the complex patterns that can be reconstructed through a detailed study of the surviving corpus of dental appliances.

The evidence also suggests that the use of these appliances was not a cultural custom found throughout the Etruscan realm.¹⁶⁵⁷ Unless there were radically different mortuary patterns in central and northern Etruria, perhaps involving the removal of such appliances from the deceased, we must

conclude that this technology was a part of the ornamentation of women primarily found in southern Etruria.

Of considerable interest is the evolution of this technology. The earliest dated example of a dental appliance is the Satricum appliance, from no later than 650. This has a hollow gold tooth attached to a thin band and is the only one to use a gold replacement tooth.¹⁶⁵⁸ Since we have no evidence to indicate that this hollow-tooth technique was ever repeated, we may conclude that it was soon discontinued. This suggests that by 600 the use of false teeth—human, or carved to look like natural teeth—had become the fashion. This appears to relate to the finding that where a specific evaluation of gender has been made, all those wearing these gold bands were women.

At this time we have no means of dating most of the gold dental appliances known from ancient Italy. However, as Mary Johnstone indicated, the Etruscans clearly were the first to construct true dental bridges.¹⁶⁵⁹ The tentative sequence for these dental appliances suggests a constant, if slow, development in the techniques of applying dental bridges. Any apparent improvement need not reflect chronological aspects of ancient dentistry. The use of a more successful method of fitting a dental appliance may reflect only the greater concern of this “dentist,” or the greater skills of a goldsmith who was fashioning the bridge. Various examples suggest that a few talented individuals may have carried their craft to unusual heights, but those achievements did not continue after the decline of ancient Rome, being reinvented centuries later by modern practitioners. If the Copenhagen bridge represents an evolved form of dental appliance within the ancient world, then we can see a stage from which the next logical step would be the formation of a solid gold tooth which might have mastication among its functional aspects.

5Conclusions

- 1.The earliest pontics were made by Etruscans solely for decorative purposes. Any influence they had in retarding the shifting of teeth would have been purely coincidental.
- 2.The deliberate evulsion of teeth was fundamental to the process of providing a place to install these pontics, a pattern very different from the modern concept of preservative dentistry.
- 3.Only women wore these appliances, and perhaps only in southern Etruria.
- 4.Gold bands or braces that had no false teeth attached may have been employed for functional reasons, such as to prevent the movement or loss of teeth loosened by a blow or by periodontal disease.

Acknowledgements

My most sincere thanks are due Dr. Jean MacIntosh Turfa and the many people who facilitated studies of Etruscan dental appliances at the museums where they are now found. Special thanks are due to Prof. L. Bliquez for sharing his extensive data during all phases of this research. Partial funding for aspects of this research was provided by a series of small travel grants awarded by the College of Arts and Sciences at West Chester University. The aid of Profs. D. McConatha and Martin Murphy is particularly appreciated. Thanks are due to the late Prof. Adele Ré and other Italian colleagues for help at various points in these studies. Thanks also are due to the Members of Congress of the United States of America for their support of tax laws that stimulate and encourage research in this and other areas of inquiry. The ideas presented here, as well as any errors of fact or interpretation, are solely my own responsibility.

Part 2: **III. History**

Adriano Maggiani

32The Historical Framework

Abstract: To adequately follow the long itinerary of the Etruscans, it is necessary to go back to the End Bronze Age (twelfth-tenth centuries BCE), a time when there were many different cultures in the Italian peninsula, among which, the Proto-Villanovan occupied a large part of central Italy. It is likely that the bearers of this and other contemporary cultures corresponded to many ethnic groups. At the beginning of the Iron Age (1000–730), the communities of tiny villages of central mid-Tyrrhenian Italy came together in large inhabited centers, called “proto-urban” in the literature, which correspond to the Etruscan cities. The material culture of these centers also diffused into other regions of the peninsula, such as Emilia-Romagna (around Bologna and Verucchio), the Marches (Fermo), northern Campania (around Capua), southern Campania (around Pontecagnano and Sala Consilina), which can be interpreted equally as districts of Etruscan culture, each with its own history. Thanks to a strong inclination toward commerce and long-distance relations, these communities came into contact with other cultures that existed on the peninsula and in adjacent regions, both north of the Alps and along the Mediterranean coasts. The exploitation of the extraordinary natural resources available in Etruria led to the flourishing of the Orientalizing culture (730–580). In the western Mediterranean, this saw the arrival of goods, men, and ideas from the eastern Mediterranean and the Near East. In this period, gentile aristocracies made their name, using their family names to underline their membership in that group. In the Archaic period (580–450), the individual cities promoted their relations with regions beyond the Italian peninsula and began the flow of commerce especially toward Gaul and northern Africa. An encounter with the Greek world, represented especially by the colony of Syracuse, became inevitable. The naval battle won by the Syracusans at Cumae brought about a new balance of power in the western Mediterranean. In the Classical and Hellenistic periods (450–250), encounters with the Greek world continued, and they had to confront the Gauls, who had penetrated central Italy, and the growing power of Rome. The skillful policies carried out by the Roman republic, which knew very well how to exploit the fragile cohesion of the Etruscan world, conquered one city after another, bringing about the loss of political autonomy for the Etruscans, who were assimilated into the world of Rome (250–90), sharing the internal vicissitudes.

Keywords: Late Bronze Age, Iron Age, Archaic period, Hellenism, Republican period

Introduction: An Etruscan history

When Dionysius of Halicarnassus wrote the early history of Rome at the end of the first century BCE, Etruria had for about a century been a part of the Roman state, along with all the other ethnic-geographic regions of the Italian peninsula. But unlike these other peoples, the Etruscans appeared in the eyes of the historian to be a population unlike any other in language, religious customs, and culture. This Etruscan deviation, the historian goes on to tell us,

had favored the proliferation of various traditions on the origins of the people, most of which claimed that they were immigrants to the peninsula, whereas Dionysius himself was inclined to consider them autochthonous (Dion. Hal. *Ant. Rom.* 1.30).

The Etruscans themselves had developed a tradition concerning their genesis as a people. According to Varro¹⁶⁶⁰ in the *Tuscae Historiae*, written in the eighth century of the Etruscan calendar, or the second century BCE, it was made known that the people of Etruria had all ten *saecula* of existence, and it was specified how many had elapsed and how long they would continue to exist. The calculation reported by Varro anticipated on the whole a duration of seven “centuries” already passed (a *saeculum* was a measure of time that was not fixed, but variable, calculated according to the lifespan of the longest-lived man in any generation) amounting to 761 years; the eighth “century” was in progress when the *Historiae* were written; two more “centuries” remained before the *nomen etruscum* would come to an end. This tradition, which is also mentioned by Dio Cassius (57.18.3–5), Plutarch (*Sull.* 7), and the *Suda*,¹⁶⁶¹ was accepted literally as fixing the beginning of the *nomen*—that is, the moment of the onset of a self-aware ethnic group; roughly speaking, in the tenth century bce. This is a date that in terms of the major temporal divisions of modern proto-history coincides with the last gasp of the Bronze Age.¹⁶⁶²

1 From the Bronze Age to the Iron Age (10th cent-730 BCE)

1.1 From (apparent) homogeneity to differentiation

The Late Bronze Age was dominated in Italy by an ensemble of archaeological *facies*, that have in common a certain number of uniform characteristics, which has been given the name “proto-Villanovan.” Behind this label, however, a variety of realities are concealed.

Archaeological research has identified many independent regional typological groups, which paved the way for clearer distinctions that characterized the Iron Age that followed. To grossly oversimplify, we can say that many of these groups or local *facies* (roughly, archaeological horizons) developed uninterruptedly into the Iron Age and beyond. Definite phenomena of continuity are found, for example, in some parts of northwestern Italy (from where it passed from the *facies* known as “Proto-Golaseccan” of the Late Bronze to the Golaseccan culture of the Iron Age) and of northeastern Italy (from the previously defined “Proto-Venetic” culture to the Venetic), and in Latium as well (phases I—II of the “Latium culture”).

The situation is more complex in central Italy, where there was a distinct Mid-Tyrrhenian *facies*, which in turn included five local groups. Among these, the southern boundary of the Tolfa-Allumiere group, located in northern Latium and southern Tuscany, is marked by the Tiber, while to the north it is defined by a line from Bisenzio to Sovana and the course of the Fiora. Farther north, a distinct typological group has been identified called the “Cetona-Chiusi,” which included inner Tuscany and part of the Umbrian area including Perugia and Spoleto, and presents noteworthy connections with the coast of the Marches. In northern maritime Tuscany, cultural aspects are outlined less clearly, but with some connections with the Cetona-Chiusi group.

The recognition of this dichotomy in the cultural aspects of the Late Bronze Age in the territory that would become Etruria proper is of great interest, in that it seems to have an exact counterpart in the following historical age. Between the Arno and the Tiber, that is, it is possible to distinguish already in the Late Bronze two great cultural regions that coincide impressively with what in the historical age would become northern and southern Etruria, differentiated not only by aspects of the material culture, but also by features of their language and script.

1.2 Continuity and discontinuity

If from the point of view of the material culture there were undeniable elements of continuity between the Proto-Villanovan and the Villanovan of Etruria, the panorama of the population between the Bronze Age and the Early Iron Age in this area is characterized by a clear change in the style of settlement. In fact, it went from many small “Proto-Villanovan” hamlets to a very few substantially sized built-up locations placed in strategically important spots, where several hundred individuals might gather, which coincide in large part with the historical cities of Etruria. These new major complexes have been called “proto-urban centers,” a term that is ambiguous but has nevertheless entered the lexicon. The phenomenon, which undoubtedly represents a traumatic and epochal event, especially because of its simultaneous appearance everywhere in the territory that would later become Etruria, might have had various causes; in any case it presupposes a very powerful authority able to garner a broad consensus.

Another element that distinguishes the two periods involves funerary practices. In the necropolises from the end of the Bronze Age, there are signs of a degree of social diversity (the aristocracy that Ferrante Rittatore Vonwiller recognized in the burial tumuli of Crostoletto di Lamone), but in those of the beginning of the Iron Age a pronounced egalitarianism predominates.

At the same time as the phenomenon of synoecism (Gk. *synoikismós*, amalgamation of villages), a transformation seems to have taken place from

an economy in which the land and livestock were property of the community, typical of the Bronze Age, to an economy dominated by private possession of land by hereditary title (the Romulean *heredium* appears to be its mythistorical variant).

Like many of the great historical cultures, the Etruscan culture began to get under way at the end of the Bronze Age. In this case, however, the distinctive element appears to be the phenomenon of synoecism, which characterizes the dawn of the Iron Age, not only in southern Etruria but in the northern region as well, as shown by the examples of Populonia, Volterra, Chiusi, and Vetulonia.

The cultural continuity in the aforementioned regions (Piedmont, Veneto, Latium, Etruria) becomes especially significant when these different ethnic groups acquire a writing system that takes on individual linguistic and ethnic properties: a series of linguistic and cultural areas become clearly defined. All the Italic languages (Lepontic, Venetic, Umbrian, Latin) appear to have surrounded the region where Etruscan was spoken.

An assertion by Renato Peroni is in the writer's opinion perfectly convincing: "Local (typological) groups and ethnic components represent without any doubt incommensurable concepts: the cases of several groups existing within just one ethnic component and, on the contrary, of several ethnic components coexisting within a single group must constitute not the exception, but the rule."¹⁶⁶³

This hypothesis is perfectly consistent with the more than likely coexistence of a variety of different ethnic entities within the individualized typological groups in the Late Bronze Age, as appears clear in the case of the Cetona-Chiusi group that was intimately connected with the Umbrian environment. The fecundity of this original perspective is also demonstrated in its ability to reflect the presence of elements of different origins in the cultural manifestations of Etruria in historical times. A specific case, but one that is quite significant, is that of the Etruscan pantheon, known to us in its most complete formulation in the late Hellenistic age. In the religious lexicon of the Etruscans, it is possible to explain groups of theonyms that betray foreign provenience in their linguistic form. Alongside a prevailing core of divine names clearly of Etruscan origin, there are many others for which an Umbro-Italic origin has long been proven, to which are added a tiny component of Greek names. This is surprising when we recall the enormous acculturating influence that Greece had had over Etruria beginning at least in the middle of the eighth century. It can be inferred that in the eighth century there already existed an Etruscan pantheon as an organized system of names of gods, which had prevented or made it extremely difficult for Greek theonyms to infiltrate. The historical dynamic of this phenomenon is perfectly reflected in Peroni's model. Different ethnic and cultural components were gathered to give life to the new style of territorial organization—the proto-urban center—within which the various groups naturally bear their own

cultural characteristics and naturally their own gods.

To this reconstruction can be wedded the picture painted by ancient historiography of the foundation of Rome, which resulted from the concatenation of various groups of Latins, and a little later was completed with the induction into the civic body of the Sabines by Titus Tatius, who brought with him his own gods, as recorded by Varro. Varro thought (being of Sabine heritage) he was still able to name them.

That in Etruria the motivation of this phenomenon went back to the Late Bronze or the Early Iron Age, seems to be proven by the characteristics of the Proto-Villanovan of northern inner Etruria; as indicated above, the Cetona-Chiusi group was part of a much wider cultural division into which Umbria was thoroughly integrated. The hypothesis formulated on the basis of the pantheon turns out to be nothing more than hypothesizing that the territorial plexus covered by the Chiusi-Cetona *facies* would already have displayed ethnic variation within itself.

To the objection that this sort of picture does not mirror the linguistic unity of this great cultural division (because in historical times Etruscans spoke Etruscan and not a number of languages or even different languages, e.g. Umbrian?) we may answer once more with the example of the tradition of the founding of Rome. Romulus admitted the Sabines of Titus Tatius, but the language of the city did not become Sabine or even Sabine; it remained Latin.

This might signify that the driving forces of this process of the birth of great proto-urban aggregations were linguistically Etruscan already at the moment of formation—that is, at least since the end of the tenth century.

1.3 The historiographic tradition and the language

Data from archaeology, linguistics, and the literary/historical tradition do not sufficiently agree to furnish a really homogeneous view. A good part of the historiographic tradition, magisterially synthesized by Dionysius of Halicarnassus (1.22ff.), speaks of the Tyrrhenians, who from various locations supposedly settled in Italy. But for some authors it was a matter of Pelasgians, a mysterious migrant people in the Aegean sea, who were felt in some ways to be distinct from—and in other ways identical to—the Tyrrhenians. For one segment of the tradition (Hellanicus of Lesbos, a historian of the late fifth century BCE), the Pelasgians would have landed in Italy at the mouth of the Spinete River to penetrate the interior and conquer Umbrian Cortona (a reflex of this can be seen in the archaeological materials from Frattesina di Fratta Polesine, a great Late Bronze center at the mouth of the Po). According to a different facet of the tradition, the Tyrrhenians would have moved to Italy from Near Eastern locations, from which they would have pursued the Pelasgians or the Umbrians.

The data from the historiographic tradition can, in my opinion, be

connected with the linguistic data.

Probably a non-Indo-European language, Etruscan's sole traces of familial connections are with the language of an Archaic-period stela from Kaminia on the island of Lemnos, and with that of the Archaic inscriptions from the Rhaetic area (central-eastern Alps). The literary sources know of the presence of Tyrrhenians at Lemnos, documented in the seventh century and expelled by the Athenians of Miltiades at the end of the sixth. They also know of the Rhaeto-Etruscans of the Alpine basin, who are supposed to have taken refuge there because of Celtic expansion in Italy. This second tradition, which goes back to the Paduan Livy (5.33.11), is dubious. The sixth-century date of the Rhaetic inscriptions excludes from the discussion any reference to the late fifth-century Gaulish invasion, and probably also that of two centuries earlier, recorded by Livy himself. In fact, the features of the Rhaetic language, like Lemnic, show affinity, but not identity. The differences make us think that the three linguistic groups had undergone centuries of independent evolution.

The connections with Lemnos in the Archaic period have more recently been interpreted, overturning widespread opinion but validating one of the extant literary traditions, as the effect of a move of Etruscans from the peninsula toward the east. This is hardly a legitimate theory from the point of view of epigraphy or linguistics, and all the more unacceptable on the archaeological level. Not a single element connects the archaeological *facies* of the two regions; this appears to be a strange fact for the hypothesis of a displacement of peoples in the fully historical age (seventh-sixth centuries).

On the other hand, it is only by supposing the greatest antiquity of any ethnolinguistic unity among these three entities, the Lemnian in northern Aegean, the Rhaetic in the Alpine region, and the Etruscan in Etruria proper, that the established total lack of any element of connection between the archaeological *facies* of the three environments in question could be explained.

Perhaps the knowledge that the ancients had of the affinity between Lemnian, Rhaetic, and Etruscan ultimately created the theory of the identity of those populations with the Etruscans, giving an origin to the legend of migrations.

Perhaps the entire complex of traditions on the origin of the Etruscans should be regarded, as has been done more recently, as a corpus of stories constructed between the late sixth and the fifth centuries, with the purpose of ethno-political glorification of various actors. There remains the problematic information contained in the Egyptian historical inscriptions of the time of Ramses III, which mention an ethnic group called *Trs-w*, in which there is a tendency to recognize the same linguistic stem as in the Greek name *Tyrsenoi*, but whose interpretation is subject to debate.

These are very exiguous elements with elusive details, but they might give substance to the tradition of a very old connection of the Etruscans of Italy with populations of eastern Aegean.

1.4Synoecism and colonization: Unity in the Early Iron Age

With the beginning of the Iron Age, a noticeable cultural unity characterizes the region that would become Etruria proper—between the Tiber in the south, the valley of the Arno in the north, and the Apennine ridge in the east (Fig. 32.1). It is this cultural unity, characterized by lifeways, burial customs, styles of ceramic decoration, and types of arms and ornaments that has been dubbed the name of Villanovan culture. Until the beginning of the ninth century, other large regions of the peninsula are closely connected to this large, substantially homogeneous area. This area includes considerable portions of Emilia south of the Po and centered on Bologna; Romagna, with its nucleus at Verucchio; the Marches, with the minor center at Fermo (which flourished in the ninth-eighth centuries, but was soon absorbed into the supervening Picene culture); and nearly all of Campania, with Capua and Pontecagnano as its major centers in the north and south, respectively (see chapter 33 Pacciarelli).

None of these regions outside Etruria proper, which in historic times spoke and wrote Etruscan, have significant predecessors in the Late Bronze Age. That is to say, they do not seem to have had important Proto-Villanovan predecessors; instead they appear suddenly, with centers of the proto-urban type, at the beginning of the Iron Age. Different and perhaps unique is the case of northern Campania, where the existence of a typological “Volturno” group in the Bronze Age might constitute a legitimate onset for Etruscan Capua. This has traditionally been interpreted as “colonial” issues from the Villanovan Tyrrhenian region. This theory has been strongly opposed by Renato Peroni and his school, according to whom in every case it was the result of the convergence of groups of various ethnic origins and identities, which would have been assembled within the enterprise of constructing a proto-urban center.¹⁶⁶⁴

Peroni’s model, however suggestive, does not explain the archaeological void at the end of the Bronze Age, which precedes nearly all these establishments, especially in the Po Plain. Hardly useful is the recent tendency to overvalue a few isolated bits of evidence from the periphery of this region—such as the presence of some metal hoards (Poggio Berni, province of Forlì-Cesena)—or of important sites like Frattesina di Fratta Polesine (province of Rovigo), or at the other end of the district, of necropolises like Campo Pianelli at Bismantova, on the western Apennines (province of Reggio Emilia).

From the point of view of typological characteristics, these areas cannot all be looked at in the same way. To be sure, the archaeological *facies* of Bologna, Verucchio, and Fermo on the one hand and of Pontecagnano on the other, while exhibiting individual features, appear to issue directly from the culture of Etruria proper. In other cases such as Capua, the situation appears to have been different. In every case that has been considered, was there really a

great phenomenon of Etruscan expansion into the more fertile areas of the peninsula? Some historiographic traditions elaborated in Etruria, which have survived in extremely fragmentary but still partly interpretable form, can be understood in this way. In particular, the tradition appears important concerning the great north-Appennine expedition that was supposedly led by Tarchon. The name of Tarchon, brother or son of Tyrrhenus, would carry the event back to the origins of the history of the Etruscan ethnic group. Tarchon, according to the testimony of Aulus Caecina, led the army beyond the Appennines, conquering the region of the Po and founding twelve cities, in accordance with a legitimate colonial model.¹⁶⁶⁵

Fig. 32.1: Etruria, 10th cent.-730 BCE (Map by O. Cerasuolo)

No matter how the events of Etruria's earliest history that we have passed in review ought to be understood in detail, what appears factual is the

powerful internal cohesion and the extraordinary ability of Etruscan society to expand at the end of the Bronze and beginning of the Iron Age. This is manifested in the two epochal phenomena of synoecism internally and colonization externally, understanding the latter in the way it was treated above: at least in the south, as the movement not of large numbers of people, but of nuclei of aggregation of local peoples.

In the north, on the other hand, we can more confidently imagine a real colonizing movement, which might have made use of those western trans-Appennine routes that already earlier, in the Late and End Bronze Age, had, by a reverse movement, carried into northern Tuscany strong echoes of the pile-dwelling civilization of northern Italy.

1.5 Projection toward the exterior

The phenomenon seen in the *longue durée* is that which led to the creation of strong territorial nuclei, the future city-states, with a center that dominated over expansion and vast semi-depopulated territory that constituted the base of economic exploitation. A corollary of this phenomenon of expansion is the strong commercial opening with the exterior. This explains the connections with the Hallstatt culture to the north; with the Oenotrian culture, and the area of the pit grave culture to the south; with Sardinia, both with the native populations and with the first Phoenician colonies to the west; and with the Greeks who were beginning to frequent the southern Tyrrhenian sea.

The Greek presence was to become more significant beginning in the eighth century, and certainly would not have been particularly welcomed by the Villano-van centers, especially in view of its frankly permanent character. Sometimes this situation led to conflicts, as emerges from the—albeit scarce—historiographic sources dealing with the early colonization of Sicily.¹⁶⁶⁶

It is by no accident that, with the sole exception of Cumae (and first of Pithe-cusae), Greek colonization was limited to occupying the more southern regions of the peninsula and Sicily. In the western Mediterranean, a Phoenician presence was already active at the time, which covered the coasts of North Africa (e.g. Carthage), southern Spain, the Balearic Islands, and Sardinia with colonies of various sizes.¹⁶⁶⁷

2 The age of aristocrats (730–580 BCE): The Orientalizing period

In the late eighth century, the great proto-urban conglomerates of Etruria were overwhelmed, like the rest of Italy and Greece, by an impressive flow of goods from the east (see [chapter 34](#) Botto). These were brought in especially

by Phoenician sailors, whose ability in this sort of activity is even recorded by Homer (*Od.* 15.415ff.). This was accompanied by an always lively Greek commerce (both Corinthian and insular), including sumptuous ceremonial vessels, such as the gigantic bronze cauldrons on tall supports, of north Syrian origin, the Phoenicio-Cypriote cups and jugs in precious metals, joined in the west by many other objects in ivory, glass, and *faïence*. In the seventh century, the heavy influx of Oriental and Hellenic imports, transported by Phoenician, Levantine, and Greek merchants, strongly conditioned the development of the indigenous societies. This contributed to a very strong acculturation of the elites, which qualified more and more as a princely aristocracy on the Oriental model, while the proto-urban centers would be running their course toward the form of cities (Fig. 32.2).

Contact with the foreigner took place in specific ways, which directly involved the aristocratic elites, as shown by the episode of Demaratus of Corinth, who, according to tradition, in 656 repaired to Tarquinia profiting from relations with the local aristocracy before becoming involved with commercial relations (Plin. *HN* 35.152).

The Early Orientalizing period is an explosive moment. The city-states of southern Etruria, which strengthened their economic bases—for instance increasing control over mineral resources, or rationalizing and intensifying agricultural production—accumulated large surpluses which in part they exported. Vulci began to export wine to southern France already at the end of the seventh century, followed a few decades later by Caere. Veii competed with Rome for control of the Tiber valley and on the routes toward Campania. Vetulonia still paid attention to Sardinia; Populonia kept firm control of the island of Elba; Pisa initiated an expansionist policy toward the north that brought it as far as the Magra on the North Tyrrhenian coast, in an area whose population may already have been Ligurian, while in the hinterland there opened a route through the valleys of the western Apennines. With the end of the Orientalizing period and the beginning of the Archaic, the city-states completed their control over their territory and streamlined trade with foreigners by establishing flourishing trading posts (*emporía*) on the coast, founded by Caere (Pyrgi), Tarquinia (Gravisca), and Vulci (Regisvillae), while farther north Populonia itself acted as its own port city.¹⁶⁶⁸

3The apogee of Etruscan thalassocracy and the confrontation with Greece (580–450 BCE)

3.1The Archaic period

During the sixth century, decisive changes took place. From the late seventh, on these waters Greek ships coming from eastern Aegean sea encroached on Phoenician and Etruscan ships. The earliest of these sailors were certainly the Phocaeans, to whom the historiographic tradition attributes a series of real discoveries. They were the first to open commercial routes in the Adriatic, the first to have passed the Pillars of Hercules to discover the land of Tartessus, and the first to have colonized southern France, founding Massilia (modern Marseille) at the mouth of the Rhône around 600 BCE, and populating the neighboring coasts with sub-colonies. For some decades, it does not seem as though the new colonies damaged the Etruscan wine business in Provence in any way. It seems instead that an initial phase (late seventh and early sixth century) of prevailing Vulci presence in this market was followed by a massive Caeretan presence (Fig. 32.3).

Possibly as a reaction to this situation, a consequence of reduced projection on the sea, in the second quarter of the century the expedition of the Vipinas brothers toward Orvieto and the Tiber valley in inner Etruria took place. The ultimate destination was Rome, where Mastarna, companion of the Vulci leaders, managed to become king under the name Servius Tullius after the defeat of their army, as told by an Etruscan tradition reported, among others, by Emperor Claudius.

In the middle of the sixth century, the Persian advance toward the Greek cities on the Anatolian coast provoked a general disquiet with the ensuing dispersion of the entire population. The situation reached the breaking point. Groups of Phocaeans, abandoning their homeland, took refuge on the east coast of Corsica. Many settled at Alalia (Aleria), where about twenty years earlier they had founded a colony from which they had raided the nearby Etruscans and Carthaginians of Sardinia. The Etruscans and the Carthaginians, having formed an alliance, after an inconclusive naval battle, retained control of the land, obliging the Phocaeans to abandon the island and return to southern Italy (Hdt. 1.166).

Fig. 32.3: Etruria, 580–450 BCE (Map by O. Cerasuolo)

On the level of international relations, the outcome of the battle of the Sardinian Sea led to a division of the Mediterranean into spheres of influence.

Sardinia remained the exclusive possession of Carthage, and Corsica of the Etruscans, who established a colony, which Diodorus Siculus gives as Nikaia (Diod. Sic. 5.13–14), probably to be identified with Alalia itself.

In external politics, the city-states obviously had the utmost liberty. The alliance between Caere and the Carthaginians to eliminate the Phocaeen bridgehead from Corsica led to good and stable relations between the two cities, which was familiar to Aristotle (*Pol.* 3.5.10–11), and which had a parallel in contemporaneous negotiations undertaken by the Semitic power with Rome. It is not surprising that at the end of the sixth century, Thefarie Velianas, the king of Caere, would give concreteness to these relations by accommodating Astarte, the principal goddess of Carthage in the sanctuary of Pyrgi, setting forth an unspoken identification with the principal goddess of the sanctuary, Uni.

If a Semitic presence is particularly emphasized in the port of Caere, at Gravisca the East-Greeks and then the Aeginetans left the most traces of their presence in the sanctuary near the port (see [chapter 35](#) Cerchiai).

Farther north, on the initiative of the cities of northern Etruria, and perhaps especially through the activity of Pisa, the colony of Genoa was founded in the land of the Ligurians, with a fortress commanding a commodious landing site. In inner northern Etruria, Porsenna, who had become king of Chiusi, probably preferred by the growing political weight of the *demos*, followed a policy of territorial expansion, which led him to annex the nearby territory of Volsinii (Orvieto) (Plin. *HN* 2.140). Later, taking advantage of the request for aid by the deposed Tarquinius Superbus, he fell on Rome, occupied it, and made it a base with the intent of overcoming the hostility of the Latins to open a highway toward Campania. But, defeated in 504 at Ariccia, he withdrew to Chiusi.

3.2 The fifth century and the power of Syracuse

The end of the sixth century coincided with a period of heavy conflict between Etruscans and Greeks, especially on the waters north of Sicily, for control of the straits. The unstoppable advance of the Persian Empire in Asia permanently changed the geopolitics of the eastern Mediterranean, provoking further movements of population to the West. One of the points of friction is precisely the area between the Tyrrhenian and Ionian seas. One long season of conflict opposed the Etruscans to the Greeks who had occupied Lipari.

Meanwhile, Carthaginian power pressed the Greek cities of Sicily. Ancient historiography, extolling them as episodes of the Hellenic victory over barbarism, paralleled the defeat of the Persians at Salamis by Athens and the defeat of the Carthaginians at Himera by the tyrants of Acragas and Syracuse in 480. This last city quickly emerged as an international power.

In Campania, where in 524 a major expedition of barbarians aided by

Etruscans of the Adriatic directed against Greek Cumae was successfully repelled (Dion.Hal. *Ant. Rom.* 7.3.1), at the beginning of the sixth century the situation collapsed. An attempt by the Etruscans of Campania, supported by the powerful cities of southern Etruria, to land the definitive blow against the unwelcome presence of Cumae provoked the intervention of Hieron of Syracuse. In the waters off the Greek city in 474, the Greek navy achieved an overwhelming victory over the Etruscan fleet, which was to have immense resonance, being echoed in the poetry of Pindar (*Pyth.* 1.72ff.) and other Greek poets.

The decline of Etruscan Campania thus reached its climax. After not much time it would be completely overrun by the bellicose mountain peoples the Samnites, who in the late fifth century seized the entire city. The leading role of Syracuse was reborn in the middle of the century with the occupation of Elba and Corsica, by the *strategoi* Phayllos and Apelles in 456–455.¹⁶⁶⁹

4From the conflict with Syracuse to Romanization (450–250)

If the loss of mastery of the sea heavily damaged the coastal cities of southern Etruria, the presence of Syracuse in the Tyrrhenian sea seems to have been particularly favorable to the economic take-off of the northern sector, especially Populonia.

The simultaneous collapse of nearby Vetulonia could be the result of simultaneous attacks by Populonia and Rusellae, an operation that may have been encouraged—or in any case looked kindly on—by the new Greek power (Fig. 32.4).

Fig. 32.4: Etruria, 450–250 BCE (Map by L. Pulcinelli)

The turbulence on the Tyrrhenian coast encouraged connections with the cities of inland Etruria and with the Adriatic, via the Po Plain. A new season

of great economic success also smiled on the cities of the Po region—first Felsina and the cities on the sea, especially Spina. Spina now gathers an enormous influx of ceramics and other imported materials brought by seafarers, perhaps originally Aeginetan and then Athenian, who as always, were seeking agricultural produce and livestock, perhaps metals, and probably slaves.

In this period, the intense activity on the Adriatic Sea again met an aggressive attitude from Etruscan seamen, who were also accused of piracy.

In the fifth century and the beginning of the fourth, the north-south flow in the Tiber valley favored the arrival of influence and workforce from Magna Graecia. In the service of the still lively and wealthy ruling classes of inner Etruria, from Falerii, Veii, Volsinii, Chiusi, and Arretium, artists from Magna Graecia left many marks of their passing in monuments that are at times of the highest quality.

In 414, Athens attacked Syracuse and obtained assistance from some Etruscan cities, which intervened with three penteconters (fifty-oared galleys), probably troop transport ships rather than warships, which in 413 carried out an effective military operation (Thuc. 7.53.2).

The Gauls, meanwhile, burst onto the Etruscan Po, traversed Etruria, and in 386 assailed Rome with fire and sword, only to withdraw, permanently occupying the Po Plain and part of the Adriatic coast.

Useful information can be extracted from the aition of the descent of the Gauls to south of the Apennines. The episode of the Chiusine Arruns—who, to avenge a private wrong, invited the Gauls to penetrate Etruria—is eloquent. According to the account, he had captured the interest of the barbarians with the bounty of agricultural resources of the region: figs, honey, wine (Livy 5.33.1–6). This datum, combined with the assertion that the Gauls who appeared on the territory of Chiusi had requested a part of their territory, with the justification that the Chiusines possessed more land than they were cultivating (Livy 5.36), offers us a lively picture of the countryside of the north of Etruria and its economy.

4.1 The fourth century

Between the late fifth and fourth centuries, Etruria found itself facing three great powers. From the north pressed the Celts. From the sea the threat came from Syracuse, because of its policy of encircling the peninsula put into action by the tyrant of Syracuse. (In 384, the resounding plunder of the most important sanctuary of coastal Etruria, at Pyrgi, is recorded.) But another protagonist was advancing from the south. Rome put an end to the age-old confrontation with Veii, conquering it in 396, and began a long series of conflicts with the other cities of Etruria.

According to a sometimes-doubted claim by Livy, already in 388 there had

been Roman action against Tarquinia, with the defeat of the small centers of Cortuosa and Contenebra, in response to Etruscan incursions into Roman territory.

In mid-century, the conflict intensified. Livy (7.12.5ff.) and Diodorus (16.31ff.) recall the Roman-Tarquinian War, which lasted from 358 to 351 and was characterized by episodes of extraordinary brutality (e.g. the massacre of prisoners on each side). This brutality has left traces in the figural tradition, too, in the special fondness for depicting the murder of the Trojan prisoners by Patroclus on so many monuments of the second half of the century (e.g. the François Tomb in Vulci, Sarcophagus of the Priest from Tarquinia, *stamnos* from Falerii, etc.). The war, which ended with the involvement of Caere, concluded with forty-year *indutiae*. After the Gaul episode, Caere benefited from a preferential relationship with Rome, which had granted it the citizenship *sine suffragio*. The crucial final phase of the conflict between Rome and Etruria played out between 311 and 264. The beginning was motivated by an attack by all the Etruscan *populi* except the Arretines, at Sutrium. In 310, the daring crossing of the Selva Ciminia by the army of Q. Fabius Maximus Rullianus ended with a successful raid in the Etruscan territory.

Between the end of the Second (304) and the beginning of the Third (298) Samnite Wars, Rome turned once again to Etruria and Umbria. In 298, there was an expedition against Volterra, led by L. Cornelius Scipio Barbatus. A little later, in 295, came the battle of Sentinum: Q. Fabius and P. Decius Mus overcame a coalition of Etruscans, Samnites, Gauls, and Umbrians; the war took down Chiusi and Perugia as well. Then an expeditionary force in 294 took down Volsinii and Rusellae, the latter conquered by L. Postumius Megellus, who was awarded a triumph.

In 283 came the battle of Lake Vadimone against Boii Gauls and Etruscans; the following year, there were yet more defeats. Finally, a new defeat of the Etruscans is recorded for 280, when the *Fasti triumphales* register the triumph of Ti. Coruncanus *de Vulsiniensibus et Vulcentibus*. The consequences for Vulci were ruinous. In 273, the Latin colony of Cosa was founded with mighty city walls to control the coast. In the same year, a conflict with Caere ended with the defeat of the Etruscan city and the annexation of half its territory. The city was turned into *praefectura*.

The conclusion of the conquest of Etruria is marked by the outcome of the revolt of Volsinii; the consul for the year 264, M. Fulvius Flaccus, received a triumph *de Volsiniensibus*.¹⁶⁷⁰

5 Toward the end (250–89 bce)

5.1 The time of the foedera

After the wars, *foedera* must have been established between Rome and the Etruscan cities, even though the only one attested in the sources is that with Falerii.

One indication of this is provided by the episode of the exile of Cn. Fulvius Flaccus. He had been praetor in 212, when he was severely defeated by Hannibal in Apulia, and in 211 he was exiled to Tarquinia (Livy 26.3.12). The *ius exilii* was contracted only with cities with which there existed *foedera* (*civitates foederatae*). But it is unlikely that this was *afoedus aequum*. Because most of the *foedera* were the result of defeats, it is unreasonable to think that there were not weighty obligations on the Etruscan cities. Because it is unlikely that the cities that had suffered the confiscation of territory (which were to become public fields for the Roman populace) would have had a *foedus aequum*, Vulci and Tarquinia can be excluded from this group. Later, colonies were founded by Rome in the territory of Caere, probably as early as 264 at Castrum Novum, then at Alsium (247) and Fregennae (245); perhaps also Pyrgi was re-founded early in the Second Punic War (Fig. 32.5).

The period between the First and Second Punic Wars did not represent a very difficult time for Etruria. If clear signs of decadence can be glimpsed in the craft works of southern coastal Etruria, northern Etruria seems instead to have enjoyed a period of prosperity. Perhaps also as a result of the phenomenon of diaspora or of displacement of peoples from south to north, we witness a considerable demographic increase in Chiusi, Perugia, and Volterra. Artistic craft works, such as sculpted funerary monuments, urns, and sarcophagi, indicate levels of productivity never achieved previously in numbers or sometimes in quality.

In the inner southern section of Etruria as well, several minor centers show significant well-being in this period; at Norchia and Castel d'Asso there began in the fourth and continued into the following centuries the imposing series of architectural facades carved into the rock. Farther north, Sovana, which in the orbit of Vulci in the late fourth century began the splendid season of its rock-cut necropolises, vigorously flourished after the fall of the city on the Fiora, a sign of which is the many tombs with shrines carved into the cliffs that surround the hills of the city.

5.2 Social upheavals

The history of early republican Rome is strongly marked by the sometimes violent confrontation between the different components of society, between patricians and plebeians. But after 366, after, that is, the promulgation of the Licinio-Sextiae laws (lat. *Leges Liciniae-Sextiae*), which granted access by plebeians to public office, social tensions became less urgent.

Fig. 32.5: Etruria, 250–90 BCE (Map by L. Pulcinelli)

Contrary to the usual view, we can imagine that something similar had taken place in Etruria. The second half of the fourth century saw an

extraordinary proliferation of new *gentes*, who built family hypogea that were used for many generations. It was the mark of admission to the civic body and the ruling class of many new actors. This makes us think of some socially and politically relevant event, like that at Rome mentioned above. The phenomenon took place in much of Etruria, at Caere as at Chiusi, at Tarquinia as at Volterra.

But again in 302, Livy (10.3.2) records a *seditio* of the *plebs* of Arretium against the gentile group of the Cilnii, called *praepotens*. A threatened confrontation was resolved only by the intervention of the Roman consul M. Valerius Maximus Corvus, who managed to reconcile the two factions. In this case, the opponents of the Cilnii were the *plebs*—that is, the entirety of free men.

In other cases, the contrast also involved the lower classes of the city's population. The case of Volsinii is familiar. The social dynamic at the beginning of the third century brought a certain timid opening of the aristocracy, the *domini*, in opposition to the slaves, the *servi*, who seem ultimately to have been freed. Nevertheless, these openings provoked a real hold on power by the ex-slaves, with the consequent estrangement of the city from the old masters or even their reduction to slavery; these people turned to the Roman state for aid. In 264, Roman intervention brought the rapid defeat of the revolutionaries and the deportation of the population to a site farther downstream, on the shore of the Lake of Bolsena. The new city kept the name of the old one, continuing to call itself *Velzna-Volsinii*. Later, Livy notes a *bellum servile* in 196, a real *coniuratio servorum* which affected a large part of Etruria, which was immediately stifled by Rome by means of many executions and restoration of the status quo. The text of the Prophecy of Vegoia, which foresees the possibility that the slaves would move the boundary stones, modifying the order of agricultural property, can perhaps be placed in this equable climate.

The solution of the social conflict with the most disadvantaged classes, however, would have operated differently in the different sectors of Etruria. The famous description of Tiberius Gracchus's trip across Etruria in 135 presents a landscape of the countryside of the southern cities dominated by large estates (*latifundia*), in which no one stirred but slaves, prisoners of war, and barbarians (Plut. *Ti. Gracch.* 8).

In contrast, in the cities of the north—Chiusi and Perugia—the onomastics preserves traces of imposing participation in grants of the rights of citizenship to a large fraction of the population that had been deprived of it, and the granting of citizenship to *servi*. This operation is emphasized in the acquisition of a new onomastic formula that defines the bearer as a citizen with full rights, and must have been accompanied by an equally important participation in agrarian reform, which anticipated the grant of plots of land to these freed slaves. This is shown by the distribution of inscriptions, especially in the territory of Chiusi, where the vast countryside proved in the mid

Hellenistic age to be most very densely occupied by small country properties

Other cities preserved various arrangements. Volterra appears to be a special case, where the territory, though rich in agricultural resources, presents a series of population centers, in which were gathered many family groups, holders of gentilic tombs. The tombs have been opened for the most part at the end of the fourth century, on the basis of which a minor aristocracy can again be inferred.

5.3 The Second Punic War and the Etruscans

Although some sources mention Etruscan *seditiones* following Hannibal's invasion of Italy and his first victories, it is rather unlikely that the phenomenon was very important. This is shown by the extremely short-lived presence of the Carthaginians in Etruria and Umbria; a mark of the disappointing outcome of his hopes of receiving significant aid. Only in 208 did the *sedition* of the Arretine senators happen, which provoked the demand for hostages by Rome. And in any case, two Roman legions were permanently stationed in Etruria, one of them precisely in Arretium, until 200. For this period, Livy speaks of the Etruscans as *socii*, probably those already bound to Rome by *foedera*, even if the equation is not completely verified. Several indications exist of their fidelity to Rome: the *Perusina Cohors*, which in 216 resisted for a long time at Casilinum (Capua; Livy 23.17.11); and the squadron of 180 Etruscan cavalymen, which in 208 fought alongside C. Claudius Marcellus in Apulia (Livy 27.26). The inscription of *Laris Felsnas* at Tarquinia (ETTA 1.107), who had something to do with Hannibal at Casilinum, should also perhaps be interpreted in this sense. In 205, the cities of Etruria contributed to Scipio's expedition (Liv. 28.45.15 ff.).

In any case, a few decades later, the Etruscan territory appears to have been entirely pacified and reliable, so much so that the Etruscan cities seem to be the most suitable place to accommodate the thousand hostages from the Achaean league brought to Italy after the battle of Pidna in 167 (Paus. 7.10.11).

After the conquest, Rome sought to keep Etruria secure with the help of the local aristocracy. At the time of the agrarian laws of Drusus, which were anti-aristocratic, Etruscans and Umbrians descended on Rome to contest them.

Even though a few Etruscans received Roman citizenship before the beginning of the first century, it was only with the *Lex Iulia* of 90 that Etruria also received the new status of citizenship. The *Lex Iulia* came to be applied to those who had not taken up arms or had laid them down early.

The years of the Civil Wars were devastating for Etruria. The participation of many Etruscan cities in the faction of Marius provoked heavy sanctions from Sulla. The case of Volterra is perhaps the best known, because it is cited several times by Cicero. After the siege, the city saw its land confiscated, but

never distributed, if in 45 the orator could still say that Volterra had escaped the hardship of the time of Sulla with the aid of the gods (Cic. *Fam.* 13.4.1).

The final dramatic episode involving Etruria and in a way concluding its troubled history is that connected with the drastic season of the struggles between the factions for achieving supremacy at Rome, specifically that which opposed Octavian and Marc Antony. In 41, Marc's brother Lucius Antonius repaired to Perugia and was entrenched there, well-received by the senate of the city. Forced into open battle, in 40 he was routed by Octavian's troops, whose vengeance fell on the city. Not only the senators were put to death, but many citizens were as well, and the city, albeit unintentionally, was destroyed by fire (App., *B Civ.* 5.49).¹⁶⁷¹

33The transition from village communities to protourban societies

Abstract: In Italy, the research devoted to the origins of the protourban centers in recent decades has clearly evidenced a rapid, profound and very early protourban reorganization began during the tenth century BCE in Etruria, the Veneto and other areas.

The epicenter of this radical transformation—and also the best-studied area—is the southern part of Etruria (nowadays northern Latium). In this area, there is evidence of a very rapid change that happened in the tenth century, at the end of the Final Bronze Age. In the third phase of this period, more than ninety per cent of the preexisting villages disappeared in a short amount of time, at the same time as the formation of four very large (125–175 hectares) protourban centers, occupying plateaus thirty times larger than the average Bronze Age village. In a few generations, these large settlements became the historical Etruscan cities of Veii, Caere, Tarquinia and Vulci. In the interior of southern Etruria, we see the birth of two other large (80 hectare) settlements at the same time: Volsinii (Orvieto) and Bisenzio.

Keywords: protourban centers, Late Bronze Age, Early Iron Age

1Villages and tribes

During the Neolithic era in Europe, the settlement system was based on densely distributed farms and small villages.¹⁶⁷²

This system characterized an entire era of European prehistory, lasting from the sixth millennium until the beginning or—depending on the area—end of the first millennium BCE. This therefore proved to be a very effective system, which had the capability to remain in equilibrium over the course of several millennia.

The very long persistence of the village system is tied to its intrinsic rationality and functionality in the management of the territory, the economy and human relations.

The communities' small sizes allowed for an organization mainly based on horizontal relations founded on kinship, marriage, traditional forms of authority, and maintaining hierarchies at limited levels, like those that brought about the temporary emergence of “Big Men”¹⁶⁷³ or of simple Chiefdoms.

On the economic side, the village system favored an efficient use of the territory in which each community was close to the resources it really needed to exploit and were really necessary for subsistence.

From an archaeological point of view, is not easy to define the political organization of these village communities. However, considering their limited size and their short life span, it is very unlikely that each village was an independent political unit, and so we can postulate the existence of a tribal communal organization.¹⁶⁷⁴ Territorial organizations grouping several village communities, still in existence in Central Europe during the first century BCE/AD, were denominated “pagi” (a smaller unit) or “civitates” (a larger unit) by Romans.¹⁶⁷⁵

During the Neolithic and the Copper Ages, the tribes probably also regulated the frequent shifting of villages. During the (especially advanced) Bronze Age or the Iron Age, when in some regions a more permanent settlement pattern appeared, the villages became stable and more autonomous entities, with solid ties with the territory. In these contexts, the supralocal organization probably became something more similar to a federation, with internal formal rules concerning the right of passage and commerce, the use of resources, common defense, and economic relations.

We can assume that tribes and federations constituted the framework of stability necessary for the economic development during pre- and protohistoric times.¹⁶⁷⁶ In doing so, they acted as a regulating factor, limiting the tendencies of some emerging communities to establish economic and politico-military hegemony. However, this stabilizing role probably made the change difficult, preventing the transition to a different and more complex organization.

The dominance of the village settlement system was interrupted only on very few occasions. In Greece, this happened already during the third millennium BCE, but especially during the second millennium BCE, with the diffusion of the Mycenaean palatial civilization.

The palatial organization arrived in Greece as the final act of the expansionary process of centralized oriental type societies,¹⁶⁷⁷ which originated in Mesopotamia and Egypt. But, after some centuries, the palatial model collapsed in almost all the areas of secondary expansion, receding to the original areas, to which it was well suited, and in which was deeply rooted.

After the great collapse of the twelfth century, most of Greece, Crete and the Aegean rapidly returned to a traditional organization based on small centers and federations.

The cultural sequences of central Italy (Campania, Latium and Etruria) are approximately correlated with Greek-Aegean and Central European phases in Late Bronze and Early Iron Age (**Table 1**).

2The first step of the “Urban Revolution”

The first real and definitive historical breakdown of the village organization happened slightly later in some areas of Greece and Italy. In these areas between the tenth and the eighth centuries, some very large protourban settlements rose, which in a few generations became the leading centers of the urban ancient society (in several cases continuing their urban status until today).

This process in the Greek area is still poorly understood, but it seems to have developed gradually between the ninth and eighth centuries.

Hollow circles: FBA villages abandoned before Early Iron Age (EIA); filled circles: FBA centres survived until EIA (larger circles: protourban centres, 1: Veii, 2: Caere, 3: Tarquinia, 4: Vulci, 5: Bisenzio, 6: Orvieto). (after Pacciarelli 2001)

Fig. 33.2a: Southern Etruria, map of the protourban center of Veii: shaded: settlement area; squares: EIA1 and earlier EIA2 necropoleis (1:50.000). (after Pacciarelli 2001)

In Italy, on the contrary, the research devoted to this topic in the last decades have clearly evidenced a rapid, profound and very early protourban reorganization, which began during (or at the end of) the tenth century in Etruria, Veneto and other areas.

The epicenter of this radical transformation—and also the best-studied area—is the southern part of Etruria (nowadays northern Latium). In this area there is evidence of a very rapid change that happened in the tenth century, at the end of the Final Bronze Age. In the third phase of this period, more than ninety per cent of the preexisting villages (Fig. 33.1) disappeared in a short time, at the same time as the formation of four very large (125–175 hectare) protourban centers, occupying plateaus thirty times larger than the average Bronze Age village. In a few generations, these large settlements became the historical Etruscan cities of Veii, Caere, Tarquinia and Vulci (Fig. 33.2). In the interior of southern Etruria, we see the birth of two other large (80 hectare) settlements at the same time: Volsinii (Orvieto) and Bisenzio.¹⁶⁷⁸

Fig. 33.2b: Southern Etruria, map of the protourban center of Caere. After Pacciarelli 2001: shaded: settlement area; squares: EIA1 and earlier EIA2 necropoleis (1:50.000). (after Pacciarelli 2001)

Fig. 33.2c: Southern Etruria, map of the protourban center of Tarquinia: shaded: settlement areas; squares: EIA1 and earlier EIA2 necropoleis (1:50.000). (after Pacciarelli 2001)

This radical restructuring in the central Mediterranean marks the beginning of the phenomenon called “Urban Revolution” by Vere Gordon Childe.¹⁶⁷⁹ In fact, in the subsequent centuries, the centers of Etruria, together with those of Latium, rapidly elaborated one of most flourishing versions of the Mediterranean urban society, preparing for the rise of Rome.

Recent research shows that other regions had protourban developments as well. This is the case, for instance, of Veneto, where very large settlements arose, sometimes at the end of the Final Bronze Age, as at Oppeano, Villamarzana and Monta-gnana, or during the Early Iron Age, as at Padova, Este, Gazzo and other sites.¹⁶⁸⁰

Fig. 33.2d: Southern Etruria, map of the protourban center of Vulci: shaded: settlement area; squares: EIA1 and earlier EIA2 necropoleis (1:50.000). (after Pacciarelli 2001)

The archaeological research concerning the origins of the protourban centers in Italy has made significant progresses, but there is still a lot to do to understand the historical causes of this phenomenon.

What are the factors that determined this macroscopic historical change? A gradual social and economic development? A radical sociopolitic restructuration? An ethnic process? Or an influence from the eastern Mediterranean?

What we can say is that at this moment, it is difficult to envisage an external input to the protourban reorganization. A migration of a new people—considered as a possibility by some past authors—is to be rejected, because of the evident local cultural continuity between the Late Bronze and the Early Iron Age. A determinant role of Greek or Phoenician trade is unlikely, because there is no real proof of the presence of Greeks in the West before the eighth century, and the traces of a Levantine early activity in Central Italy are inconsistent. A technological revolution determined by iron metallurgy is not

likely, either. In the tenth century, real evidence of ironworking is nearly absent, and in the ninth century, iron is somewhat common only in Calabria.

The only concrete possibility is that of a local process of cumulative changes, that at the end of the Bronze Age caused a radical global restructuring of the old village system, and a shift towards a new protourban organization.

In 1939, Massimo Pallottino wrote “Which necessity [...] moved [the Villanovan communities] to a collective action and to a fully developing culture, in a context where the precedent way of life seemed to have stagnated for centuries in primitive, underdeveloped forms?”.¹⁶⁸¹

The progress of the research in the last decades has profoundly modified this “primitivist” vision of the local Bronze Age societies. Now it is possible to evidence a process of deep transformation of village and tribal systems during the Italian Bronze Age.

3Earlier settlement patterns

It is useful to say some words about the earlier territorial systems that were prevalent during the Copper Age, and in part during the Early Bronze Age.

This early organizational system had a number of peculiarities:

1. Settlements were of a small size, varying from a few dozen to a maximum of 200 or 300 of inhabitants. This datum—not easy to verify positively due to the lack of extensive excavations—may be deduced from the extension of inhabited areas, usually not exceeding one or two hectares.
2. As a rule, villages last only a short time, shown by the general lack of superpositions of several stratigraphic phases. Also, in the best agricultural lands, such as the plain between Rome and the Alban Hills and that around Vesuvius, the settlements frequently shifted from one place to another (although some cases of limited continuity are attested).
3. There is evidence of the prevalent choice of undefended sites, and a frequent absence of artificial fortifications.

These features indicate a society with a low level of territorial stability of the single villages, in which the prevalent level of control and sovereignty may only be that of the tribe or at least of the clan.

It's certainly not a case that in the fourth and third millennia we see in Europe a strong investment in ceremonial monumental centers, and/or in common cemeteries (the latter is especially the case for peninsular Italy). Both of them, often lasting for centuries in the same place, probably were the real foci of territories peopled by shifting communities.

4Territorial and socioeconomic processes during the Bronze Age

While the Early Bronze Age is a transitional phase during which some old traits continue, alongside with the beginning of new trends, from the Middle Bronze Age a marked change in territorial and settlement organization appear in several regions of Italy.

During this period, we see a progressive prevalent choice of naturally defended settlement sites in many areas, and a frequent adoption of artificial defenses, like ditches, fences, earthworks and stone walls.

At the same time, and at a growing rate in the Late Bronze Age, there is a trend towards a selection of settlements,¹⁶⁸² which caused the abandonment of many mainly smaller and less-defended settlements, and the continuity for several centuries of some larger, more strategically located centers.

Between the end of the Middle and the Late Bronze Ages, there is a further trend toward growth in the settlement dimensions, very clear in the Po valley, where some sites reached a relevant size, extending up to fifteen and in one case even twenty hectares.¹⁶⁸³

The long-term stabilization of many settlements in the Middle and Late Bronze Age encouraged investment in land. Clear signs of this process are the irrigation systems found in the *Terramare* area in northern Italy,¹⁶⁸⁴ and the tree crops developed in some areas of southern Italy, where from the Late Bronze Age large pithoi at least in part for olive oil were produced.¹⁶⁸⁵

In this clear process of territorial stabilization and competition, the war indubitably had a relevant role. To the Middle Bronze Age are dated the destruction levels of Roca in Apulia,¹⁶⁸⁶ of Gaggio in the Po valley¹⁶⁸⁷ and of Lipari (and other islands) at the end of Milazzese facies.¹⁶⁸⁸ The Late Bronze Age is the period of other two destructions at Lipari (end of Ausonian I and II) and Roca.

The elites that emerged in the Middle and Late Bronze Age are primarily characterized by the possession of chariots, swords, spears, and defensive armor such as helmets and, later, greaves.

Military activities were oriented not only toward acquiring goods through looting, but also in some cases toward controlling the exchange flows from strategic settlements, such as the coastal and insular ones.

As already noted by Luigi Bernabò Brea¹⁶⁸⁹ this must have been the reason behind complex military actions like the destruction of the villages of Milazzese facies of the Aeolian Islands by the Subapennine Culture groups that occupied the acropolis of Lipari.

The role of trade in the late Bronze Age became increasingly strategic for economic development. By the Late Bronze Age, there had been a great increase in the volume of mining,¹⁶⁹⁰ and trade and exchange related to the production of metallic tools, weapons and ornaments. At the same time, there

was also substantial growth in the production of luxury goods made from amber and glass. This greatly increased trade with central and northern Europe, and the local manufacture of necklace beads.

As a result of this increase in the volume of trade and manufacturing, in the Late Bronze Age, large sites materialized specializing in exchange and craft production, the most famous and relevant of which is obviously Frattesina¹⁶⁹¹ in the Po Plain.

This whole series of socio-economic changes, however, does not result in a general protourban reorganization until the beginning of the first millennium BCE, a sign of a deep-rooted resistance to change of protohistoric social structures.

A process of profound transformation developed only during the tenth century, with some early evidence in Veneto, and a radical and a far greater depth in Etruria.

In Etruria, as almost everywhere in Italy, the organization of the territory during the Bronze Age was characterized by scattered villages, located on defended hilltops and small plateaus. The best-known situation is that of southern Etruria,¹⁶⁹² where there are dozens of villages located mainly on plateaus of between three and ten hectares (only in very few cases up to twenty). The territories, according to the reciprocal distances and to the size of the Thiessen polygons, were normally between ten and thirty square kilometers.¹⁶⁹³

In southern Etruria there was also a certain tendency to form larger settlements, which sometimes extended their territories as a consequence of the abandonment of nearby villages.¹⁶⁹⁴ These monocentric processes, however, appear quite late and were also limited, reaching in only one or two cases a settlement size close to twenty hectares.

5 Origin and development of the protourban communities in Etruria

A further evolution in southern Etruria took place only after a general crisis of the system, which in the final decades of the tenth century, led to the abandonment of ninety percent of the villages inhabited during the Bronze Age (Fig. 33.1).

This process of radical abandonment was likely not without tensions and problems, considering the fact that these village communities—many of which were several centuries old—had a deeply rooted relationship with their territories and resources.

This crisis, however, was not followed by a period of vacuum, as happened in the twelfth century in the southern Po plain, when, after a generalized abandonment of the *Terramare* settlements, the region remained depopulated

for centuries.¹⁶⁹⁵ In the case of southern Etruria, on the contrary, the abandonment was concomitant to a territorial order entirely renewed.

Already in the advanced phase 3 of Final Bronze Age (tenth century), while the territory was still depopulating, there are traces of the formation of some enormous settlements. The largest were four centers not far from the coast, in the sites corresponding to the Etruscan cities of Veii, Caere, Tarquinia and Vulci, which were between 125 and 175 hectares. In the inner areas were Volsinii and Bisenzio, each nearly 80 hectares.

Although at the beginning they were still large agglomerations of protohistoric-type huts, the term *protourban centers* may be appropriate, because in a few generations these large communities developed into a complex and rich civilization, which during the Orientalizing period became fully urban.

In order to understand their genesis, it is important to note that the formation of the protourban communities may not have happened—except in the different case of Bisenzio—through a progressive growth of preexisting centers.

The origin of protourban centres was clearly the result of some sort of planning. Only in those sites, in fact, defended plateaus of that order of magnitude (125–175 hectares) are found, with a number of additional favorable conditions, like the proximity to large concentrations of good arable land and to the sea and/or to a relevant river. This may be explained by the fact that the sites were chosen because they were specifically suitable for very large new centers.

This indicates that the reorganization of the territory took place as a consequence not of a spontaneous and gradual process, but of a specific political project.

In 1969, Renato Peroni stated that “In the whole ‘Villanovan’ area of Etruria, protourban centers emerged [...] while in the surrounding area [...] the Final Bronze Age settlements disappeared. It seems as if new forms of political power have arisen, forcing different tribes and peoples to live together.”¹⁶⁹⁶

Of this new political organization, we perceive two different dimensions—one of single protourban communities, and the other at a macro-regional level.

The earliest internal organization may be defined mainly for Tarquinia, thanks to the numerous excavations of burials, and the discovery of remains of huts at Monte-rozzi and other sites.

5.1 Tarquinia

It is clear that Tarquinia has a very complex topographic organization, which was also connected to a structured social hierarchy. The settlement here developed over two very large plateaus: Civita (composed by three sectors:

The hypothesis that there was a concentration of political and military power as early as the beginning of phase 1 of the Iron Age does not appear incongruous, if compared to the quite uniformitarian range of the majority of Villanovan tombs. On the contrary, it corroborates the hypothesis of an initial polarity between a central power and an undifferentiated mass of warriors.

A new balance of powers, also connected to new military configurations, is probably a widespread phenomenon in Iron Age Italy. In particular, has been suggested that during the Final Bronze Age, the power passed from the hands of a small elite—witnessed by funerary complexes at Castellace and Frattesina that contained swords and other weapons—to a wider social base of warriors armed with spears, and rarely also daggers.¹⁶⁹⁹

The enlargement of the warrior role to the majority of the male population—seen very clearly at Torre Galli—would probably lead to a widening of political and economic rights, possibly including the ownership of land. In more complex situations such as Tarquinia, this would also accompany the formation of a centralized power, in direct relation with the generality of the warriors. This initially seems to have happened without the mediation of clanic structures of the *gens* type, which later reappeared in a more advanced form.

A problem in the visibility of this process in Etruria is tied to the Villanovan cremation ritual, which does not include—except for some very rare exceptions—the deposition of real weapons. The military reorganization is therefore not as evident as in other contexts, especially the Calabrian one of Torre Galli. The tendency to enlarge the role of warrior, however, is otherwise indicated in southern Etruria by the symbolic clay helmets, deposited over the urn in many simple male graves.¹⁷⁰⁰

The other aspect of political reorganization, as stated before, may be seen at a macro-regional level. Beyond the local dynamics, what is really impressive is the concomitant and coordinated formation in Etruria of several protourban centers, which took control of the entire region. The location of these centers (Fig. 33.4) is organized following a precise strategy, organized in two main series: one controlling the internal boundaries and river ways, from Veii to Cortona—with Perugia as a an outpost in the Upper Tiber Valley—and the other close to (or not far from) the Tyrrhenian coast, from Caere to Volterra.

It has to be stressed that the global restructuring of an entire region, through a network of large leading centers, is a type of process that is inherent to the emergence of many ancient states, as evidenced by Colin Renfrew's Early State Module.¹⁷⁰¹

The driving force of this coherent macroscopic reorganization can only be the establishment of a comprehensive system of political and military alliances, which probably also determined further projections (not necessarily colonies) outside Etruria, such as those of Pontecagnano and Sala Consilina in southern Campania (see chapter 73 Cinquantaquattro and Pellegrino), Capua in northern Campania (see chapter 74 Bellelli), Bologna in Emilia (see chapter

75 Malnati), Verucchio in Romagna (see chapter 76 von Eles) and Fermo in the Marche region (see chapter 77 Baldelli).

Fig. 33.4: Etruria and Latium Vetus, main EIA centers. A: 100–200 ha; B: 50–100 ha; C: 20–50 ha; D: 1–15 ha. 1: Anzio; 2: Satricum; 3: L’Altare; 4: Ardea; 5: Lavinium; 6: Decima; 7: Ficana; 8: Acqua Acetosa Laurentina; 9: Rome; 10: Antemnae; 11: La Rustica; 12: Tuscolo; 13: Lanuvio; 14: Velletri; 15: Caprificio; 16: Palestrina; 17: Gabii; 18: Corcolle; 19: Tivoli; 20: Fidene; 21: Crustumerium; 22: Veii; 23: Caere; 24: Tarquinia; 25: Vulci; 26: Vetulonia; 27: Populonia; 28: Volterra; 29: Fiesole; 30: Cortona; 31: Perugia; 32: Chiusi; 33: Orvieto; 34: Bisenzio; 35: Ocriculum; 36: Poggio Sommavilla; 37: Campo del Pozzo; 38: Cures. (after Pacciarelli 2001)

As an integral part of this great political process, the construction of new common cultural forms must also be considered. I allude to the so-called “Villanovan” symbolic, ritual and stylistic code,¹⁷⁰² which has its maximum

coherence in Tarquinia, which in many ways—even in Etruscan legends—appears as the leading center of the protourban project.

The existence of precise models in Villanovan culture is particularly evident in the urns of Tarquinian necropolises, characterized by very high standardization in form and decoration.¹⁷⁰³ The “canonic” model of urn is adopted in more than ninety percent of the tombs of the first Villanovan phase. This rigor is quite attenuated outside Tarquinia, but the main frame of reference appears the same.

The high symbolic meaning of the funerary rituals in the Early Iron Age is also indicated by the simultaneous development in nearby areas of ritual systems clearly and consciously opposed to the Villanovan.¹⁷⁰⁴ Distinctly different is the system of Latium Vetus, which developed in Latin centers east of the Tiber, including Rome and Gabii.

But just as different, and very similar to the Latin, is the ritual code developed at Bisenzio,¹⁷⁰⁵ which appears as a dissident center, consciously excluding itself from Villanovan symbols, identity, and perhaps organizational framework.¹⁷⁰⁶ In this respect, it is no coincidence that the settlement of Bisenzio was located not on a specifically chosen plateau, but in a nearly flat area around a preexisting hilltop village, as if it was a spontaneous alternative form of aggregation. Despite its considerable size—much larger than Vetulonia for instance—it is significant that Bisenzio never became part of the Etruscan twelve cities league, the *dodecapolis*.

7Conclusion

The new coherent and coordinated political and cultural framework of Villanovan Etruria is to be perceived as a decisive propulsive factor of economy, as a precondition for the free flow of goods, people and knowledge. A will to take total control of the exchange flows is indicated by the location of the protourban centers, chosen for their defensibility but also for their proximity to the main lines of communication.

In this regard, we have to consider that the protourban centers, as large concentrations of people located in strategic nodes of exchange, also acted as large markets, amplifying the economic opportunities.

The great economic potential of these centers, starting in the earliest stages, is also shown by the massive exploitation of marine resources—in particular salt—by the centers located close to the Tyrrhenian Sea, indicated by the remarkable proliferation of industrial sites characterized by huge numbers of jars.¹⁷⁰⁷

In fact, the Early Iron Age in Etruria opens a phase of high economic development, resulting in a continuous increase in the availability of goods and in the diffusion of a new aristocratic lifestyle,¹⁷⁰⁸ as shown by the

funerary contexts, a process very evident at least from the beginning of phase 2 at Veii.

The consolidation of the “Etruria system,” with its external connections, clearly stimulated a relevant economic growth in several adjacent regions, already during the Iron Age.

In this process of extraordinary economic growth, Levantine and Greek sailors were attracted during the eighth century. These new partners, especially after the founding of the first colonies, contributed to activate a continuous flow of goods, people and informations across the entire Mediterranean, which gave way to the economic takeoff of the Archaic period, and ultimately started the urbanization of the ancient Mediterranean world.

34The diffusion of Near Eastern cultures

Abstract: This chapter will analyze the relationship between the Near Eastern and Etrurian civilizations from the collapse of the Mycenaean palaces to the Orientalizing period. This discussion claims that relationships continued between the eastern and western Mediterranean, which were not interrupted with the dissolution of the Mycenaean civilization and the invasion of the so-called Sea Peoples, but continued thanks to the initiatives of “merchant-adventurers” whose main meeting place was on Cyprus. Between the twelfth and tenth centuries BCE, Cyprus played an important role for traders with the West, who traced the routes that had already been beaten by Mycenaean vessels and who kept contacts alive with the indigenous Sicilian and Sardinian communities. From the end of the tenth century, we witness a gradual increase in sea traffic from the city of Tyre, which, with the collaboration of Cypriot elements, created a dense network of ports in the Aegean and west-central Mediterranean. The driving force of these initiatives lay in Tyre’s monarchy and its relationships with the merchants who were active along the Levantine, Cypriot and Aegean coasts. The focus of these merchants’ interests is seen in the search for and acquisition of raw materials, especially metals. Already in the ninth century, Tyrian officials and merchants were active in the main mining districts of the West—from Calabria to Sardinia, and from northern Etruria to Atlantic Andalusia. In the Italian peninsula, the first finds that attest a Cypriot/Phoenician presence are from Torre Galli, on the Tyrrhenian coast of Calabria. At the same time, the ports in southern Sardinia were enlarged and became the focus of direct routes to the Etruscan-Lazio and Iberian coasts. During their first trading activities in the western Mediterranean, Phoenician sailors came in contact with Greeks. Phoenician and Euboean merchants actively collaborated in Cyprus, al-Mina and in the main ports of the Levantine and Aegean coasts. The collaboration between these two groups also proved successful in the West, as demonstrated by the evidence from Pithekoussai on Ischia, which was frequented by Phoenician merchants and artisans. From here and from Sardinia, through a trading network that ended along the Levantine coast, Phoenicians and Euboeans established relationships with the Latin and Etruscan communities. Such contacts intensified between the end of the eighth century and the first half of the seventh with the transfer of Eastern workers to Italy who satisfied not only the local elites’ tastes, but also transferred knowledge of goldworking, metallurgy, glass and ivory working. Within a short time, the Eastern know-how spread from the “princely” dwellings to the higher classes, becoming the collective heritage of the Mid-Tyrrhenian communities.

Keywords: Orientalizing period, Mediterranean trade, Italian peninsula, Phoenicians, Etruscans

1Between East and West: the Mediterranean after the collapse of the Mycenaean civilization

This chapter is intended to affirm the continuity of relationships between the eastern and western Mediterranean, even after the collapse of the Mycenaean civilization and the destruction wrought in the Aegean and along the Levantine coast by the so-called Sea Peoples. In fact, during the twelfth century BCE, contacts continued thanks to the initiatives of independent merchants, who were not directly incorporated into the rigid Palatine system, and whose main meeting center was in Cyprus.¹⁷⁰⁹ Compared to those of the past, the new protagonists are more difficult to identify both from a social and ethnic point of view. The multifaceted nature of these “Merchant-adventurers”, who gave birth to a heterogeneous and multiethnic movement, was also reflected in the types of products that reached the West and which often resist a precise classification.¹⁷¹⁰ However, the resourcefulness of these new protagonists meant that the relationships between the two shores of the Mediterranean were not loosened. Some modern scholars claim that they were instrumental in the arrival of the numerous Eastern goods that have been defined “pre-colonial” in the central-west Mediterranean.¹⁷¹¹

As noted, the politico-economic engine of this movement towards the West must be identified in the Cypriot *chiefdoms*. It is apparent in the dense network of relationships that existed between the indigenous populations of Sicily¹⁷¹² and Sardinia, and is archaeologically documented mainly in metallurgy and metal-technology. In Sardinia, the spread of Cypriot bronze artifacts destined for indigenous elites was so pervasive that the island became a primary center of diffusion of sumptuary goods and working techniques originating in the eastern Mediterranean.¹⁷¹³ Many of the Cypriot or Cypriot-inspired products found in central Italy in early first millennium contexts seem to have come from this island, following the close relationships initiated by the Nuragic aristocracy with similar continental entities. For some scholars, moreover, the strong alliance between prominent groups from Villanovan centers and the large Nuragic complexes of northern Sardinia favored the introduction of Cypriot-Phoenician trading on the Etrusco-Lazio coast.¹⁷¹⁴

There is currently a lively debate among scholars concerning the nature and duration of the contacts that spread throughout the central Mediterranean basin from Cyprus.¹⁷¹⁵ Many specialists demonstrate that such relationships flourished between the twelfth century and the beginning of the eleventh. The end of the second millennium represented a fracturous moment in relationships between the eastern and western Mediterranean, the stable recovery of which would restart only from the mid ninth century.¹⁷¹⁶ Consequently, a lot of Cypriot and Cypriot-inspired material found in the West in contexts assignable to the early first millennium could be interpreted as residual elements of a season of contact firmly framed in the previous millennium. Such a hypothesis contrasts with the opinion of those who see continuous movement of Cypriot material towards the West in the second and first millennia.¹⁷¹⁷ Indeed the violent destructions that signal the end of the

Mycenaean power in Greece must have favored the development of areas that were peripheral to this “empire,” which, as in the case of Cyprus, saw a consistent flow of migration from the continent.¹⁷¹⁸ Thus, far from entering a period of recession, at the end of the second millennium, the “copper island” continued to be the principle center of production of this metal, and at the same time became the focal point of the transmission of innovative techniques linked to ironwork.¹⁷¹⁹

This favorable situation resulted in the birth of Cypriot kingdoms that over time became an essential reference point for Levantine mercantile initiatives towards the West. In this “fluid scenario,”¹⁷²⁰ where different ethnic groups competed to keep the dense networks of relationships with the west-central Mediterranean basin alive, the Phoenician component took on a major role from the tenth century. From this moment, moreover, there was a close collaboration between Cypriot elements and Phoenician merchants, who found their maximum archaeological visibility in the Aegean, but also later, in the West.

2Between Tyre and Euboea: trade in the eastern Mediterranean from the tenth to the eighth centuries

At the start of the first millennium, eastern Mediterranean traffic accelerated due to a set of favorable situations that can be summarized in the strong economic dynamism of the Greek world, especially in its Euboean component and in the sudden politico-economic growth of the city-state of Tyre.¹⁷²¹

From the tenth century, there are indications of direct relationships between Lef-kandi and Tyre.¹⁷²² In this phase we witness an influx of precious objects into Greece, such as gold ornaments, bronze vases, Egyptian style *faïence* and ivory artifacts from Cyprus and the various regions of the Near East. The Greek exports into the Phoenician metropolis mainly relate to ceramics that gradually reached the inland areas of the Syrian-Palestine region.¹⁷²³ This is a parallel initiative that makes use of the intermediation of Cyprus, the main area of contact between Phoenician and Euboean elements. The Euboean pottery found at Amathus, in the southwestern sector of the island, highlights the route followed by the Greek navigators to reach the Phoenician coast and the thriving port of Tyre (Fig. 34.1).¹⁷²⁴

Later, the contacts increased and affected various sites on the Levantine coast, from Tell Sukas to Tabbat el-Hammam, and Ras el-Bassit to al-Mina.¹⁷²⁵ This last center can help us better understand the nature and means of the contacts that were developing in this phase. During the first half of the eighth century, a large emporium was built at the mouth of the Orontes River through the joint initiative of Greek, Phoenician and Cypriot merchants. This

depended on the Luwian monarchy, which ruled the state of Unqi-Patina and resided in the capital Kunulua (Tell Tayinat).¹⁷²⁶ The emergence of al-Mina is therefore the result of stable and reciprocal associations between Euboean, Cypriot and Levantine peoples, but also the start of a new intercultural process facilitated by the intensification of direct relationships and the strong economic-cultural dynamism of the Syrian kingdoms.

3From al-Mina to Pithekoussai: the structuring of international trade in the Mediterranean

The importance of al-Mina in Mediterranean trade can be grasped by enlarging our study area to the West. In the same years that the emporium was founded at the mouth of the Orontes, the Euboean cities felt the need to consolidate their presence in Tyrrhenian area, giving rise to the establishment of Pithekoussa i on the island of Ischia. From its earliest stages, this center acted as a catalyst for international trade, encouraging relationships with the communities of Latium vetus and Etruria. Specialists are still discussing the possible presence of a nucleus of Levantine merchants and artisans at the site.¹⁷²⁷ Beyond the fact that “Eastern” communities were able to live on Ischia, there is no doubt that the Euboean settlement was able to attract the interest of the central Mediterranean colonial Phoenician settlements due to its strategic position on the routes that led from the Straits of Messina to the mid-Tyrrhenian coast of the Italian peninsula and Sardinia.¹⁷²⁸ At the same time, judging by the archaeological data, contacts with the diverse realities of the Near East are indisputable.¹⁷²⁹ In agreement with Bruno d’Agostino,¹⁷³⁰ it is likely, therefore, that the establishment of Pithek-oussai immediately preceded colonization. It is the daughter of that happy season of discoveries by sea, whose strength was found in the collaboration between Greeks, Levantines and Cypriots and the trading of goods, and its purpose in the sharing of knowledge. As d’Agostino notes, “Pithekoussai fits into this world of movement as an organizing element, destined to catalyze the exchanges between the East and West, at least concerning the Etruscans of Campania and Etruria itself.”¹⁷³¹ For this reason, the settlement played a central role in the formation of an Orientalizing culture on the Italian peninsula even if the dynamics of this complex phenomenon must be evaluated in the long term and are the result of contacts that started a long time earlier.¹⁷³²

4The first contact in southern Italy: from Torre Galli to Pontecagnano

Non-interrupted contacts between the eastern and western Mediterranean intensified during the ninth century with the opening of the port of Kommos, in south-central Crete, to Cypriot-Phoenician ships.¹⁷³³ The first relationships between people from the eastern Mediterranean and Italian communities can be traced to this period. The indigenous center that has the oldest traces of these visits is Torre Galli near Tropea (Fig. 80.1). Marco Pacciarelli's recent re-examination of the material from Paolo Orsi's early twentieth-century excavations has demonstrated a Cypriot-Phoenician presence in the area that Pacciarelli has dated to between the end of the tenth century and the beginning of the ninth, raising the traditional dating by about fifty years.¹⁷³⁴

Fig. 34.1: Map of Cyprus and Ancient Near East

Type 1	dia./h < 2.5	Hemispherical or almost perfectly hemispherical basin	Mercuri 2b	
Type 2	dia./h < 2.5	Basin tendentially conical, doesn't qualify as a hemisphere due to a change in pitch in the lower part	Mercuri 2a	
Type 3	dia./h = 2	Globular basin with max. diam. just under the rim	Mercuri 3	
Type 4	dia./h 2.5 – 3.5	Compressed basin	Mercuri 1b	
Type 5	dia./h > 3.5	Flattened basin	Mercuri 1a	
Subtypes: a) thickened rim b) separate rim c) small <i>omphalos</i> in centre d) small flat base Decorations: a) Inscription b) Groove under rim γ) Row of incised scales				

Fig. 34.2: Torre Galli: typology of the Phoenician metallic cups (from Sciacca 2010)

Imports to Torre Galli offer some food for thought. Many of the artisan categories that were widespread in the Orientalizing period are documented there, from *aegyptiaca* to beads and glass paste pendants and *faïence* used to adorn rich women’s clothing,¹⁷³⁵ from ivory to artifacts for ceremonial use, such as bronze cups (Fig. 34.2). It has been established that the latter were produced in a Levantine or Cypriot environment.¹⁷³⁶ Furthermore, the exclusive presence of this artifact in female tombs has been connected to rituals of libation where women played an important role.¹⁷³⁷

The interests of the Greek and Eastern merchants would soon spread throughout Campania, the southern Italian region that would be the real bridgehead for traffic with the rich and potent communities at Latium vetus and in Etruria. Unfortunately, as recently underlined by Bruno d’Agostino,¹⁷³⁸ the importance of the unpublished material for such major centers as Cumae, Capua and Pontecagnano risks making a statistical evaluation based on the published material quite unreliable. However, the importance of such a region for the eastern Mediterranean sailors from the end of the ninth-beginning of the eighth century clearly emerges from the exhaustive analysis carried out on pre-Roman *aegyptiaca*.¹⁷³⁹ The relationships with Greece and the Near East started to intensify from 800, following acceleration in the growth of the local communities. This phenomenon is clearly visible at Pontecagnano, the large Villano-van settlement in the Picentino plain, where the most significant quantity of Greek and Greek type ceramics from the whole region has come from.¹⁷⁴⁰ The opening up to an Euboean component and to the Phoenician market fits into an interregional framework, which was already well-

organized during the ninth century, opening to the Tyrrhenian coast of Calabria and Sicily on one side and Etruria and Sardinia on the other.¹⁷⁴¹ The organization of the exchanges can be understood by the analysis of the grave goods, with wealthy parts that demonstrate the emergence of high-ranking people.

As has been authoritatively argued, Pontecagnano is just one piece in a complex and articulated picture¹⁷⁴² that recent research helps make more understandable. The investigations carried out at Montevetrano are very interesting, as they demonstrate the key role of Campania in the connection between the eastern Mediterranean and the communities of mid-Tyrrhenian Italy.¹⁷⁴³ Only starting from these assumptions is it possible to understand why the Euboeans decided to found a *comptoir* on Ischia in the second quarter of the eighth century, and a colony at Cumae on the mainland immediately afterwards.¹⁷⁴⁴

5 Towards the Far West: men, routes, goods

From a chronological point of view, the documentation from Torre Galli demonstrates the contact by Cypriot-Phoenician sailors with the Calabrian coast in a period that ranges from the end of the tenth century to the middle of the ninth, according to the different interpretations.¹⁷⁴⁵ The oldest materials from the historical center of Huelva are dated to roughly the same time.¹⁷⁴⁶ The material recovered in Calle Méndez Núñez is of great interest not just for its high chronology, but also for its variety. In fact, a consistent core of local and Phoenician material has been found alongside more limited amounts of Greek, Cypriot, Sardinian, and “Villanovan” pottery.

Fig. 34.3: Main routes from the homeland to the regions targeted by the Phoenician

For the first vessels that reached the Atlantic Andalusia, we find a situation that reflects the findings from east-central Mediterranean trade, with collaboration between Levantine, Greek and Cypriot merchants. Once again, the engine of these initiatives is the search for new markets and the acquisition of raw materials—especially metal. Huelva represents the ideal welding point between Atlantic and Mediterranean trade, due to its safe port and its strategic position as the end of the rich mineral districts of Riotinto.¹⁷⁴⁷

The discovery of western markets by the ships from the eastern Mediterranean was facilitated by the collaboration with the local—and in particular Nuragic—sailors.¹⁷⁴⁸ Thanks to them, the Phoenicians could reach both the rich markets of Etruscan Lazio and those of the Atlantic Andalusia. In this regard, two areas of Sardinia were particularly important—those of the Gulf of Cagliari and its surrounding areas,¹⁷⁴⁹ and the Nurra.

Fig. 34.4: Bronze decorated cup from Tomb 7 of the “primo circolo di pietre interrotte” from the Poggio alla Guardia necropolis, Vetulonia (from Maggiani 1973)

The Gulf of Cagliari was the start of two routes to the West that was furrowed by Eastern ships whose mixed crews most likely benefitted from the expertise acquired over time from local sailors.¹⁷⁵⁰ The first route ran along the western coast of Sardinia before turning east in the direction of northern Lazio, or climbed along the eastern coast of Corsica before joining with the second route (Fig. 34.3). The second route was used by Sardinian and Eastern sailors to reach Spain, via the Balearic Islands, and northern Etruria (Fig. 34.3).

Focusing on the latter destination, the Nuragic settlement of Sant’Imbenia,

north of Alghero, is of considerable importance. From the end of the ninth century, it was home to a group of Levantine merchants and artisans.¹⁷⁵¹ Concerning the relationship with the Italian peninsula, Sant'Imbenia was an important port where the Phoenician ships could stock up before facing the difficult crossing of the Strait of Bonifacio. After crossing the strait, the ships had to sail along Corsica's eastern coast before heading east towards the Tuscan archipelago. This was the ideal bridgehead with the centers of Populonia and Vetulonia, used first by Nuragic then Levantine merchants.¹⁷⁵² The Phoenician presence in this area is signaled by the splendid ornamented cup (Fig. 34.4) from a pit tomb from the necropolis of Poggio alla Guardia (Vetulonia), dated between 750 and 720.¹⁷⁵³

6 Interactions and cultural contacts in the mid-Tyrrhenian area between the formative phase and the beginning of the Orientalizing period: the Sardinian guide

The proposed historical framework underlines the plurality of contacts that from the western Mediterranean at the start of the first millennium involve the mid-Tyrrhenian area of the Italian peninsula. In such a system of relationships, Sardinia played a key role by fostering the arrival in central Italy of the artistic-artisan experiences developed there, and promoting the exportation of western Mediterranean techniques and products. In this flow of relations, furthermore, the early and exclusive relationships between the Nuragic and peninsula elites were progressively enriched by new Levantine protagonists.

One class of material that exemplifies this situation is that of the bronze tripod stand, which was most likely used for burning aromatic substances during public ceremonies, whose introduction into the West is closely connected to the thriving season of Cypriot-Mycenaean trade.¹⁷⁵⁴ The development of these artifacts in the Sardinian environment is certain, and continues well after the end of the second millennium with completely original results.¹⁷⁵⁵ For example, miniaturist creations with strong symbolic and sacred meanings form part of the "aristocratic" circuit of exchanges with the Etruscan population, as in the example from tomb 10 at the Romagnoli necropolis at Bologna, where the grave goods are dated to the beginning of the seventh century.¹⁷⁵⁶

Fig. 34.5: Bronze decorated *phiale* from the S(trada) tomb of the Macchiabate necropolis, at Francavilla Marittima (from Zancani Montuoro 1970–1971)

The cult-wagons also belong to this category of luxury goods. From the Piediluco-Contigliano (Terni) hoard,¹⁷⁵⁷ generally dated to around 900, a wheel survives.¹⁷⁵⁸ The spread of such artifacts in the Italian Tyrrhenian area must have been much greater than can now be seen from the meager archaeological evidence. In fact, a complex work such as the noted bronze wagon from tomb 2 from the Olmo Bello necropolis at Bisenzio,¹⁷⁵⁹ dated to the third quarter of the eighth century (Fig. 10.1), would be incomprehensible without the comparison with the Cypriot prototypes in vogue in the Bronze Age, or with their faithful reproductions from the Nuragic period during the early centuries of the first millennium.

Fig. 34.6: Bronze cup with handle with globular appendices from tomb 132, Castel di Decima (from Bedini, Cordano 1975)

Another type of object that demonstrates the key role that the Nuragic culture played in their relationships between the eastern Mediterranean and the communities in mid-Tyrrhenian Italy is that of the cups forged with a single handle with globular appendices. The finds are concentrated in central Italy, with the exception of the Francavilla Marittima phiale (Fig. 34.5). It is highly likely that the handle of the cup in question was originally part of a cup made in central Italy and only added to the Francavilla *phiale* after an ancient restoration.¹⁷⁶⁰ The remaining finds concern the example found at Castel di Decima (Fig. 34.6) in a female tomb dated to the first quarter of the eighth century,¹⁷⁶¹ to which three other finds can be added, also in female tombs, from Bologna,¹⁷⁶² Populonia¹⁷⁶³ and Veii¹⁷⁶⁴ (Fig. 34.7). Adriano Maggiani has recently suggested placing a handle from the Antiquarium of the Florence Archaeological museum into the series; this is unprovenanced but hypothetically attributed by the scholar to Vetulonia.¹⁷⁶⁵

Fig. 34.7: Bronze cup with handle with globular appendices from tomb 1032 in the Casale del Fosso necropolis, Veii (from Drago Troccoli 2009)

The debate on the attribution of these artifacts is ongoing. Returning briefly to the discussion of this typology of cups, Gilda Bartoloni's observations are fundamental.¹⁷⁶⁶ She has discerned a close relationship between the handle with globules from some metal vessels found in Italy with the globular terminations on some Nuragic bronzes and some types of Sardinian handles. Later studies¹⁷⁶⁷ have highlighted the weak links with the Levantine and Cypriot artistic/craft productions, and have shown the impossibility of identifying precise reference models, as their manufacture in the West are probably fruit of numerous and stratified influences, which reached Sardinia from the eastern Mediterranean in the early centuries of the first millennium.¹⁷⁶⁸

Fig. 34.8: Bronze carinated cauldron with pair of double spiral handle attachments, from Tel Jatt hoard, near Megiddo (from Artzy 2006)

It is therefore likely that the cups in question arrived in Italy thanks to the agency of Nuragic elements and Phoenician sailors, even if it is impossible to exclude the possibility that they were copies made *in loco* by itinerant craftsmen.¹⁷⁶⁹ A final consideration concerns the presence of these cups in exclusively female prestigious tombs. If the appendages of the handle can be interpreted as plant motifs—and can therefore be traced to the annual cycle of nature¹⁷⁷⁰—it seems plausible to associate these vases with fertility and procreation rites connected with the continuation of the lineage within the groups that were emerging in the Italian Iron Age.

Large bronze recipients can be found within the flow of contacts between Sardinia and central Italy. According to their typologies these were used for boiling meat, libations or ritual ablutions. The carinated cauldrons with spiral handle attachments¹⁷⁷¹ are likely to have been manufactured in the Levant, due to the discovery of the Tel Jatt hoard, near Megiddo, which has an example with such characteristics (Fig. 34.8).¹⁷⁷² The Tel Jatt cauldron is very similar to the shape of the bowl and the type of handle attachment from a Nuragic example in Cala Gonone (Dorgali, Nuoro),¹⁷⁷³ which, by no accident, is near one of the safest harbors on the east of the island. The relationship this settlement had with the sea, ready to receive but also to export precious

artifacts, might be confirmed by a similar recipient, probably from the same workshop, from the S. Francesco hoard in Bologna, where it had been totally crushed and used as scrap metal.¹⁷⁷⁴

Fig. 34.9: Deep bronze basin with lotus flower handle terminations, from Santa Anastasia, Sardara (from Matthäus 2001)

Another type of bronze is that of the cauldrons decorated with lotus flower handles fused at the base on a plate that has the characteristic form of a double lobed circle. This type¹⁷⁷⁵ reached its maximum extent in Cyprus during the Cyprus Geometric I—II (1050–850), but it is probable that these cauldrons continued to be made in the CG III (850–750), as the many finds made away from the island show a proliferation of local schools from much later phases.

The discovery of a basin with lotus flower terminations in the Tel Jatt hoard, in Galilee,¹⁷⁷⁶ allows the production of this type of bronze to be related to Phoenician craftsman. The data is confirmed by the exceptional discovery in the “meeting hut” near the Nuragic sacred well temple at Santa Anastasia in Sardara, on Sardinia. A hoard was found in this building — dated by the context of the excavation to the second half/end of the eighth century,¹⁷⁷⁷ — which contained three bronze basins stacked one within the other. These comprise two recipients with lotus flower terminations, one with a deep bowl (Fig. 34.9) and the other with a shallower bowl and a situla with a “bridge” swing handle and spiral attachments. Concerning the basins, the one with the shallow basin has “wolf’s tooth” decoration inside (Fig. 34.10), typical of the Phoenician figurative repertoire.¹⁷⁷⁸ For this reason, it is plausible to date the decorated basin from Sardara to the eighth century and to attribute it to a Phoenician *atelier* from the homeland. For the other two bronzes, however, an older chronology cannot be excluded, as the structure was in use between the ninth and eighth centuries.

Fig. 34.10: Shallow bronze basin with lotus flower handle terminations, from Santa Anastasia, Sardara (from Matthäus 2001)

Imports of this type from the eastern Mediterranean are also present on the Italian peninsula. For example, the handle found in the Polledrara di Vulci necropolis and the basin found in chamber tomb 2 in the F tumulus at Satricum,¹⁷⁷⁹ which is similar to the deep basin from Sardara. The tomb, which contains other deposits, is dated to between the beginning of the seventh century and 620–610 on the basis of the imported pottery.¹⁷⁸⁰ The basin was associated with the most recent burial and is therefore much later than the *floruit* of Cypriot productions. Nevertheless, the Lazio example is surprisingly similar to these last examples and presents technical features such as the double loop handle that implies a direct knowledge of the prototypes. For this reason, the basin from Satricum is likely an import, just like the

Sardinian ones.¹⁷⁸¹ The view expressed here seems further confirmed by the examination of the Orientalizing re-elaborations of the lotus flower handles, present in large numbers on the Italian peninsula from Campania to northern Etruria, that have particular finishes and are often very far from the Cypriot prototypes.¹⁷⁸²

The artifacts under consideration represent only a selection of the numerous materials that passed from Sardinia to the Italian peninsula in the early centuries of the first millennium. However, they are illustrative of the forms of contact that took place in this period, based on the practice of gift exchange and directed mainly to the transfer of metalworking technologies. It is by no accident that the contacts took place with the centers of Populonia and Vetulonia, which controlled the rich metalliferous districts of northern Etruria. A last consideration concerns the eastern influxes that we can identify in the series of objects analyzed. These fit perfectly into a Cypriot-Phoenician cultural matrix which, as can clearly be seen on the basins with lotus flower terminations, continued to have an important role after the start of colonization in the West and the beginning of the Orientalizing period.

7The reception centers in Etruria: Tarquinia and Veii

Tarquinia played a key role in the opening up of trade with Euboean and Phoenician sailors. *Athyrmata* and jewelry in precious metals have been found at Tarquinia, which demonstrate the contacts with Levantine merchants.¹⁷⁸³ Moreover, in Tarquinia, the “Greek”¹⁷⁸⁴ way of drinking was introduced early on, even before the arrival of the Euboean *skyphoi*, as shown by the presence of craterform vases in funerary deposits of the mid/late (phase IB-IC: last decades of the ninth century) and late (phase IIA: 780–760) Villanovan period whose distinctive style, with no local antecedents, seems to be freely marked by Hellenic models.¹⁷⁸⁵

Another strategic point for the first contact between Levantine and Euboean elements and the mid-Tyrrhenian communities is represented by the mouth of the Tiber. The control of the river was one of the primary objectives of Veii from the end of the ninth century.¹⁷⁸⁶ The mouth of the river had vital importance for Veii, which could enter Lazio directly through the river valleys of the Galeria and Cremera—independently of Rome—and reach the coast, thus making the connections with Greek and Eastern merchants easier.¹⁷⁸⁷

Between the end of the ninth century and the middle of the eighth, a series of products from the Nile and Levantine areas arrived at Veii, which confirm the first contact with Eastern *prospectors*. These products are Egyptian and Egyptian-style scarabs and statues in *faïence* or jewelry and decorative elements for clothes and headdresses made in glass paste, *faïence*, amber,

quartz and rock crystal.¹⁷⁸⁸ Their spread through the Mediterranean in the early centuries of the first millennium is mainly due to the activity of Phoenician merchants; it has often been pointed out that these artifacts are present in important funerary contexts in association with prestige objects made in the Near East.¹⁷⁸⁹

For Veii, such a line of research has produced very interesting results for tomb 817 at Casale del Fosso, the date of which is thought to be at the start of the local phase IIB, i.e. around the mid eighth century. Among the rich objects, from the grave of a young woman, came eastern *athrymata* and a miniature bronze, Nuragic made, *olla*.¹⁷⁹⁰ This association between eastern and Nuragic material confirms that the wide range of Nuragic objects that arrived on the Italian peninsula at the beginning of the first millennium were the result of understandings reached between Sardinian and Phoenician sailors.¹⁷⁹¹

Confirming the plurality of contacts maintained by Veii in this phase, in tomb 817 at the Casale del Fosso there is an exceptionally interesting find—a boot shaped vase—which demonstrates that the family of the Veiiian woman was in direct contact with northern Etruria, a privileged area of contact with the Sardinian communities attracted by the huge mineral resources of the *Colline Metallifere*.¹⁷⁹² The abovementioned cup with handles terminating in globules from tomb 1032 at Casale del Fosso and almost contemporary with burial 817, points us to these guides.¹⁷⁹³

8The Orientalizing period

Imports from the eastern Mediterranean increased further at the start of the ancient Orientalizing period (730–675). The driving force of these contacts made by the Greeks and Levantines has been identified in the diffusion of the symposium model among Italian elites.¹⁷⁹⁴ As we can see, the introduction of practices linked to ceremonial consumption of wine in central Italy had a long gestation period starting in the ninth century. In this period, there was a complex interweaving of Greek and Eastern contributions that makes it difficult and sometimes impossible to distinguish the original vectors. From the last decades of the eighth century, the symposium practice reached its widest diffusion in the Italian peninsula following the consolidation of the indigenous aristocracy and their desire for self-celebration. At the same time, there was an increase in the export of wine from the colonial centers.¹⁷⁹⁵ Within a few decades, the Phoenician wine produced in the West together with sophisticated sets in precious metals imported from Cyprus and from the various regions of the Near East spread out through the communities of Latium vetus and Etruria to celebrate the splendor of the powerful aristocratic families.¹⁷⁹⁶

A second factor that must be analyzed concerns the presence of an ever-growing number of Near Eastern artists in the communities of Italian peninsula, who contributed to the birth and affirmation of the Orientalizing style.¹⁷⁹⁷ At the start, the phenomena mainly concerned goldworking, with the creation of personal ornaments that have elaborate decorations in granulation and filigree.¹⁷⁹⁸ Only with the start of the seventh century do the discoveries become more consistent and cover a number of sectors, from statuary to architecture, from metallurgy to the working of ivory and glass.¹⁷⁹⁹ In this variegated panorama, artistic experiences and classes of artifacts from not only Phoenicia and Cyprus but also different areas of the Near East and Anatolia mix together. Phoenician merchants and entrepreneurs worked closely with Euboean and Cypriot sailors. From al-Mina and the ports of the Gulf of Alexandretta, goods from the neo-Hittite and Aramaic kingdoms arrived on the Italian Peninsula on Greek and Phoenician ships, expanding the range of artistic influences from the East in the courts of the Italian aristocracy.

Under the reigns of Tiglath-Pileser III (745–727) and Sargon II (721–705) the city state of Tyre passed through a phase of economic prosperity due to the policy of the Assyrian sovereigns to strengthen the diplomatic and commercial ties with the royal house of the powerful Phoenician cities.¹⁸⁰⁰ The activities became feverish in the coastal centers of southern Syria, from which they could reach the heart of the empire more directly. Phoenician and Euboean merchants moved the products towards the capitals Nimrud and Khorsabad. These included metals that were necessary to fuel the imperial war machine and the state finances, and exotic luxury goods that made court life even more lavish and enhanced the endeavors of the Assyrian sovereigns. At the same time, precious artifacts from the eastern front made in the Syrian-Hittite and Assyrian capitals converged on the coast.

In this period, the Assyrian Empire rapidly extended westwards taking direct control of such key areas as the Taurus Mountains and Aman, and gradually incorporated the neo-Hittite and Aramaic kingdoms. The strong military pressure exerted by Sargon II was therefore one of the principal causes of the influx of north Syrian workers into the Italian peninsula via the Tyrrhenian coast between the end of the eighth century and the beginning of the seventh. The phenomenon has been mainly observed in the fields of sculpture and architecture. The activity of northern Syrian sculptors might explain the emergence of enthroned figures in Etruscan statuary, one of the finest examples of which was found in the *Tomba delle Statue* at Ceri (690–670) (Fig. 35.4).¹⁸⁰¹ Even older examples of this type of sculpture are possibly documented at Veii,¹⁸⁰² and prove the existence of itinerant workshops able to satisfy the needs of the emerging aristocratic groups within central Italy's largest settlements. The diaspora of these Eastern sculptors is clearly visible in the two statues discovered at Casale Marittimo—a site that dominated communication between Volterra and the sea— which were

probably placed on a burial mound towards 670–650 (Fig. 45.7).¹⁸⁰³ Furthermore, references to the statuary of the neo-Hittite kingdoms have been identified in a series of funeral monuments made in Bologna and its territory, probably between the end of the second and third quarter of the seventh century.¹⁸⁰⁴

In architecture, however, the contribution of architects and northern Syrian craftsmen is especially noticeable in the construction of funerary structures,¹⁸⁰⁵ since the residences of the lords who were placed in the large Orientalizing tumuli are unknown. The influence on domestic architecture can be assumed on the basis of the subsequent constructions. The plans of the palaces of Murlo and Acquarossa show some similarities with the layout of *bit-hilani*, the rectangular Syrian palace built with porches.¹⁸⁰⁶

Fig. 34.11: Bronze “Phoenician-Cypriot” *oinochoe* from the “Tripod Tomb”, Cerveteri. Vatican, Gregorian Etruscan Museum

An Eastern matrix is also recognizable for some artifacts directly inspired by court ceremony, such as fans, scepters and footstools.¹⁸⁰⁷ Focusing on the latter, the oldest finds from the Tyrrhenian area are from the famous ‘Tomb of

the Warrior' 871 from the necropolis at Casale del Fosso, at Veii and from tomb 93 of the Laurentina, which dates to the last quarter of the eighth century. One such find is a bronze footstool with voluted support, also known as "Ceri type," as it is the same depicted in the *Tomba delle Statue*, and its presence is concentrated across central Italy. The bronze creations from Veii, Laurentina, Castel di Decima and Trevignano Romano find their equivalent in the Adriatic area in the splendid wooden creations from Verucchio.¹⁸⁰⁸ This writer¹⁸⁰⁹ believes that the reference models for these artifacts must be sought in Syria, where over the course of the ninth century an original elaboration of Egyptian-Phoenician footstools are added, whose tradition goes back as far as the beginning of the second millennium.¹⁸¹⁰ It should also be emphasized that in the passage from east to west, the ideological message connected to this piece of furniture—considered the prerogative of divine beings, kings and princes—remained unchanged. In fact the presence of the footstool in the Syrian-Anatolian funerary reliefs gave the scene a connotation of rank, and a symbolic meaning related to a possible deification or heroization of the figure of the deceased as an ancestral founder.¹⁸¹¹ The same symbolic message is behind the monumental statuary of Ceri and Veii and proves that the Eastern influence is strong in the funeral ideology and is closely mixed with the Greek one.¹⁸¹²

Fig. 34.12: Bronze torch-holder, probably from the Monte Abatone necropolis, Cerveteri. Vatican, Gregorian Etruscan Museum

It is therefore likely that there was a similar situation for the Tyrrhenian area of the Italian peninsula, as shown in the royal necropolis of Salamis. In these “heroic” graves inspired by Homeric poems, Eastern luxury goods were accumulated to display the *tryphé* of the local aristocracies.¹⁸¹³ Furthermore, the contacts with Cyprus are evidenced not only by drinking services in precious metals (Fig. 34.11),¹⁸¹⁴ or precious artifacts such as bronze torch-holders (Fig. 34.12)¹⁸¹⁵ used to illuminate or scent the rooms, which have been found in the rich Orientalizing tombs of Etruria and Latium vetus, but also by the design of the tumuli. Recently, with reference to the *Tumulo della Regina*, in Tarquinia, the use of alabaster plaster for the walls of the halls destined to host pictorial decorations, has suggested the participation of Eastern crafts-men in the construction of the tomb.¹⁸¹⁶ In this period, Caere attracted the interests of Greek and Levantine traders more than any other Etruscan city. By focusing on the Eastern component, the recognition of Phoenician pottery in some tombs there has suggested the presence of foreign elements,¹⁸¹⁷ which is known to have been frequented not only by

commercial agents, who perhaps stayed there temporarily, but also artisans. Accredited research lines have located workshops at Caere for the production of ointment bottles and other small objects in glass paste,¹⁸¹⁸ but it is also possible that during the seventh century, north Syrian and Cypriot-Phoenician metalworking experts also operated there.¹⁸¹⁹ The presence of Phoenician artisans in the Italian peninsula has been confirmed by the transmission of working techniques connected with the decoration of ivory¹⁸²⁰ and ostrich eggs. For this last class of material investigations have led to the recognition of an active workshop at Vulci in the second half of the seventh century.¹⁸²¹

Fig. 34.13: Bronze ribbed cup with Phoenician inscription from tomb 3 of KfarVeradim (Upper Galilee) (from Alexandre 2002)

Fig. 34.14: Ceramic tripod bowl from *Othoca* (Sardinia). Soprintendenza Archeologia della Sardegna

The attendance at Assyrian courts by Phoenician commercial agents was another reason for the arrival of Mesopotamian artifacts and their imitations on the continent. This trend can be clearly seen in the study of ribbed bronze cups. In effect, the careful philological work conducted on the examples found in the Italian peninsula has allowed us to identify the artifacts directly imported from Assyria and from Urartu and the work related to the Phoenician workshops that were active in the motherland (Fig. 34.13).¹⁸²²

The study on the ribbed cups has found significant points of contact with a line of my own research intended to emphasize the spread of a particular way of drinking wine among the Latin and Etruscan aristocracy that originated in the northern Syrian area in the first half of the eighth century.¹⁸²³ It is rooted early on in Assyria and was introduced into the West by Phoenicians¹⁸²⁴ and is based on the consumption of wine flavored with spices and resin that were crushed using a ceramic tripod bowl (Fig. 34.14). At this point the ceremony used sets composed of elements which filtered and deposited the aromas introduced in the drink. A precious example, produced in Assyrian workshops, is the jug with an incorporated filter and long spout now in the British Museum (Fig. 34.15), which came from southern Italy.¹⁸²⁵ In case not all of the aromatic particles were filtered out, in Assyria around the mid eighth century, lenticular ribbed cups began to be used, whose accentuated carinate gathered the sediments in the drink. Because its use was so specific, linked to the consumption of aromatized wine, in the East, the ribbed cups in precious metals were the prerogative of the king and of the royal couple,¹⁸²⁶ as clearly shown in the famous relief of the “Garden Party” in the North Palace at Nineveh, where Assurbanipal and his consort are portrayed in the defining moment of the toast (Fig. 34.16).

Fig. 34.15: Bronze jug with spout and incorporated strainer in the British Museum
(from Moorey 1980)

Fig. 34.16: Detail of “The Garden Party” from the North Palace at Nineveh

The use of ribbed cups as libation bowls according to the Syrian method of consuming aromatized wine, is clear in Italy from the association of the tripod bowl. This is exemplified by the grave goods from tomb 15 of Castel di Decima (end of the eighth century), which also contained a colonial Phoenician wine amphora.¹⁸²⁷ In the East, the relation between the tripod bowl and the ribbed, carinated cups in the royal banquet is confirmed by the abovementioned Nineveh relief.¹⁸²⁸

9Conclusions

Through analyzing the relations between the eastern and western Mediterranean, from the beginning of the first millennium, we can distinguish two privileged lines of contact. The first and oldest was developed in Cyprus and by the principal coastal centers of Phoenicia to reach Sardinia mainly through island routes. In this phase, the capability of the Nuragic community is fully manifested in the way it reworked eastern contributions in a highly original and innovative way, both concerning the icono-graphic apparatus and also for some types of artifacts, which are mainly ceremonial bronzes. Furthermore, thanks to the efficiency of the Sardinian sailors, contact was made with the Iberian Peninsula and the mid-Tyrrhenian coast of Italy. In this case, the relations between the Nuragic and Villanovan elites intensified, especially in the north, which involved the centers of Vetulonia and

Populonia.

The second line is firmly established in the course of the eighth century with the intensification of the Euboean and Levantine presence in Campania. Thanks to the foundations of the emporia at al-Mina and Pithekoussai, artifacts, men and technologies from the southern Anatolian and northern Syrian areas quickly reached the Italian peninsula. However, already in the first half of the eighth century, the presence of Phoenicians was strengthened in the central Mediterranean with the foundation of Carthage in Tunisia, and Sulky in southwestern Sardinia. The rapid growth of the latter must have facilitated the arrival of luxury banquetting products on the mid-Tyrrhenian shores of the Italian peninsula, which were made in the Phoenician workshops of Cyprus and the mother country. At the same time, the early interest of the colony for its land must have encouraged the cultivation of grapes and the production of wine. The wine of Sulcis undoubtedly represented a driving force of the colony's economy, which reached the communities of Lazio and south Etruria early on.¹⁸²⁹

The seventh century was undoubtedly the high point of the relations between the Italian peninsula and the eastern Mediterranean. In this period, thanks to the activity of itinerant workshops of northern Syrian and Phoenician artisans, the Orientalizing art reached its apogee. Indeed, it is in the mid-Orientalizing period that there was a proliferation of Eastern-style artifacts that were imitated and refashioned *in loco* by Italian artisans following a successful cooperation with Eastern counterparts.

35Urban Civilization

Abstract: This essay outlines the development of urban communities in Etruria from the beginning of the Orientalizing period, at the end of the eighth century BCE. Through archaeological and historical sources, the formation of urban society is examined as a complex phenomenon that involves both economic and political ideological aspects. The study examines the institutional structures of the city-state, the dynamics of urban planning, the organization of the agricultural landscape, the system of trade, and crafts. It concludes with an analysis of the political crisis of urban societies in Etruria, which favored the conquest by Rome in the fourth-third centuries BCE.

Keywords: city-state; political community; institutional structures; urbanization; production.

Introduction: Origins

In the second half of the eighth century BCE, the proto-urban centers underwent a transformation in their social, political, and economic orders, whose material aspect is most strikingly manifested in the development of what is known as the Orientalizing period. This process is rooted in the dynamics of the internal development of the Villanovan community, which actively became part of the network of maritime traffic developing throughout the Mediterranean.¹⁸³⁰ In the local communities there arose concentrations of wealth, centralization of control over resources and production that led to the formation of a permanent, hereditary aristocracy.

The utilization of kinship ties is documented at the epigraphic level through the appearance of the binomial onomastic formula, already attested at the beginning of the seventh century: to the individual name (the *praenomen*), which constitutes the earliest form of personal identification, was added that of the family name (the *gentilicum*), which remains invariant and is transmitted by descent. The gentilic derives from the freezing of a patronymic designation, and therefore, being linked to the organization of the agnate *familia*, is patrilinear in nature.

The centrality of the family is confirmed by the adoption of the chamber tomb type, initially intended for married couples and later for multiple depositions of blood relatives: this was covered over by a tumulus that could be used for other burials of the same group, to reaffirm its continuity over time.

1 *Gentes and clientes*

The picture of a hereditary aristocracy drawn from the material culture corresponds to the image offered by the historical tradition that makes the fulcrum of Etruscan society the institution of the *gens*.

Because the gentilic model is described by fairly late authors (especially Livy and Dionysius of Halicarnassus), who are referring particularly to the Roman world, it is doubtful whether it should be applied to Archaic Etruria as well. The comparison is indispensable for focusing on the coordinates of aristocratic power, as it was reconstructed by the ancient historians.

The comparison between historical and archaeological sources cannot, however, be resolved by a mechanical superposition, as they reflect only fragments of a more complex ancient reality, filtered, moreover, through an ideological lens. Because each source constitutes an autonomous significant system, the mutual utilization passes through the description of the differences.¹⁸³¹

The historical sources describe the *gens* as an extensive social and economic structure, hinging on *kinship*, private *solidarity* relationships, and the *clientelae*.

This tripartite articulation is provided both by Livy and by Dionysius of Halicarnassus. The former cites the *cognati*, the *sodales*, and the *clientes*; the latter mentions the *syngeneia*, the *philoï* or *hetairoi*, and, for the *clientelae*, the *pelatai* or, less commonly, the *oiketai*.

The terms used are not vague. The concepts of *cognati* /*syngeneia* refer to wider consanguinity in comparison with the *familia* of the agnates (paternal kin); *sodales* / *hetairoi* / *philoï* ("companions" and "friends") reflect a personal link that is cemented in the military sphere. Emblematic is the so-called *Lapis Satricanus*, which memorializes a dedication to Mars in the sanctuary of *Mater Matuta* at Satricum (southern Latium) by "*sodales* of Publius Valerius," perhaps the Publius Valerius Publicola who was first consul in Rome after the deposition of the kings (Fig. 35.1).¹⁸³²

The obligation of personal solidarity takes on special importance in funerary rituals when the group celebrates the memory of the deceased and affirms its own cohesion.

A significant context is the Tomba delle Iscrizioni Graffite ("Tomb of the Inscriptions") of Caere (Cerveteri) (third quarter of the sixth century). Inscriptions were engraved around the doorway to the main chamber on the occasion of the burial of the deceased *Larice Veliinas*, probably the father of *Thefarie Velianas*, who is called the "king of Caere" on the bilingual tablets from Temple B in Pyrgi (Fig. 35.2).¹⁸³³ The main inscription commemorates a funeral rite performed by his wife, while the others consist of men's names associated with members of a small group of friends connected with the deceased, who gathered on the occasion of the funeral.

Fig. 35.1: *Lapis Satricanus* (photo SAR-Laz)

The sources distinguish the *sodales* from the *clientes*, who were bound by a relationship of individual subordination, which is conveyed by means of a vocabulary that references the *familia*: in the Latin sources, the lord is the *patronus*, endowed with a “paternal” authority; in the Greek sources, the clients are “those who stay nearby” (*pelatai*) or “those of the house” (*oiketai*).

Their dependency is not connected with slave status. The sources insist on the possibility of clients owning property and on the relationship of mutual assistance that they and the lord were bound to offer each other. Their condition is illustrated in a passage from Dionysius of Halicarnassus (*Ant. Rom.* 9.5.4–5) that describes the army of the Etruscan *principes* marshaled at Veii against the Roman army in 479. The Etruscan nobles head contingents formed from dependents called *penestai* (the “poor”), the name assigned to Thessalian *servi* with semi-free status, bound to the land, but the analogy does not serve to mark slave status; instead, it emphasizes the lack of freedom of an army that—unlike the Roman army—consisted of noncitizens in the service of a limited ruling class. Dionysius actually describes the fear of the Romans facing enemies marked by “the luster of their arms,” able to fight with order and discipline, with the *homonoia* that distinguishes an army of hoplites.

Endowed with an intermediate status between liberty and dependence, the clients represent a resource that widens the range of and develops the capacity for operation of the *gens*: they increased its productive ability, primarily in the sphere of agricultural activity.

The primary source of the gentile economy lies in the possession of a broad agricultural territory for cultivation and stock-raising, over which, thanks to the mechanisms of hereditary succession, unitary control was imposed to avoid the fragmentation and consequent weakening of the property.

The availability of an extensive agrarian base promoted the availability of a surplus to be placed into circulation in crafts production and trade, from which the centrality assumed by the aristocracy in the management of trade and the acquisition of prestige goods and advanced technology by attracting specialized manpower.

“egalitarian regality” was the basis of mediation in the management of power, fostered on the concrete relationships of strength.

One of the cornerstones of the gentile ideology consisted of the construction of a genealogical tradition under the sign of a common ancestor that anchored the family in history and in its territory. Hence, the centrality assumed by the system of funerary observance of the death of the *princeps*, heroized as a founder.

In this process, the reception of Greek myth that permits the ruling group to appropriate functional models for the elaboration of a “language of power” shared with the other Mediterranean aristocracies assumes a remarkable importance.¹⁸³⁷ The most symptomatic example comprises the repurposing of the figure of Odysseus. In Hesiod’s *Theogony*, again dating back to the end of the eighth century, the hero figures as the father of Agrius and Latinus “who ruled over all the famous Tyrrhenians (*Tyrsenoi*)” and were conceived with Circe (lines 1011–16).¹⁸³⁸ The genealogical invention established the solidarity of blood between the Greek world, the Tyrrhenian West and Odysseus, who in the course of his travels crossed the borders of the world and entered into contact with distant peoples and became the Greek progenitor of the Etruscans (Fig. 35.3).

Hesiod's mention of the *Tyrsenoi* takes on greater significance when we recall that the ethnonym is already attested very early in Etruscan epigraphy in the form of the gentilic *Tursikina* recorded on a gold fibula dating around the middle of the seventh century.¹⁸³⁹

Two additional elements take on a new and marked ideological content in the funerary ritual. First, the representativeness assigned to the classes of children, the pivot of hereditary succession;¹⁸⁴⁰ second, the “invention” of the ancestor cult, which is connected to the origin of the earliest monumental statuary in Etruria, attested both on the funerary level (Tomb of the Statues at Ceri, Tomb of the Five Chairs at Caere, necropolis of Casale Marittimo, Tumulus of the Pietrera at Vetulonia) and in palace architecture (*regia* of Murlo) (Figs. 35.4., 45.7).

Fig. 35.4: Tomb of the Statues at Ceri (after *StEtr* 52, 1984, 20 and 34)

The need to provide a connection with the past is also manifest in the general sphere of religious practices, in the not uncommon cases where the

new sacred areas of the Orientalizing period were established in locations that had already been used in the Iron Age for cultic functions.¹⁸⁴¹

Fig. 35.5: *Tabula Capuana* (after Rasenna. *Storia e civiltà degli Etruschi*, edited by G. Pugliese Carratelli, Milan 1986, fig. 252)

The occurrence of overlapping strategies underlines how the gentile dynamic was an essential factor in the wider consolidation of the political community, although the fabric of *the gentes* did not integrate all the components of the population. At a much more recent chronological horizon, the coexistence of multiple levels of organization within the political

community is documented, for example, in the *Tabula Capuana* of the first half of the fifth century (Fig. 35.5), where familial and gentile groups are associated with the performance of ritual activities.¹⁸⁴²

2The formation of the cities

The development of gentile structures created the conditions for the development of the cities as a unitary socio-economic formation, in which the concentration of productive strengths triggered an elevated capacity for planning.¹⁸⁴³

At the turn from the eighth to the seventh century, the archaeological evidence shows a generalized process of urban aggregation and territorial reorganization, connected to the consolidation of a political authority able to impose wide-ranging unitary strategies.

A clear example is represented by Pontecagnano in southern Campania, where at the end of the eighth century the Iron Age necropolises are supplanted by new burial areas closer to the built-up areas.¹⁸⁴⁴ The cemeteries occupy lowland regions retrieved through large-scale reclamation activities that imply a high level of labor organization, involving specialized technical ability and refined methods and manpower.

The planning of new necropolis areas reappears in many centers in Etruria proper. The best-known example is at Tarquinia, where the urban necropolis is located on the plateau at Monterozzi, which during the Early Iron Age was occupied by a village. The new “final destination” demonstrates a severe discontinuity in land management and the property system imposed by the new settlement strategies.¹⁸⁴⁵

At the same time, in the built-up areas there emerge the earliest structures of a public nature. These set forth a plan for the sacred and political areas that maintain a significant functional continuity. At Tarquinia, in the sacred area at Pian di Civita, which was already in use in the proto-historical period, the *Edificio Beta* was erected in the first quarter of the seventh century, built of stone using a technique imported from Oriental workers: ultimately, it was probably connected with an inaugural ritual consisting of the dedication of a bronze shield, axe, and *lituus* trumpet.¹⁸⁴⁶

The building is the heart of a sacred complex relating to a goddess, which developed at the time and was, eventually, integrated into the urban fabric of the Archaic city.

Fig. 35.6: The mudbrick house in Roselle (courtesy SAT)

At Roselle, in the area occupied in the Roman period by the Forum, in a neighborhood of huts a house of mud brick was built within an enclosure with a hearth and a large loom. The structure, which, as at Tarquinia, was built such that it would withstand the years, might be a sacred building or the residence of a chief (Fig. 35.6).

Its construction signals the onset of an exceptional continuity of function: at the end of the seventh century it was replaced by a two-room building that may have maintained the same function, and in the second half of the sixth century a temple was built in its immediate vicinity, clearly relating to a public space that in the Roman period was monumentalized by the Forum plaza.¹⁸⁴⁷ The Orientalizing house remained in the memory of the community: in the second half of the sixth century the area of the ancient forecourt received a votive deposit, which has yielded a dedication to the *aiser*, the “gods,” perhaps to be identified with the *Lares* of the city.¹⁸⁴⁸

In a similar vein, we see during the same period a move to the regular attendance of holy areas, that subsequently took on a monumental planning but that already in this period were intended for collective activities. This

phenomenon is documented, for example, in the sanctuary of the acropolis of Volterra or, in Campanian Etruria, in the sacred complex of Fondo Patturelli in Capua.¹⁸⁴⁹ At the beginning of the sixth century, a sanctuary dedicated to Apollo was founded at Pontecagnano on an older area of huts and pits, which had been in use from the end of the eighth century.

Already in its initial phase, the area was organized inside a plaza that constituted the oldest public space of the proto-urban center; it remained in use with the addition of the sanctuary, highlighting the power of suggestion exercised by the original planning.¹⁸⁵⁰

An equally significant aspect of the process of political formation consists of the beginning of permanent occupation of the vast territories that during the Iron Age fell into the ambit of the proto-urban centers.

The agricultural landscape was built up by means of the development of a network of “minor” settlements aimed at controlling strategic roads and resources. The exploitation of the countryside involved the organization of large gentile properties, marked by the tumuli distributed for a considerable distance from the city. The right of burial sanctioned the legitimate possession of land that would become that of the fathers and ancestors. The phenomenon emerges precociously in southern Etrurian centers like Caere and Tarquinia and is subsequently documented to a greater extent at Veii and Volterra in the second half of the seventh century, and at Chiusi and Cortona at the turn of the seventh to the sixth.

In the last of these, Tumulus II del Sodo deserves mention. It has a monumental altar meant for the funeral cult and a *sacellum* shrine at the top of the mound (Figs. 71.8.–71.9): the tomb of the lord is conceived as a sacred symbol marking the landscape.¹⁸⁵¹

From the end of the eighth century we see the formation of autonomous centers, reduced in size but provided with their own territory, which assured control of the areas farther from the urban centers. Thanks to this network, distant agricultural fields were acquired, the exploitation of mineral resources was developed more intensively, the network of long-distance connections was organized, and the control and protection of the waterways and coastal strips was established. The minor settlements depended on aristocratic families who were able to build monumental tumuli with attached cult areas (Tomba Cima near Barbarano, Grotta Porcina),¹⁸⁵² and create temples or residences similar to *regiae* (Castellina sul Marangone, Acquarossa, Poggio Buco), which served as expressions of a local power independent from the *gentes* of the main centers (Figs. 35.7.–35.8).¹⁸⁵³ These document the dynamism of the aristocratic groups ready to exploit the opportunities offered by a territory that was again opened, giving rise to a relationship between core urban center and minor settlements, which was not exhausted in a simple subordination.

Fig. 35.7: Tomba Cima near Barbarano (after Naso 1996, fig. 91)

At the same time there emerged settlement realities linked to social components that cannot immediately be assigned to the ruling groups.

From this perspective, the necropolis of Tolle in Chiusine territory is of considerable interest. It has yielded more than 700 tombs dating to as far back as the first half of the seventh century. The data presently available document a community that, on the funerary level, does not express the same levels as the aristocratic peaks, but is able to display symbols of prestige like the arms, canopic vases, or the occasional *kyathoi* with gift inscriptions that demonstrate their participation in a circuit of privileged relations at least around the middle of the seventh century (Fig. 35.9).¹⁸⁵⁴

Fig. 35.8: Terracotta frieze from Poggio Buco (photo SAT)

Fig. 35.9: Inscribed *kyathos* from the necropolis of Tolle (courtesy SAT)

We must, finally, note the contexts of Casalvecchio of Casale Marittimo, Castelnuovo Berardenga, and Murlo in northern Etruria. These were palatial residences created in the second half of the seventh century in an area without urban settlement, and can be attributed to small local dynasties that were founded as a means of establishing the possession of land and control of the roads between the coast and the interior.¹⁸⁵⁵

As shown especially by the example of Murlo, the palace represents the fulcrum of economic, political, and ceremonial activities of the group, where agricultural production flowed in, craftsmanship developed, and trade was carried out.

These complex responsibilities are documented by a series of *kyathoi* bearing gift formulas and ivory plaques that served as *tesserae hospitales*.¹⁸⁵⁶ The older evidence consists of *kyathoi* found at Casale Marittimo and Murlo: as in the case of Tolle, vases of the most refined ware, connected to wine offerings that, in the case of Murlo, had been given to the lord of the palace by a noble of Caere, to obtain permission for access and transit and to start trading. The *tesserae hospitales* found at Murlo are placed at the beginning of the sixth century and are produced by the palace, which controlled and guaranteed the management of traffic. On their backsides, they bear the names of the participants in the contract, and were kept by the interested parties to certify each other's identity. The documents still reflect an archaic system of economic relations, which, at least at the ideological level, continues to be integrated into the framework of personal relationships woven together by the lord.

3 Ethnicity, institutional forms, and magistracy

The archeological contexts provide evidence of the consolidation of an organization that involves the entire community and, as a consequence, of a political authority able to promote operational strategies over the *longue durée*. What form of government does this unitary power concretely represent?

The historical tradition goes back to the chronological horizon of Tarquinius Priscus and Servius Tullius, between the end of the seventh and the middle of the sixth centuries. The picture of the Etruscan city is one provided with its own political situation (*politeia*) and guided by a king chosen from the ruling class of *principes/ dynatatoi*. The power of the king was issued by the aristocracy, and the supreme representative of the Federal League is defined by Livy (1.8.3) as the *communiter creatus rex*, taking the function of an elected magistrate. This reconstruction of the Etruscan system of government shares many similarities and is perhaps conditioned by comparisons with the framework of monarchic Rome, but the sources present the essential data of a political equilibrium, founded on the balance of power of the *gentes* that safeguarded their collective interests against the risk of the royal authority's abuse of power.

The gentile organization guarantees the stability of the institution, and therefore the functioning of a system in equilibrium, which allows for the control of resources and means of production, and assures the privilege of the ruling class. This implies a system of negotiations based on mutual controls and guarantees, in which the strength of collective identity is also consolidated, cemented in the participation in space, ceremony, and communal decisions.

The leading role of the aristocracy in the construction of the political landscape emerges archaeologically in the planning of monumental quarters like that of the Piazza d'Armi in Veii or Vigna Parrocchiale in Caere. The former, built around the middle of the seventh century, began as a real, self-sufficient citadel independent from the principal flatland of the Etruscan city. Its foundation is built around an Iron Age pit burial found within the dwelling, guarded within a "house of wood," to which has been attributed a function similar to that of a *heroon*.¹⁸⁵⁷ A temple was built at the end of the seventh century that was decorated with friezes depicting the parade of a leader on a cart with a procession of hoplites on horses or on foot (Fig. 35.10).

Fig. 35.10: Terracotta frieze from the Piazza d'Armi at Veii (photo SAR-Laz)

The Piazza d'Armi group marks, therefore, the real difference from the rest of the community, emphasizing a privileged relationship with the god, even physically approaching his residence. The same logic distinguishes the complex, which may be royal in character, of Vigna Parrocchiale in Caere which, at the turn from the seventh to the sixth centuries, was built in the heart of the old city near a sacred precinct dedicated to *Uni* (the Greek *Hera*).¹⁸⁵⁸ Still clearer is the case of the *regia* of Acquarossa, which dates to the third quarter of the sixth century. The palace is close enough to a temple structure that all but guarantees the preservation of the ruling family.

Essential evidence of the process of political structuring is represented by the texts relating to the institutional apparatus and the magistracy. This is a corpus that is neither broad nor homogeneous, but which agrees in focusing on certain essential evolutionary lines. We must begin with the term *rasna*, a word that is inseparable from the name *Rasenna*, which Dionysius of Halicarnassus (*Ant. Rom.* 1.30.3) attributes to the main eponym (*hegemon*) of the Etruscans “who are called the same as this.” *Rasna* represents the ethnonym of the Etruscans, but above all takes on a socio-institutional significance, evoking the community of free males according to a notion not dissimilar from that expressed by the Latin *populus*.¹⁸⁵⁹ The term designates

the ethnic group by way of a mechanism of “contrastive identity,” with which the community claims a full assertion of the self, distinguished from all the others that do not represent the “people,” who differ in language and territory. It is emblematic that in Latin the Etruscan Federal League is called the *duodecim populi*. The definition of the ethnic group could go back to a much earlier period in the process of formation of the Etruscans, but the notion of *rasna* was still functional in the historic period: the earliest attestation, effectively contemporaneous with the ethnonym reflected in the gentilic *turkisina* inscribed on the fibula from Castelluccio di Pienza, appears in an inscription found in a tomb at Pontecagnano of the mid seventh century (Tomb 3509), where it occurs in the archaic form *rasunie* (Fig. 73.7).¹⁸⁶⁰

The most important written source for the institutional lexicon of Etruscan is the *Liber Linteus* of Zagreb, a liturgical instruction manual connected to the calendar and to the places of cultic practice that dates to the first half of the second century.¹⁸⁶¹ The *Liber* includes a few terms that designate the city and the political community. Among them, *spura* designates “the public, urban, and territorial entity,” with a concept similar but not identical to the earlier notion of *rasna* and fairly comparable with the Greek notion of *polis*.¹⁸⁶²

In the Archaic period, the occurrence of the personal name *spurie* is interesting, which could have a meaning similar to that of the Latin *Publius*/*Publicius*: from “public” meaning “what pertains to the entirety of the cives.”

In addition to *spura*, of note are *methlum* and *cilth*. The former coincides with the concept of *urbs*, the city in its physical aspect, as opposed to the *spura*, which also covers the *ager*; in the latter, it has been suggested to recognize the acropolis (*arx*), but this hypothesis has not achieved unanimous acceptance.

Names of magistracies also appear in the texts: the noticeable differences between one center and another evidence the particularity of the institutional arrangements.¹⁸⁶³ The term *zilath* designates the supreme magistrate, invested with an authority comparable to that of the king and, at the same time, to that of the *praetores* who, upon the fall of the monarchy, represented the highest political and military position in Rome.

The title appears for the first time on Cippus II from Rubiera near Modena, a memorial stone inscribed at the end of the seventh century, belonging to a lady called *Kuvei Puleisnai*.¹⁸⁶⁴ The inscription mentions a person who “was *zilath* at *Misala*” (or at *Sala*, according to another suggestion), probably a military chief with magistral authority, perhaps in relation to the main center of Bologna. A key document for deepening the function of the office and its evolution is the bilingual text in Etruscan and Phoenician on the gold tablets from Pyrgi, which date to the end of the sixth century, in which is commemorated the dedication of Temple B by *Thefarie Velianas*. In the Phoenician version he is called “king of Caere,” to which in Etruscan corresponds the office called *zilac seleita*, which takes on a multi-year character: the title thus defines a supreme power identified in the Phoenician

text as royal, whose function seems to be clarified in the Etruscan version with the adjective *seleita* and the repeatable nature of the position. The *zilath seleita* of Caere is therefore supposed to be a supreme magistrate identifiable with the *praetor maximus* of Rome. In *Thefarie Velianas* it can be recognized as a tyrannical figure by the nature of the authority that is exercised, a role that is, nevertheless, sanctioned in the institutional framework of the political community.

The Archaic documents detail a stage in which the position of *zilath* has already assumed the magistral sense, as the authority of the king that shines through in the sources and, at the same time, like the tyrannical power exercised by Porsenna, who in the tradition figures as the king of Orvieto and Chiusi.¹⁸⁶⁵ The jurisdiction of the *zilath* turn out to be much more articulated in the later epigraphic documentation, which comes especially from Tarquinia, where the title can appear alone, indicating the highest magistrate, or is associated with terms relating to institutional articulation. From the end of the fifth century, the position of a *zilath*, which was perhaps a position for life, qualified with jurisdiction over the *rasna*, which is to say, it was placed over the entire people of the city (*zilath mechl rasnal* = *praetor rei publicae*). The annual magistrate, who was connected to the urban community, probably would have assumed the title *zilath spurana*, that is, relating to the *spura*.

It has, moreover, been proposed to identify the supreme representative of the Federal League “of the twelve peoples” as the *zilath cechaneri*, who was responsible “for the superior things.” The title is associated with a figure represented with the highest magistral insignia on the Tarquinian Tomb “del Convegno,” which dates to the early third century. (Colour plates 42–47).

4Urbanization: The “isonomic” city

At the beginning of the sixth century, a decisive transformation of the nature of settlements took place, in which the city-formation dynamics culminate that had begun at the end of the eighth. Dwellings were urbanized by means of functional planning that involved, among other things, the definition of public spaces—in particular sacred spaces—where the community was represented in a political identity that was wider than that of the *gens*.

The public *sacra* were separate from the cults of the *gentes* and spaces were reserved for them that marked the landscape of the city and of its territory. This process united Etruria with the more developed regions of ancient Italy, like Latium and Rome, Campania and Magna Graecia. Urbanization marked the interaction between communities with similar economic and social bases, which were founded on control by the aristocracy. The development of the city brought about an extensive system of public and private consumption, nourished both by a monumental urban texture that required continual

maintenance, and by the needs of a growing population, which was attracted by the opportunity for improved living conditions. There thus arose an expansion of demand and of the productive dynamics where artisanal activities and commerce acquire importance. This process favored the formation of new social forces: an urban aristocracy linked to portable wealth, and a broad subordinate stratum that furnished the labor—both simple manpower and a skilled workforce.

The achievement of a wider community than that of the *gens*, however, did not produce a citizen class of free men, and a limited number of people with full political rights continued to contrast with a more extended social body that remained excluded, while also being included within the renewed mechanisms of production. This brought about the conditions for social conflict, similar to that between patricians and plebeians in Rome, which culminated in the profound crisis of the fifth century.¹⁸⁶⁶ How is the reformed city manifested archaeologically? In many centers it is found in the planning of installations based on a regular street grid. Besides the case already mentioned of the Piazza d'Armi neighborhood in Veii, early examples are found in Campania, in Capua (Siepone quarter) and in Pompeii, whose construction was laid out in the first half of the sixth century. The phenomenon spread especially at the end of that century, through the adoption of grid planning *per strigas* from the colonial world of Magna Graecia.¹⁸⁶⁷ It was adopted over a broad territorial arc—in the Po Valley, at Spina, Forcello, and Marzabotto; in central Etruria at Prato-Gonfienti, on the Tyrrhenian coast at the harbor sites of Pyrgi, Regisvilla, and perhaps Gravisca and in the industrial center of Doganella in the valley of the Albegna; in Campania, at Fratte and Pontecagnano.¹⁸⁶⁸ The new planning was conceived as a founding act and was sometimes sealed with an inaugural ritual. The clearest example is Marzabotto. The urban planning has an astronomical orientation, crowned by the acropolis on which the *auguraculum* was established. The city received the name *kainua*, which means “new city,” on the same principle used in Campania for the Greek *Neapo-lis*.¹⁸⁶⁹ By regular planning, the urban community achieved an “isonomic” landscape, expressing the superiority of the collective norm over any particularism. The planning could be realized through meaningful solutions of continuity in the settlements. At the beginning of the fifth century the aristocratic quarters of the Piazza d'Armi in Veii and Vigna Parrocchiale in Caere ceased to exist. At Veii, the area of the Piazza d'Armi was abandoned; at Caere the Archaic-period complex was razed to the ground and upon it were erected a Tuscanic temple and a monumental elliptical construction, perhaps a building for assemblies like Greek *bouleuteria* or *comitium* at Rome.¹⁸⁷⁰ The functional discontinuity signals a breach of the political order comparable to the expropriation of the property of the Tarquins upon the fall of the monarchy in Rome, which led to the establishment of the *Campus Martius*.

Fig. 35.11: Orvieto: necropolis of Crocifisso del Tufo (photo A. Naso)

The model of an “isonomic” community is also manifested in the funerary realm, which extols the harmony of the new urban elite. At the beginning of the sixth century at Caere and Orvieto there developed the standardized type of the “cubic tomb” (It. *tomba a dado*) a small rectangular chamber intended for a married couple, built above the ground and covered by a terrace designed to receive memorial stones. Tombs of the new type are included in their own funerary blocks, lining long roads that articulate the fabric of the necropolis. The best-known example is the Orvieto necropolis of Crocifisso del Tufo, built with its own structure *per strigas*. On their entrance doors, the tombs bear the names of the owners, identified by the binomial formula that by then marked the status of a free man; the names reflect a composite population that includes elements of both Italic and Greek origin (Fig. 35.11).

On a regional scale, similar dynamics of inclusion reveal the reorganization of the onomastic system in which, at the turn of the seventh to the sixth century, new gentilics appeared based on individual names, relating to elements of more recent political integration. The traditional gentilic names, formed from patronymic adjectives, are then declined in the genitive, to mark the onomastic patrimony of the more consolidated aristocracy.¹⁸⁷¹

5Agrarian landscape, production, commerce

The consolidation of the urban institution can be clearly demonstrated by looking at the organization of the agrarian landscape, a target in the Archaic period of intensive exploitation that documents a real process of internal colonization.¹⁸⁷² The urbanization of a growing population required an increased food supply and sharpened the need for arable land, which was satisfied by widening control over the countryside and improving agricultural technique. The availability of arable land was a prime reason for the flourishing of Orvieto, which was linked to the exploitation of the fertile valley of the Paglia. According to the sources, the city provided grain for Rome during the repeated famines that afflicted the City through the fifth century.¹⁸⁷³

The cities expanded their control at the expense of the settlements that had previously arisen in their orbit. This involved the destruction of the “minor” centers, as happened in the case of Acquarossa, probably by Tarquinia; of Poggio Buco, by Vulci; and of the residences of Casalvecchio and Murlo, whose territories were absorbed by Volterra and by Chiusi or Roselle.

The Late Archaic organization of the agrarian space documents the existence of extensive drainage systems and reclamation work, such as tunnels, canals, and ditches. Such extensive reshaping of the land happened via the network of underground tunnels that reclaimed the Pontine plain and the territories of Veii and Caere, and via the system of canalization of the wetlands in the hinterland of Adria in the last decades of the sixth century.¹⁸⁷⁴ At Adria, Pontecagnano, and Prato-Gonfienti, the division of the land is contemporary with the urban planning, to underline the unitary character of the process of political reorganization.¹⁸⁷⁵ The organization of the countryside favored the development of a specialized culture based on a stable network of small villages and farms that supported a diffuse and widespread population. At Veii, a land occupation has come to light based on farms directly dependent on the urban center. At Caere, the agricultural exploitation is articulated in the form of small neighboring farms, larger complexes that also had residential areas, and more extended settlements related to the territory and to the coastal strip. The construction of the agrarian space produced the formation of a class of small landowners or assignees, whose political status and degree of autonomy or dependency are difficult to specify. Nonetheless, the ownership of land consolidated an intermediate social stratum, included in the ancient sources in the category of *servi*, which became a component that was inevitably antagonistic within the urban population, as happened with the plebeians in Rome.

The emergence of an intermediate component, an alternative to the traditional aristocracy, is also connected with the surge in quality that arose in productive activity and in the exchange system. The growing needs of the urban community caused an increase in public and private demand, and

therefore an increase in production. The improvement of the system led to the production of a surplus that fed maritime commerce, with Etruscan goods the object of extensive export to southern Gaul, Sardinia and Sicily, and eventually Carthage.¹⁸⁷⁶

Trade between that mighty African city and Rome and its allies (probably including Caere) was regulated beginning in 509 by a treaty quoted by Polybius (3.22–23), which established the limits of navigation, landing, and trade by any of the contracting parties. The Carthaginians claimed Sardinia and part of Sicily, and the Romans claimed control of the territory of Latium and, in particular, of the centers on the coast as far as Circe's promontory.¹⁸⁷⁷ On the Tyrrhenian coast, the trade network relied on a system of harbors and minor slips that dot the landscape as far as north to Pisa at the mouth of the Arno. The landings outline a small-scale route along which Greek vessels and goods traveled, heading for the Phocian city of Marseille.¹⁸⁷⁸ On the Adriatic coast, the main ports were at Adria and Spina, with the first one frequented early by the Greeks; they were the ends either of a route that joined Greece to Padanian Etruria or of a long-distance route to and from central Europe. The urban authority controlled exchange, reserving for this function real *emporion* near the ports. The exchanges were located under the protection of sanctuaries within a friendly environment under divine protection. The context that has provided the most information is the sanctuary of Gravisca, in which an exceptional series of dedications in Greek allow for the identification of the merchants' origin. They initially came from eastern Greece, and after the Persian conquest of Ionia and Egypt, an Aeginan component emerged at the end of the sixth century, documented by the dedication to Apollo by Sostratos, identifiable as a merchant celebrated by Herodotus (4.152) for his wealth and incomparable ability (Fig. 35.12).¹⁸⁷⁹

Fig. 35.12: Dedication by Sostratos from Gravisca (photo SAR-Laz)

6The crisis

The intense development of the Archaic Etruscan cities triggered elements of internal contradiction that eventually led the system to crisis. The consolidation of the urban institutions and productive and commercial activity was not accompanied by the sort of political reforms that in Rome and Magna Graecia led, not without limits and ambiguities, to the assertion of an autonomous class of free citizens. To contain the development of new, potentially antagonistic social components, the ruling classes carried out a

rigid policy to depress the productive activity on which urban consumption was sustained. This triggered a crisis both of public commission and of the agrarian population, where a class of small free landowners was not consolidated and a peopling based on control of the great aristocratic families recovered vigor.¹⁸⁸⁰

The conflict over land was not exclusive to Etruscan society, but concerns the system of oligarchic cities of ancient Italy. It suffices to mention the struggle between patricians and plebeians in Rome, which was overcome only with the distribution of the *ager* of Veii after the conquest of the Etruscan city in 396. The unsuccessful construction of a political community weakened the renewal of the social body and the capacity for resistance against external adversaries: a weakness that proved fatal at the moment of the clash with Rome.

Already from the middle of the fifth century, the crisis had manifested in southern Tyrrhenian Etruria, Latium and Campania, and was aggravated by the defeat in the naval battle of Cuma in 474. By the end of the fifth century, it had completely overwhelmed the Etruscan world, which was incapable of resisting the pressure of the Italic population that was poised on the edge of its territory, and would soon gain possession of the fertile agrarian plain. At the beginning of the fifth century, the Volsci occupied the Pontine plain at the same time as the Samnites settled the Sarno Valley and the plain of Nola. According to the literary sources in 438 on the plain of Volturno was formed the people of Campani, who shortly afterward conquered Capua and Cuma. At the end of the century, the Gauls invaded the Po Valley, only to flood as far south as Rome, sacking it in 390. So rapid a conquest depended—other than on the weakened internal political cohesion—on a concentration of land ownership that favored the *latifundium* (large estates). The Gauls, who were about to attack Chiusi, demanded the right to seize the land from the owners “which they possess to a greater extent than they can cultivate” (Livy 5.36).

The rigid closing of the social structure condemned a political system that did not know how to free itself from the *principes* and continued to sustain itself on the Archaic opposition between *domini* and *servi*. The end came at Orvieto, in the slave revolt that overwhelmed the city in 265–264 (Zonar. 8.7.4–8; Flor. 1.16; Val. Max. 9.1 *ext.* 2; Oros. 4.5.3–5). The local aristocracy appealed to Rome for aid to defend against the *servi* or *oiketai*, according to the Latin or Greek sources, who—already managing the military service and the administration—demanded rights that had been acquired by the plebeians in Rome at least a century earlier, including marriage with patrician women and access to public office. The request for intervention provoked the military conquest by Rome and the destruction of the city and the federal sanctuary of the *fanum Voltumnae*. This signaled the conclusion of political autonomy of the Etruscan world—the consul M. Fulvius Flaccus triumphantly bore off the colossal booty of 2000 bronze statues from the sacked sanctuary.

36Hellenism in Central Italy

Abstract: The arrival of Hellenistic culture in central Italy during the last decades of the fourth century and the beginning of the third was a major phenomenon. The new craft and artistic language developed in Macedonia and in the various regions of the Hellenistic Mediterranean was very broadly welcomed by the Etruscan, as well as Italic and Roman, elites, who made considerable use of it in their enterprises of self-representation, along the way establishing a cultural *koine*. The proliferation of aristocratic monuments (honorific statues and portraits, painted and carved tombs) and more ordinary items exhibits the very wide diffusion of a repertoire borrowed from the Hellenistic courts. These iconographic and stylistic innovations were accompanied by a deep-seated renewal of cultural frameworks and religious and ideological references, which with the Roman conquest of the peninsula made its lasting mark on ancient Italy.

Keywords: Hellenism, painting, portrait, Rome

Introduction

The years between the mid fourth and mid third centuries BCE constituted a decisive period in the history of the Italian peninsula, especially of central Italy.¹⁸⁸¹ First of all, it was in these years that Rome definitively gained the upper hand over the great cities of southern Etruria and began to incorporate the Etruscan world into its nascent empire.¹⁸⁸² The fourth century, which had opened with the taking of Veii, the first Etruscan city conquered by the Romans, in 396, was marked by a seesawing of violent conflicts and precarious truces, which persisted all the way into the first decades of the next century. In the third century, Rome achieved the definitive surrender of the principal Etruscan cities and the establishment of Roman colonies on their territories. Etruria was not the only region of Italy to be progressively conquered by Rome; after a matching movement to the south in the last decades of the fourth century and the beginning of the third, Rome established its stranglehold on Latium and Campania and seized Taranto in 272.

But besides being a period of political conflict and military confrontation, these decades, corresponding to what has come to be called the end of the Classical era and the beginning of the Hellenistic age, were marked by a profound cultural renewal in the forms of language, religion, political institutions as well as the representational arts. Above all, this cultural renewal reached the various regions of Italy and appears to have been widely shared even by adversaries, including the new Roman power and the various

cities in the north and south of the peninsula, which attempted to defy Rome's power or had already succumbed to it. In this sense, the Roman conquest merely confirmed and reinforced a cultural unity that had already essentially been accomplished, borne above all by the various local elites: whether Etruscan, Roman, or Italic, they are characterized by profound Hellenization, visible in the ideological frameworks to which they adhered just as much as in their material and representational culture.

1The origins of Hellenism

Thus, while the study of the Etruscan cities in this period must, to a considerable extent, take into account the cultural situation in the rest of Italy, especially Rome, it must also be extended to the rest of the Mediterranean. The renewal affecting the peninsula found its source in the Greek world of the middle decades of the fourth century, and particularly in Macedonia.

Philip II, who ruled from 359 to 336, basically made this kingdom north of Greece the leading power of the Greek world, politically supplanting great cities like Athens, which was defeated in 338 in the battle of Chaeronea. The Macedonian court, to which Philip attracted the greatest artists of the era, also became a fertile center for the creation of art and of craft, as has been shown by the many archaeological discoveries of recent decades.¹⁸⁸³ The palaces and the princely necropolises of Macedonia have yielded works that have considerably altered our understanding of Greek art of this period and have provided a better understanding of the origins of Hellenistic culture. This is especially true for painting, where the decoration of the royal tombs (beginning with that of Philip II himself; [Fig. 36.1](#)) allows us to assess its extraordinary refinement.¹⁸⁸⁴ It is also true for the luxury crafts, whose richness is illustrated by the development of objects in gold and ivory, which provide a foretaste of the splendors to come in the Hellenistic courts.

This exceptional cultural plenitude, which is actually part of a more general movement for renewal of the Greek artistic language, was to find its finest ambassador in the person of Alexander the Great. Succeeding to the throne after the assassination of his father Philip II in 336, Alexander overturned the Mediterranean world in thirteen years by his policy of conquest. His victories over the king of Persia, Darius, at Issos in 333 opened the gates of the Orient to him; he led his troops to Egypt, Mesopotamia, and the banks of the Indus. In the process he created an immense kingdom, which stretched the boundaries of the Greek world. After the death of Alexander in Babylon in 323—conventionally taken as the beginning of the Hellenistic age—this territory was ripped into several kingdoms, headed by his lieutenants and successors (the Diadochi). That is how the great dynastic kingdoms were gradually created beginning at the end of the fourth century and in the first

decades of the third: the Macedonia of the Antigonides, Ptolemaic Egypt, the Seleucid kingdom in Asia Minor, and the kingdom of Pergamum of the Attalids.

Fig. 36.1: Vergina, tomb of Philip II, taken from the decoration of the facade (after Andronicos 1984, 101)

These kingdoms were to make a lasting mark on the political and cultural physiognomy of the Mediterranean world. The Roman conquest began in the second century, but was not completed until 31 BCE with the victory of Octavian (the future Augustus) over Antony and Cleopatra at Actium, which marked both the conquest of Ptolemaic Egypt and the end of the Hellenistic age. Up until it began, and even after, these kingdoms contributed to the reinforcement of the Hellenization of the Mediterranean brought about by Alexander. Above and beyond their political rivalries, they also contributed to the creation of a commonality of cultural benchmarks (beginning with the Greek language) and trends in crafts and art, a cultural and artistic *koine*,

which is one of the fundamental characteristics of the Mediterranean world of the time.

To a great extent, the power of this *koine* is explained by the place granted to the culture in the various centers, each of which attempted in its own way to claim and retrieve the cultural heritage of the Greek world, which so far had been embodied by the great cities like Athens. This is how the founding of the Museum and the great library of Alexandria by Ptolemy II, one of the principal achievements of the beginning of the Hellenistic age, must be understood. It was soon followed by the establishment of another great library at Pergamum, which was meant to compete with its great model in Alexandria. These great institutions of learning constitute one of the most characteristic and fruitful aspects of the Hellenistic age, which would provide the model for comparable organizations in imperial Rome and beyond, down to the present day. Concern for scholarship, the gathering of knowledge, and scientific research (from geography to medicine), which are at the heart of the Alexandrian enterprise, were equally signal characteristics of the new Hellenistic culture, and they meet in the field of art.

Hellenistic art is in fact an exceptionally intellectual, virtuoso, and eclectic art, which owes a great deal to the movement of artists and craftsmen among the various centers of the Hellenized Mediterranean and to their ability to adopt and refashion the various models available to them. It is also an intellectual art to the extent that artistic activity was accompanied by theoretical reflection about artistic activity, and that the new modes of representation, such as (in the area of painting) a new use of color and optical effects, are echoed in contemporary scientific research on the mechanisms of perception. The theoretical work likewise sustained the development of legitimate art criticism, which was endowed with its own technical vocabulary, and which classified the previous periods and artists and codified style and technique. The Hellenistic history of art created in this way is scarcely known to us except indirectly, through the Roman authors, especially Pliny the Elder, who were steeped in it,¹⁸⁸⁵ but it was to have an immense influence on the modern perception of ancient art, especially Hellenistic art.

2The reception of Hellenistic culture in Italy

The Hellenistic *koine*, which was largely responsible for the unity of a multipolar world, does not mean complete uniformity. The various centers, especially the capitals of the different kingdoms, preserved and developed obvious distinctions, notably linked to the prior existence of a strong local cultural identity. It suffices to cite the example of Ptolemaic Egypt, where the dynasty recuperated and adapted the Pharaonic heritage. It was no longer a question of the absolute Hellenization of the populations of these kingdoms;

especially at the beginning of the Hellenistic age, the new culture is primarily the work of the native and Greek elite of the capitals and major cities and diffused only fitfully among the autochthonous populations. It was no different in the non-Greek centers of the Mediterranean world, which also participated, to varying degrees, in the *koine*. Whether in Thrace, Punic North Africa, or Roman and Etruscan Italy, the impact of the new Hellenistic culture and the forms it took naturally depended on the receptivity of local societies and the filtering performed by the traditional framework for representation.

As for central Italy and Etruria in particular, the penetration of Hellenistic culture was undoubtedly greatly favored by the venerable and profound Hellenization of the local elites. This precocious Hellenization was largely due to the contacts maintained since the Orientalizing period with Greece itself, but also to the outposts of Greek culture in the peninsula represented by the colonies in southern Italy and Sicily. In the period of our concern, the role of Magna Graecia and Sicily did not cease. Major cities, beginning with Taranto, were one of the principal actors in the new Hellenistic culture, which they adopted fully and in the reworking of which they also participated. The presence of an artist as important as Lysippus at Taranto at the end of the fourth century suffices to show how much Magna Graecia was a leader of the innovations of the period. The ability of the Greek cities of southern Italy to appropriate and redistribute this Hellenistic culture constitute a decisive factor in understanding the transformations at work in central Italy.¹⁸⁸⁶ A good number of the major characteristics of the Hellenistic culture of the Latin and Etruscan cities were conveyed through and elaborated upon by Magna Graecia: not only the elements of a new figural language, but also some of the ways of thought and ideological concepts that underlie these new representations.

Even though other paths of transmission obviously existed, it was via southern Italy—whether by the spread of craft products or by traveling craftsmen—that the new compositional schemata and the technological and stylistic innovations were able to reach central Italy.¹⁸⁸⁷ This could be a way of explaining the early presence in the Tyrrhenian world of a certain number of basic elements of an early Hellenistic language. Of particular note are certain characteristics of the grand princely tombs of Macedonia, which were discovered in recent decades, that constitute the decisive monuments for understanding the alterations in artistic work between the end of the Classical period and the High Hellenistic. From the turn of the third century, it is significant to find—both at Naples (hypogeum of the Cristallini: [Fig. 36.2](#))¹⁸⁸⁸ and Caere (tomb of the Charons of Greppe Sant'Angelo)—the use of the previously unknown vaulted funerary chamber, a characteristic of Macedonian tombs. So also for sculpture, especially the great exterior adornments of the tombs of Caere, Tarquinia, or Vulci, which in both structure and style depend on models from Magna Graecia, notably the sculpted decorations of the necropolises of Taranto.¹⁸⁸⁹ The decoration of the

sanctuaries also testifies to the penetration of new stylistic formulas and their wide diffusion in the different cultural areas of central Italy. Among the most striking examples is thus the architectural ornamentation of the sanctuary of Scasato at Falerii in the Faliscan region, some of whose elements find very clear parallels in Latium, at Antemnae, and at Rome itself, which can be attributed to related, if not identical, workshops that also assimilated Tarantine influence.¹⁸⁹⁰

Fig. 36.2: Naples, hypogeum of the Cristallini (after Baldassarre 1998, pl. 2)

While the reception of Hellenistic culture in central Italy was considerably eased and influenced by cities and towns in Magna Graecia, particularly Taranto, it was also conditioned by the diversity of local situations. Each city and region evolved its own reactions to the new stylistic, iconographic, and cultural models. Like many other major centers of central Italy, the closeness of the links maintained with neighboring centers did not prevent the development of and demand for products of their own. The decorations of the sanctuaries of Falerii, show not only the importance and originality of the Faliscan terracotta workshops, but also the echoes they evoked in the Latin sanctuaries. Faliscan culture, whose links with southern Italy were old (as attested notably by the development of red-figure pottery in the fourth century), appears as an important conduit for Greek artistic languages to central Italy.

Likewise, in Latium, alongside the great center of Hellenism that Rome had become by this time, other cities asserted themselves as major centers of reception and retransmission of Greek models. This was especially so in Praeneste (Pal-estrina), where the production of bronzes provides a very clear indication of the diffusion of Hellenism in central Italy. For instance, bronze strigils were produced at Praeneste, objects that reflect the adoption of Greek practices, and which significantly bear craftsmen's marks in Greek.¹⁸⁹¹ The very wide spread of these items in central Italy (notably in Etruria and Picenum), either by traveling salesmen or by peripatetic craftsmen, demonstrates the role played by Praeneste and its craftsmen in the Hellenization of central Italy between the fourth and third centuries. This role is confirmed by the discovery in Etruria and Picenum of several rare bronze *cistae*, a typical product of Praeneste. The diffusion of these personal objects, which constituted marriage gifts and bear rich figural decoration, bring to light the phenomenon of family alliances and of traveling craftsmen from one region to another of Hellenistic Italy.¹⁸⁹²

3A case study: Hellenistic painting

One of the most striking aspects of the fate of Hellenistic culture in Italy was the adoption by local craftsmen of a new artistic language. The diffusion of stylistic innovations, which above and beyond the diversity of materials and iconographies constitutes one of the bases of the Hellenistic *koine* in the Mediterranean, is visible at various levels in most craft products of the age. But it is in painting that the range of innovations and the role played by Magna Graecia in their spread to Etruscan, Roman, and Italic artistic practice is best perceived. As shown by archaeological evidence, which largely agrees on this point with the ancient texts, pictorial art in the Greek world—like sculpture—played a driving role in the definition of a new figural culture.¹⁸⁹³

It is even more difficult to estimate the true nature of the original works than it is for sculpture, because most are lost, attested primarily only in Macedonian funerary painting. The variety of styles and patterns of composition employed in these royal handicrafts corresponds to the coexistence of a variety of competing workshops at the court of Philip II and then of Alexander.¹⁸⁹⁴ Although these workshops cannot always be directly related to the great painters' names that have been preserved in the written sources, they do reveal the extent of the innovations that began to develop at the end of the Classical period and that spread throughout the Hellenistic world, especially in Magna Graecia and, by way of the latter, through central Italy, where their echoes would be felt all the way down to the modern age.¹⁸⁹⁵

Unfortunately, the loss of the important civil and religious ornamentation, which is well attested by the textual sources especially in Rome, deprives us of the important creations of the time. We would love to know how the Roman temple of Salus was adorned by Fabius Pictor in 303, which was still Classically inspired if we trust the laudatory judgment of the Greek Dionysius of Halicarnassus (*Ant. Rom.* 16.3.6). Echoes of the great painting do, however, exist in the Roman and Italic world, which has preserved for us two of the most beautiful “derivative” works of Greek painting. One of them is the Ficoroni *cista*, which belongs to a class of objects made in the Latin city of Praeneste, but in this case was created in Rome itself, as shown by the signature of the craftsman, in Old Latin¹⁸⁹⁶ (*Dindia Macolnia fileai dedit, Novios Plautios med Romai fecid*—the Classical equivalent is *Dindia Macolnia filiae dedit, Novius Plautius me Romae fecit*). The decoration, illustrating the quest of the Argonauts (Fig. 36.3), reflects pictorial models—perhaps a specific presentation of grand themes that was famous in its day—once again largely Classical in inspiration, and shows the high degree of artistic intelligence on the part of those who commissioned the object as much as of the artist himself. The presence of the signature, which provides not only the name of the craftsman (*Novius Plautius*) but also the place of production, is a very clear indication of the status earned by these craftsmen in Rome and Latium in the mid fourth century.¹⁸⁹⁷ The second work to be mentioned, although it is later, is the Alexander mosaic, the centerpiece of the decoration of the very elegant House of the Faun, a Pompeian residence, the dimensions—and to a lesser extent the decor—of which belongs with the Macedonian palaces. In the second century BCE, the Samnite owner of the house made the choice to highlight a copy of a great pictorial composition from the very beginning of the Hellenistic period, an eloquent testimony to the pervasiveness and lasting prestige of the models of the new representational culture in the heritage of the Italic populations.¹⁸⁹⁸

Fig. 36.3: Ficoroni cista, taken from the decoration engraved on the walls (after Bordenache Battaglia and Emiliozzi 1990, pl. 302)

The actual pictorial materials, even though they often belong to minor genres or objects, are rich in information on the introduction into central Italy's craftsmanship of the new Hellenistic techniques of painting. Thus, the reorganization of the palette, especially a pronounced preference for colored backgrounds—in particular midnight blue and pink—appears clearly on the Sarcophagus of the Amazons, a characteristic item from the end of the fourth century, discovered at Tarquinia, whose links with the art of Magna Graecia, Taranto in particular, have recently been revealed.¹⁸⁹⁹ This painting on stone, of which a whole series of examples from the beginning of the third century are known in southern Italy,¹⁹⁰⁰ very clearly illustrates the new role color played in Hellenistic painting. One of the most characteristic items are the *pocola deorum*, vases made in Rome that depend to a great extent on the new cults introduced to the *Urbs* in this period.¹⁹⁰¹ These vases, whose Latin inscriptions call them *pocolom* and associate them with gods, bear overpainted decorations usually of a humble subject but realized with luminous touches of color (mostly white, but also yellow or red) that jump out of the black glaze background. Influenced by produced in southern Italy ceramics with overpainted decoration, perhaps through the arrival of craftsmen from Magna Graecia, this technique reveals the development within Roman craftsmanship of new techniques of contemporary painting, just as they are found in the same period in the work in the Tomb of the Garlands of Tarquinia as well as in the tombs of Macedonia, Alexandria, and southern Italy.¹⁹⁰²

4The circulation of iconographic models

Among the *pocola* one very important example stands out, both for its size and for its subject. This is a dish from Capena bearing the image of a combat elephant ridden by armed warriors and followed by a calf (Fig. 36.4). We know of other copies of this *pocolom*, found in Etruscan contexts, which like

most *pocola*, testify to the intensity of trade between Rome and the Etrurian cities in the first decades of the third century. The iconography reflects the introduction of the elephant into Hellenistic armies. The motive has sometimes been related to the campaign of Pyrrhus in southern Italy. It is in any case a typically Hellenistic composition, which demonstrates the arrival in the Roman workshops of sketches that were moreover very widely known. It is significant in this connection to find the same image at the other end of the Mediterranean, on silver Bactrian *phalerae* that, although later, probably go back to the same model.¹⁹⁰³

This very broad and very rapid circulation of iconographic models is a major characteristic of Hellenistic culture. The ability to adapt compositional sketches and this game of switching from one technique to another demonstrates the virtuosity of the Italian craftsmen, which characterized Hellenistic art from the beginning. From the ornamentation of the facade of the Tomb of Judgment in Lefkadia, where the metopes bear painted decoration simulating a relief and the reliefs of the frieze give a pictorial impression, this is easy to see.¹⁹⁰⁴ Similarly, the development of the mosaic—greatly refined at the end of the fourth century, based on archaeological evidence from the Macedonian houses of Pella—appears closely linked to the new pictorial models of the age, which became transposed to tapestries of the floor, made of pebbles, and also for some details of bits of terra-cotta or lead.¹⁹⁰⁵ Thus we see iconographic systems borrowed from major artists of the age laid down on different surfaces using varied techniques that attest to the investigations and innovations of the craftsmen of the age. This is the case, as we have seen, of the paintings imitated on the Ficoroni *cista* and in the Alexander mosaic; it may also be the case of the elephant motif of the *pocola*, which we might be tempted to relate to one of the panels by Apelles on Alexander's funerary carriage.¹⁹⁰⁶

Fig. 36.4: *Pocolom* (after Bianchi Bandinelli 1969, fig. 28)

The great painted cycles on the gentilic tombs of southern Etruria that are emblematic monuments of the development of painting in central Italy at the end of the Classical period and the very beginning of the Hellenistic age also provide a fairly precise idea of the abilities of the Italian craftsmen to assimilate and reuse contemporary systems of representation, which from then on were party to a shared figural culture. Thus the scene of the sacrifice of Trojan prisoners, depicted in the François Tomb, is simply the most successful version of an especially popular series—painted, engraved, or sculpted—created in the major centers of Italy: 1907 an Apulian krater, a Praenestine *cista*, a Faliscan *stamnos*, Etruscan stone sarcophagi and urns. More than seeking a hypothetical prototype (an *Urbild* that has most often, significantly, been situated in Magna Graecia), here we will be sensitive to the way in which the icono-graphic systems circulated among the various workshops of Italy and were readjusted by the craftsmen according to context and commission. 1908 The secondary decoration of the François Tomb allows this finding to be extended to the level of the decorative language, which in the Hellenistic age took on a new importance. This refers to friezes of animals in combat, one of the most common elements of the repertoire of the age, which simultaneously

appears in the form of reliefs on the walls of the Mercareccia tomb in Tarquinia. The motif was no doubt taken from the decoration of southern Italic fine furniture, notably on the gilded terra-cotta appliqués from Taranto, though it would have been found throughout the Mediterranean and beyond, on all sorts of surfaces.

5 Celebrating the aristocrat: The portrait

The Hellenization of central Italy, observable as we have seen in the appropriation of an artistic language developed in Greece or southern Italy, is equally characterized by a profound reworking of the frameworks of representation. Since Hellenistic culture is first and foremost a court art, which found fertile soil in the various capitals of the Hellenistic kingdoms, from the start it developed innovative ways of celebrating new Mediterranean dynasts, beginning with the art of the portrait. Alexander the Great's decision, reported by the ancient sources, to entrust his portraits exclusively to Apelles for painting, to Lysippus for sculpture, and to Pyrgoteles for gems,¹⁹⁰⁹ reveals the importance the sovereign attached to the reproduction of his image and to its diffusion. By being inspired by Alexander's model and by creating models of their own, Alexander's successors set up a repertoire of types and forms on which the elite and— gradually—the subordinate classes of the various regions of the Hellenistic Mediterranean could draw to ensure their own self-aggrandizement.

The Italian elite, whose resurgence is visible in the second half of the fourth century and the first decades of the third, would therein find one of the essential vectors of the affirmation of their identity and power. The development of the “Etrusco-Italic” portrait, one of the most original features of the representational culture of central Italy at the time, thus appears closely linked to the diffusion of the models at the beginning of the Hellenistic age.¹⁹¹⁰ It was first of all a public phenomenon: as with the dedication of temples, at the turn of the third century, the development of honorific statues celebrating the victorious generals became one of the chief elements of religious expression (connected above all to an ideology of victory that found its roots in the Hellenistic world) and of Roman political life as well. This ostentatious behavior was also shared by Etruscan aristocrats, as shown by several rare examples of bronze heads (no doubt some of which are the mere surviving remnants of life-sized statues), especially the head from Fiesole, now in the Louvre.¹⁹¹¹ Extensions of these practices into Italic regions are also found, as shown by the bronze head from San Giovanni Lipioni (Fig. 36.5) discovered in Samnium, whose disputed attribution (to a Roman or a Samnite general) indicates the commonality of language between the sides of central Italy.¹⁹¹² It should also be noted that the currency of the portrait is

equally demonstrated in the votive terra-cottas, which began to be produced at the end of the fourth century and provide some of the clearest evidence of the very wide diffusion of the Hellenistic figural culture in the societies of central Italy.

Fig. 36.5: Bronze head from San Giovanni Lipioni. Paris, Cabinet des médailles et des antiques (after Coarelli 2011, fig. 169)

Fig. 36.6: Sarcophagus of Scipio Barbatus. Vatican City, Vatican Museums (after *Italia omnium terrarum parens*, fig. 232)

These documents from the public sphere find their counterparts in the funerary domain, as attested especially by the beautiful portrait of *Vel Saties* in the François Tomb at Vulci, which represents the best parallel to the representations of those celebrated Roman triumphs of the time, which survive only in traces. Likewise, the painted decorations of the tombs of Tarquinia (Tomba degli Scudi or Tomb of the Shields), Capua, and Paestum, where the accent is placed on the status of the deceased and his place within the *gens*, once again show the close cultural and ideological relationship of the Etruscan, Roman, and Campanian elite.¹⁹¹³ Finally, alongside these painted portraits, the Etruscan sarcophagi also allow us to assess the fortune of the Hellenistic models, especially Ptolemaic portraits, among Etruscans who commissioned them in the first decades of the third century.

Given the absence of sufficient data on domestic decoration at this time, once again it is the funerary domain that best expresses the way the Etruscan and Italic aristocrats resorted to models from the Hellenistic monuments to make their status visible. We have already mentioned how the exteriors of the great gentile tombs of southern Etruria could take on a monumental aspect, taking the form (unfortunately not sufficiently recoverable in our present state of knowledge) of a shrine (*aedicula*) or at least of a sculpted exterior, the way it was done in Magna Graecia.¹⁹¹⁴ The most striking examples of monumentalization of the tomb and its facade may be sought in the rock-cut necropolises of Norchia and Sovana, which offer the best parallels to the great Hellenistic mausolea and especially once again to the examples in southern Italy. Even though it has hardly any monuments that are as spectacular (or ostentatious), Rome too testifies in its way to the penetration of the Greek models for memorializing the dead. The mausoleum of the Scipios, with the sarcophagus of Scipio Barbatus (Fig. 36.6), reveals how the expression of the

ideology of the deceased and his family had recourse to Greek models, which are clearly visible in the altar that lends its form to the sarcophagus itself, as well as in the values expressed in the eulogy inscribed on the monument. The insistence on his physical appearance in the celebration of the deceased (*forma*) and his moral worth (*virtus*) reflects the quintessentially Greek ideals of beauty and virtue of a man who is “handsome and valiant” (Gk. καλὸς κάγατός).¹⁹¹⁵

6The new cultural frameworks

The implicit reference to Greek values in the eulogy for Scipio Barbatus testifies to the adherence by the Roman elites to Greek culture that went beyond representational culture alone. The observation can be extended to the elites of other regions of central Italy: the use of new styles and new modes of representation is accompanied by very deep familiarity with cultural references from the Greek world. We are sometimes even tempted to speak of scholarship, in view of the obscure mythological subjects—and often only sparsely attested in Greece itself—that are used in some representational programs. This familiarity with Greek culture, which assumes mastery of the language by at least a portion of these social groups, is placed in the service of the aristocrats’ and their craftsmen’s own concerns. We might think of the development of a staging of historical traditions, primarily of the question of origins: Greek myth plays a fundamental role in the genealogical strategies and the discourses on identity of the elites of Italy at this time, as is well shown by the complex decoration of the François Tomb, where political, historical, and mythological references are intertwined. One may say as much of the corpus of Etruscan and Praenestine mirrors and especially of the Praenestine *cistae*, all of which summon mythological and sometimes historical knowledge. The commerce within Etruscan and Praenestine society of these feminine objects, which are associated with marriage and matrimonial strategizing, demonstrates their importance in the assertion of the values and culture of the aristocrats.¹⁹¹⁶

Finally, we may recall the influence in Italy of the various philosophical and religious doctrines developed in Greece and Magna Graecia, which participated in the complexity of the religious fervor of the age, where the very clear Greek influences blend into the traditional frameworks of the local religions. Beyond the diffuse and already ancient influence of Dionysianism, we should at least mention the impact of the Orphic-Pythagorean doctrines, detectable in some figural programs of the age, which testify that the new religious sensitivity was sometimes able to take esoteric or mystery forms. In a world where religion is inseparable from public life, the new trends in religion and thought also bore a non-negligible political weight. We have

already spoken of the importance of the development in Rome and Italy of an ideology of victory, in the Hellenistic mold. Pythagorean doctrines, which developed in Magna Graecia, notably Taranto, also had a profound influence on public life, as evidenced by Appius Claudius Caecus, who was also one of the emblematic figures in the changes at work in Rome between the end of the fourth century and the first decades of the third.¹⁹¹⁷ The erection of a statue of Pythagoras in the Roman Forum at about the same time is another shining example of the public reception in Rome of the political and philosophical models of the Greek world.¹⁹¹⁸

7Conclusion

The welcome given by the Roman *nobilitas* to these ideological concepts, inseparable from the reworking of the figural language of the time, explains how a fourth-century Greek could call Rome a Greek city (Gk. πόλις Ῥωμαίων;).¹⁹¹⁹ This view of the *Urbs* also explains the place occupied by Rome in the Mediterranean and Italian context at the end of the Classical period and the beginning of the Hellenistic age, and in particular its relationship with the Greek world. Still only a regional power, Rome began to establish its dominion over the center and south of the Italian peninsula and soon found itself confronted by the powerful Greek colonies of southern Italy but also by the new powers of the Hellenistic world. The Romans at first observed from a distance the expedition of Alexander I of Molossis, king of Epirus, who came in support of the Greek cities of southern Italy against the Italic peoples, just when his nephew and brother-in-law Alexander the Great set out to conquer the barbarian Orient.¹⁹²⁰ Relations between Rome and the great conqueror himself, if they existed at all, are documented in the imaginary historical reconstructions of later historians, such as a well-known excursus by the Roman historian Livy (9.16–17). What might have happened if Alexander had not died in Babylon and had turned his armies toward the West and Rome? It is significant that this question—entirely rhetorical, in that the Romans saw themselves emerging victorious in such a confrontation—was notably posed by Appius Claudius Caecus in a speech around 280, during the war against Pyrrhus, which was the first time the Romans faced a Hellenistic army. The happy outcome of the war and the taking of Taranto in 272 sealed this first phase of relations between Rome and the Hellenistic world, and definitively established Rome's dominion over central and southern Italy.

These few decades when Rome established its ascendancy over Italy and began to offer itself as intermediary for the great Hellenistic kingdoms were also the moment, as we have said, when the principal Etruscan cities confronted Rome and then lost their independence. Yet it is remarkable to

note how the cities most directly in touch with the Romans throughout this period and into the first decades of the third century preserved their cultural autonomy and their ability to adopt the innovations of the Hellenistic artistic language, which made them full participants in the Hellenistic *koine*. The gradual incorporation of Etruria into the incipient Roman Empire would change the game. The gradual decline of the cities of southern Etruria and the taking under guardianship of the cities of northern Etruria would make of Rome, beginning at the end of the third century, the real center of cultural power in Italy.¹⁹²¹ The second great phase of diffusion of Hellenistic culture, linked above all to the second-century Roman conquest of the Hellenistic kingdoms and to the influx into the *Urbs* of Greek artworks and craftsmen, definitively marks the cultural preeminence of Rome in Italy and throughout the Mediterranean. The renewal of the artistic language that followed in Italy is equally perceptible in the scenographic monumentalization of sanctuaries of Latium, beginning with the sanctuary of Fortuna at Praeneste, as in the decorations of alabaster urns in Volterra. But unlike what had happened during the fourth century and at the beginning of the third, when Hellenistic culture had been as much a phenomenon of the Italic and Etruscan elite as of the Roman, these new Hellenistic models from that point forward assume the mediation of Rome.

37Romanization

Abstract: The process of expansion of Rome into Etruria unfolded over a rather long span of time. The progressive expansionism of Rome in Italy also presupposes an ensemble of legal relationships that must be kept in mind. In general terms, the phenomenon that is usually referred to as “Romanization” assumes three factors:

- 1.capacity to organize and carry out conquest and in the process mitigate conflict.
- 2.capacity to give attention in a pragmatic and realistic way to the interests of the communities which progressively came under Roman control.
- 3.capacity to design diverse and flexible legal forms for the regulation of Rome’s relations with the newly conquered communities.

The Roman policy toward Etruria was not homogeneous and presents a variety of approaches that realistically reflect various socioeconomic situations. In the north, the Roman victory required a notable financial outlay on the part of the defeated community, with the consequent reinforcement of the ruling oligarchy; in the south, the Roman victory brought about extensive cessions of territory from the defeated community.

Romanization, even if this is taken simply to mean the assimilation of Roman customs by local populations, was necessarily accompanied by economic exploitation. The complex Roman road organization in the region is considered an essential feature of this policy, and consciously aimed to enhance the value of under populated areas such as the Albegna Valley that lent themselves to profitable cultivation.

Keywords: Romanization, Expansionism, Integration, Society, Aristocracy

Introduction

The process of Roman expansion into Etruria unfolded over a rather long span of time. The economic and social development of Tyrrhenian Italy during the eighth century, which presupposes the rise and consolidation of private land ownership, resulted in major social schisms with the birth of powerful aristocracies that exercised politico-military power and were distinct from the remainder of the population, with significant inequality in economic status. The Rome of the monarchy and of the early republic appears similar in its internal characteristics to the situation of many other communities in the Tuscany-Latium region.¹⁹²²

1The reasons for Roman expansionism

Setting aside the political repercussions of the expulsion of the Tarquins at the end of the monarchic period (late sixth century) that resulted in the temporary several-decade halt of Roman expansion, the Roman expansionism basically has to be considered the result of two parallel and complementary phenomena—namely, internal social tension and demographic pressure. In other words, the need for Rome to find new lands for its own citizens is at base a colonialist phenomenon of increasing relevance, with ever-increasing political and territorial implications.¹⁹²³

We must take into account the way the distribution of land in the new colonies and in *virgatae* (individual) allocations was managed and how, even in the fifth century, the poorer section of the Roman population benefited from territorial expansion. It is obvious that in the first decades of the Roman Republic there was a demographic problem that they tried to resolve in various ways.

It must be recalled that there were fundamentally two phases of the colonialist phenomenon. The first, which dates back to the period from the late monarchic age to the early republic, is difficult to reconstruct because its features are lost in an annal-istic tradition that is too greatly colored by subsequent events. What seems certain is that this colonialist enterprise unfolded at the initiative of family groups led by individual “condottieri”. The case of Satricum is exemplary. We are in a period marked by widespread horizontal social mobility throughout the Tyrrhenian region and is well exemplified by Lucumo who moved from Tarquinia to Rome, where he assumed the name Tarquinius.¹⁹²⁴ Meanwhile, Etruscan expansion into Campania culminated in the siege of Cumae in 525 BCE. The final act was an episode that was to profoundly alter Etruscan history in the fifth century and, therefore, the history of all of south-central Italy, namely the naval battle fought in the waters off Cumae in 474. Hiero I of Syracuse, allied with Aristodemus, the tyrant of Cumae, after he was called for military assistance, met and defeated the Etruscan fleet. In an amazing coincidence, not so unusual in the ancient historiographic tradition, the annalist reports that in the same year a truce was declared between Veii and Rome after a conflict that had lasted a decade. The Etruscan defeat at Cumae had repercussions for the general political equilibrium.

On the one hand, the Etruscan ports on the Tyrrhenian Sea saw a clear decrease in their commercial activities as a result of the huge drop in importation of Attic pottery. On the other, it promoted the development of the Adriatic trading centers of Atria and Spina that functioned as the ports of entry for such imports.

2The stages of Roman expansion

To understand the stages and methods of Roman expansion, it is absolutely necessary to keep in mind the complexity of the situation in Latium between Etruscans and Latins. Also relevant are the Faliscans, an ethnic group who spoke a language closely related to Latin, and the Capenates. The *Ager Faliscus* (Faliscan territory), bounded on the east by the Tiber and on the west by the Cimini Hills, is encompassed by the basin of the Treja, a right-bank tributary of the Tiber, and is dominated by Monte Soratte. Capena, on the other hand, is little more than an enclave resulting from the penetration of groups speaking the Sabine language who crept into a little loop of the Tiber south of Monte Soratte. These were groups of people who played a role in the increasing Roman control of both banks of the river. The first significant step was the subjugation of Fidene, which was situated on the Etruscan bank of the Tiber. The conquest of this site, which probably happened in 435 (or 416), had results of fundamental importance for trade along the river and for the struggles that arose with the Etruscan city of Veii. It turned out to be a situation of great instability and more or less perpetual conflict that would come to involve the entire region. In the ten-year war between Rome and Veii (405–396), the Capenates as well as the Faliscans sided with the Veientes. The turning-point came in 396 when, at the end of a long siege, Veii was stormed by Rome and its territory was subdivided for Roman colonists into lots of uncertain dimensions. These are the circumstances in which four new territorial tribes were created at Rome with virginal land distribution.

The conquest of Veii, with its echoes of the Trojan epic, signals an undeniable qualitative leap in the initial phases of Roman imperialism, when the territory controlled by Rome encompassed an area approximately equal to that of all the rest of the Latin-speaking community.

Between the fourth and the early third centuries, the middle Tiber Valley became part of Roman territory. The conquest of Veii was followed successively by those of Capena the next year, of Nepi and Sutri between 390 and 389, of the entire Sabine territory at the beginning of the third century, and finally, of Falerii Veteres in 241, which was then rebuilt elsewhere as Falerii Novi. This was a gradual process—it took about a century and a half—whose methods and various stages cannot easily be reconstructed with sufficient precision. As it has been suggested, the Roman expansionist thrust seems to have been caused and promoted by internal crises, especially of a social nature, in the fifth century. The conquest of Veii in fact tripled the area of Roman territory and provided a resolution of the need to find lands for the plebeians.

Let us recall that, during the fourth century, as far as can be determined from the results of the Tiber Valley Project conducted by the British School at Rome, the area of the Tiber appears to be void of occupation.¹⁹²⁵ Notwithstanding the creation of four new tribes and the concession of lands to non-citizens, the archaeological evidence does not permit us to determine the extent of this occupation, although the settlements become more visible

between the end of the fourth and the first half of the third century. Capena, for example, having surrendered to Rome in 395, continued to be a site of modest size with a good part of its territory used as *ager publicus*. Its exclusion from the network of the main lines of communication restricted its function to one of meeting the needs of the small rural villages that had developed nearby. Much more dramatic, however, was the case of Falerii, which after a series of rebellions, in 241 provoked a severe Roman intervention that led to the destruction of the city. Half the territory was ceded to the conquerors while the surviving inhabitants were deported to a flat area that was difficult to defend, where Falerii Novi was founded.

In general, all the *agri* now have most of their settlers in sites occupied for the first time, in locations different from those previously occupied. The number of settlers who continued from the Archaic period, the sole exception being the Capena area, seems to be greatly reduced. As for the mid-republican sites, they were all newly founded, which reflects the fact that some of the territory was only reclaimed from the Cimina forest toward the middle of the third century. As for the Sabine territory, the indications of new settlement almost quadruple. Here occupation of the territory took the form of virthane allocations. Roman expansion into Etruria was in reality anything but linear. In 358 there was an attempt by Tarquinia to stop it that was supported by its allies the Faliscans and the Caerites. This sort of reaction to the increasing Roman pressure, after some initial success, produced no significant results. In 351 Caere left the alliance and negotiated a forty-year truce.

The decisive moment in the progress of Roman expansion into Etruria seems to have been the conquest of Vulci in 280. The hostility between the Etruscans, who probably acted as a league, and Rome recommenced in 311,¹⁹²⁶ when the initiative was taken by the cities of central Etruria, who reacted to the increasing Roman pressure. Hostilities began with an attack on Sutri carried out by all the Etruscan cities of central Etruria except for Arretium. This first phase of the war ended in 307 with a separate truce with Tarquinia and a substantial Etruscan defeat. The outcome of this conflict favored the further expansion of Rome into the central Tiber Valley and Umbria, where in 299 the Latin colony of Narnia was founded. This emergency persuaded the Etruscans to ally with the traditional enemies of Rome, the Samnites and Gauls, a coalition that was routed by Rome in the battle of Sentino in 295. From this moment on, the cities were annexed one by one. The last to submit was Caere in 273.

As for Vulci, the complexity of the Roman conquest on the cultural level—and of its difficulties—seems to be indicated by the cycle of frescoes preserved in the Fran-çois Tomb (late fourth century). The degree of conceptual and artistic elaboration of the paintings implies a high degree of ideological commitment on the part of the client. There is a great theme, or rather a powerful recollection, that appears to be deduced from the contrasting scenes on the two sides of the tomb that portray on one side episodes from

Greek mythology—specifically, the Thebaid—and on the other episodes from the recent history of Vulci and Etruria. They deal with disunity, and its consequences, exemplified in the highly effective scene of the murder-suicide of Eteocles and Polynices. But it is also legitimate to extrapolate¹⁹²⁷ an appeal for harmony, as is evinced by the scene in which Achilles and Agamemnon, now reconciled, preside over the sacrifice of the Trojan captives. In parallel, the fight scenes of many eminent Vulcentes with representatives of other Etruscan cities do not appear to refer to a specific individual event so much as to evoke in brief the emotion of a war lost.¹⁹²⁸ In particular, the heroic moment shown in the picture representing the liberation of Caile Vipienas by Macstarna seems intended to portray a glorious epoch now almost entirely past. The total message entrusted to the frescoes is that fighting an enemy (the Trojans for the Greeks, the Romans for the Etruscans) requires internal harmony. If this is true, the original juxtaposition of myth and history would be a hard-won and lofty reflection on the part of the Etruscans of their identity at the moment when they realized that they were put at risk of subjection to an external power. It is obvious what problems such a level of ideological elaboration would pose for Romanization.

The final moment of Etruria's subjugation to Rome is considered to be the siege and consequent destruction of Volsinii in 265 with the *evocatio*, the appropriation by Rome with its transfer into the city of Vertumna/Vertumnus of the patron god of the league of Etruscan peoples, which was dissolved once and for all.

3'Romanization'

The growing expansionism of Rome in Italy also presupposes an ensemble of legal relationships that must be kept in mind. It is true that such relationships, analyzed in the abstract, are insufficient to account for the complexities of the phenomenon that brought Rome to its hegemonic position.

The first case to be recorded is the destruction of Falerii, which demonstrated harsh treatment almost without parallel (save for Volsinii), and which can be explained as the need to make an example when Rome emerged victorious from the First Punic War. In general, in fact, the Roman policy in Etruria seems to have been to respect the extant situation, seeking cooperation from the local aristocracy. It is true that archaeological investigation documents the reality that Rome's arrival in a territory signaled a total reorganization with major resulting changes for the population. There is no doubt that the colony of Cosa evidences features of marked aggression that imply the expulsion of the resident population. In the years immediately following, between 264 and 245, Rome founded at least three maritime colonies—Pyrgi, Castrum Novum, and Alsium, and, in Caerete territory,

Fregenae (Fregene)—along the coast, in the territory of Vulci, directly south of Cosa.

Actually, Roman policy toward Etruria was anything but homogeneous: it exhibits a variety of approaches that probably reflect considerations of various socioeconomic as well as territorial conditions. In the north, Roman victory generally involved the imposition of a sizeable financial penalty on the defeated community, with the consequent reinforcement of the dominant oligarchy; in the south, however, extensive cessions of territory by the defeated community followed successful conquest.

Among the peculiar legal instruments that Rome used was that known as *civitas sine suffragio*. The origins of this peculiar institution are anything but clear. One possibility is that it was originally designed as a privilege of specific individuals in specific localities of residence in Rome who might exercise certain activities in a state of guardianship, somewhat like the metic (*metoikos*, resident alien) in Athens. Although not a proven hypothesis, it is a common opinion that Caere was the first city on which *civitas sine suffragio* was conferred.¹⁹²⁹ According to Livy (5.50.3), on the occasion of the capture of Rome by the Gauls, Lucius Albinus had the Vestals, the priests, and the *sacra* transported to Caere on a wagon; and the Caeretes supposedly offered their hospitality. In exchange for this support, the Romans had conceded to the inhabitants of Caere *civitas sine suffragio*, putting this institution into practice for the first time. Its introduction in the middle of the conflict with the Samnites, and thus with the Latins, makes it difficult to understand fully the terms of its application and its real purpose.

Rome resorted frequently to the institution of the *civitas sine suffragio* from 338 until the middle of the second century, but after that it was gradually abandoned. It is possible that the communities that had entered into the Roman orbit accepted this policy because Rome might have allowed these communities to maintain internal autonomy. In any event, perhaps by reason of the difficulty represented by the rapid incorporation of new territories, Rome abandoned the use of *civitas sine suffragio* in favor of treaties (Lat. *foedera*), which were probably considered an effective instrument, by reason of their greater flexibility, for organizing a conquest. The various types of *foedera* known to us suggest a realistic approach to the variety of local realities. The *foedera* called *aequa* allowed a community considerable freedom of political action. Other *foedera* contained much more restrictive clauses (the term *iniquum* for such types of *foedera* does not seem to be Roman) that generally included the obligation to provide military contingents. Essentially, this community was deprived of any form of autonomy in external relations. With respect to Etruria in the wider sense, we have explicit mention of only one *foedus*, that with Falerii. This absence of documentation might, however, be explained by the gap in Livy's text for a period corresponding to that in which many *foedera* could have been drawn up.

It is usually thought that Roman policy in Etruria respected existing

conditions and was the reason for the solid social fabric that was in force in the different city-states. It may be imagined that Rome was aware of the difficulties that would have accompanied a process of assimilation that would call into question the consolidated balance.

The treatment reserved for Vulci in 281 deserves attention. Vulci was quite large (ca. 2,000 km²) and at least half was confiscated. Rome's interventions in it are evidence of a very specific plan that presupposes a radical administrative reorganization of the conquered territory with the foundation of colonies in strategic locations and the systematic design of a road network (see [section 8](#) The progress of Romanization, below).

4The colonial foundations

Among the colonial foundations, Cosa has special significance. Its primarily strategic value seems obvious—that is, military control over the territory of this colony. Cosa was founded at the same time as Paestum in 273 as a result of the victory of Tiberius Coruncanius over the Etruscans of Vulci and Volsinii. The Romans had taken from Vulci the coastal strip similar to what had been done with Tarquinia, in whose territory the Latin colony of Gravisca had been placed. The confiscated lands were in part incorporated into the *ager Romanus* and in part left to autonomous administration by the colony under Latin law. This would have to oversee a wide territory (ca. 550 km²) that included the promontory of Orbetello up to twenty kilometers inland.¹⁹³⁰

The principal military purpose—progressive restraint of the hostile population, which in the case of Cosa seems undeniable—must not lead to the undervaluation of the demographic significance of Latin colonization and its effects on the evolution of Roman society during the third and second centuries. The data available to us are striking. Rome's use of colonies of the Latin type, such as Cosa, which imply the participation of groups of a large number of colonists (at least 2,500, whereas the colonies *civium Romanorum* count no more than 300 colonists), turns out over a long period to be an instrument particularly adapted to involve extensive social groups in colonial policy.

The founding of a colony with Latin rights, in fact, brought into existence a community that was formally autonomous, without involving an expansion of Roman territory. Such a community served nonetheless a basic need of Rome, which was military, in so far as it was obliged to furnish contingents of troops. The colonization process had various results of considerable importance to the beginnings of urbanization that were particularly significant where earlier settlement had been widely scattered. Cosa, an example of an “intermittent town”¹⁹³¹ characterized by quite distinct phases of settlement and episodes of abandonment and revival, represents an especially interesting case because it

seems to reveal a complex strategic design over a long period for the control and exploitation of areas of great military and economic interest. At this site there was probably an original Etruscan settlement of modest size. It now seems clear from recent excavations that the urban fabric of Cosa did not immediately increase upon the initial founding in 273, but only upon the second founding by a further 1,000 colonists in 197. As we know from Livy, the colonists were chosen from the allies of Rome in the Second Punic War and were probably veterans. The Cosa countryside saw a considerable increase in density of settlement, with small houses built especially in favored areas like the Oro Valley, which also holds for the construction of the Via Aurelia.

Cosa reproduced a situation like that of other colonies founded after the Second Punic War. Aquileia, the last Latin colony founded in an especially difficult environment in 181, presents significant similarities. Here too, the lots assigned to the colonists were differentiated according to rank: a tripartition that would certainly guarantee social and political priority to the representatives of the upper classes. Aquileia, like Cosa, also received a boost of colonists a decade or so after the initial founding.¹⁹³²

It must also be noted that at the beginning of the third century, when Sabina was definitively conquered by Manius Curius Dentatus, the new territory would experience a new system. Aside from what was left to the inhabitants who had had the status of *cives sine suffragio* the public land was in part assigned by virittane concessions to the plebeians or else granted, by means of quaestorian sale—thus in permanent and hereditary possession (a sort of emphyteusis)—to representatives of privileged classes. The conquest of Sabina in fact paved the way for Rome to control the Adriatic by precluding the possibility of a uniting of Etruscans and Samnites.

Rome's victory over Vulci also marks the beginning of Rome's penetration into the interior along the Albegna and Flora Valleys. Rome founded the colony of Saturnia in the upper Albegna Valley in 183, which is a difficult decision to explain.¹⁹³³ The military explanation is unsatisfactory because, while it is true that the site was, as it proved, readily defensible, it is not clear why it might have considered vulnerable, in as much as it lay far from the coast. Saturnia, along with Parma and Mutina (Modena), which were founded in the same year, was the first colony situated far from the coast to have Roman status, so that the colonists had full Roman rather than Latin rights. It is thus likely that it had received a number of colonists greater than was standard for Roman colonies, perhaps 2,000, just like Parma and Mutina. Cosa is a settlement of the old type of rectangular formation.¹⁹³⁴ Saturnia, on the contrary, was divided into squares canonic for the centuria. In general, these developments marked a radical change in the organization of the territory, which knew no significant settlement up to the third century, from which time the process of urbanization began.

The scale of Saturnia's colonial foundation is unknown, but its territorial

extent seems suited to have received 2,000 colonists with their families, through a complex organization of centuriated land equal to about 50 km². The regular distribution of the villas in an area of centuriated territory leaves open the possibility that such estates were already foreseen in the initial plan for the colony, and thus the prerogative of a privileged class, who perhaps was encouraged to settle by reason of advantageous conditions.

As for the founding of the colony of Heba (Magliano), which was a decisive event for the economic development of the lower Albegna Valley, we cannot be sure of the date. Its foundation marks the end of the reorganization of the Vulci countryside, and it is a reasonable hypothesis that it occurred around the middle of the second century, although the lack of Livy's text for the years 167–133 deprives us of reliable information on the colonizations of this period. It is significant that archaeological investigation has brought to light some of the characteristics of the organization of the territory that was very like that of Saturnia. In particular at Heba, as at Saturnia, allocations have been shown to have differed according to location. In both colonies there was a need for non-marginal fertile land that could be acquired easily. In fact the colonial settlement was situated in thinly populated areas, perhaps because of the development of urban settlements such as that known today as Doganella.¹⁹³⁵ Such areas were therefore suitable for agricultural exploitation. This is thus a secondary, mature phase of Romanization, involving the organization of territory following its acquisition and military occupation.

5The network of roads

Increased Roman control of former Etruscan territory determined the development of a significant network of roads that was built between the second half of the third and the second centuries. The most important of all had to be the Via Aurelia (called *vetus* to distinguish it from the later one called *nova*). Its construction is usually attributed, albeit without definite proof, to L. Aurelius Cotta on the occasion of his censor-ship in 241. This was the first axial road constructed along the coast of Etruria that obviously functioned to control territory, as it avoided—and thus marginalized—the ancient Etruscan centers. One of the purposes of a road with these features had to be to permit rapid travel by the armies in anticipation of military operations toward the north and, in particular, against the Ligurians. It is uncertain whether its initial layout reached as far as Pisa. As for Saturnia, its placement toward the interior made the simultaneous creation of a road network that put it in rapid communication with the coast absolutely necessary.

It is above all the Via Clodia, in a way the “most interesting road in the region,”¹⁹³⁶ that discloses an essential function of connecting road. Built

between the Via Cassia and the Via Aurelia, at a date probably close to that of the founding of Saturnia, in either 171 or 154, it was never one of the principal roads to northern Etruria or beyond. While the two major roads were planned principally as axial roads for long-distance travel and thus avoid localities close to their route, the Via Clodia connects Rome with places in southern Etruria. Thus, its purpose was primarily commercial. The side roads that connect with the sea branched off from it. At Heba it constitutes the principal decuman of the colony. This sort of arterial road has implications that go beyond the mere control of territory. A road like the Via Clodia, without clear military aims and with commercial purposes, on the one hand presupposes permanent settlement with intense exploitation of the resources of the territory and, on the other, has major consequences for the local populations. Romanization can therefore be considered an indirect outcome of pacification and political reorganization.

6Northern Etruria

We turn now to the relationships between Rome and the cities of northern Etruria, which lie more in the interior of the region. The case of Arretium (Arezzo) is revealing: the modern city rises on the same spot as the Etruscan and Roman ones, but the name that is preserved, of uncertain etymology, is the Latin one. Its Etruscan name is unknown. The siting of the city has no other advantage than location at the junction of natural connections in many directions and with the Apennine passes. The Arretine plain and the Chiana Valley immediately to the south are naturally devoted to agriculture, and the grain production and viticulture of these areas were already appreciated in antiquity. The relations of Arretium with Rome from the beginning were formulated in terms of substantial cooperation after a brief phase of confrontation. Already in 311 the Arretines are the only ones who do not participate in the war against Rome promoted by the peoples of Etruria. From Livy we know that at the beginning of the third century, after suffering a defeat, Arretium together with other Etruscan cities undertook to furnish Rome with clothing and wheat to be able to negotiate a forty-year truce. A series of indications indirectly suggest that the occasions of confrontation reflect questions of internal social conflict. The dominant aristocratic government in Arretium was interested in maintaining good relations with Rome while most of the population was anti-Roman.¹⁹³⁷ In any event, beginning in the middle of the third century, Arretium appears to be linked with Rome by a treaty of alliance.

Still more significant is the role of the city in the decisive years of the Second Punic War. Despite Hannibal's presence in the region, the Arretines did not temper their attitude of loyalty toward Rome. In the record of the

contributions of various Etruscan cities to the expedition of Publius Cornelius Scipio against Hannibal in Africa in 205, the role of Arretium appears particularly important: besides arms, it furnished in fact 120,000 *modii* of wheat, the provisioning for commanders and oarsmen during the voyage, and moreover a considerable variety of farming tools (Livy 28.45.16–17). The territory of Arretium seems to have been untouched by land distribution in the period of the Gracchi. Therefore, when Arretium was transformed into a *municipium* and became part of the Roman State in 90 and its citizens acquired full citizenship, an era of peaceful involvement of the Etruscan city in Rome's sphere of interest reached its logical conclusion.

Let us consider how after the Second Punic War there are no known Roman colonies in Etruscan territory, with the sole exceptions being Lucca (Latin colony founded around 178) and Luni (Roman colony founded in 177), which were founded moreover in rather marginal areas. Saturnia, included by the grammarian Festus in a list of prefectures,¹⁹³⁸ which probably presupposes a level with precedence over colony, appears to be a special case. The same considerations also hold for the colony of Heba. If this is the case, then we must assess very carefully how significant was the process of Romanization in the Etruscan area. Before Sulla, the only settlement of Roman citizens in the region is that of Statonia, a place identified today with the site of Pianmiano near Bomarzo.¹⁹³⁹ The date of founding is also uncertain. The fact that Vitruvius mentions it as a prefecture leaves open the possibility that this area was populated by colonists with allocations obtained by individual title. In this case we must imagine a broad swath of territory between the lower Albegna Valley and Lake Bolsena as the object of a Roman settlement process on a vast scale. This is a choice that clearly goes beyond military territorial control pure and simple. But “Romanization,” however it is understood, even simply as the assimilation of Roman customs by the local population, was part of a policy of economic exploitation. The complicated work of road organization, as mentioned, must be considered an essential feature of this policy which enhanced the value of areas, such as the Albegna Valley, that can be cultivated profitably and that were lightly populated. This cannot be so if the *fora* known for Etruria are all located along the main roads, the Via Aurelia, the Via Clodia, and the Via Cassia.

7The organization of the territory

The founding of Cosa seems to be highly indicative of the two successive phases of Roman presence in Etruria. Founded as a sort of advance emplacement, perhaps at first in anticipation of successive offensive projections and then with the immediate military purpose of territorial control—a similar situation to that of Aquileia a little less than a century later, with

the colonial supplementation characteristic of many Latin colonies that underwent two successive phases of population—it seems to have served various purposes from the beginning. At this point Rome seems interested in choices of the economic type that were conveyed in more sizable colonial foundations. If the Latin type colony was about to be abandoned, those under Roman law were numerically important and began to be founded in the interior as well.

Let us add that one of the main consequences of the Second Punic War, of “Hannibal’s legacy,” which was fought in large part in central-southern Italy, was a demographic decline that affected not only Rome but several areas of the peninsula as well. While between the late monarchy and the early republican state the colonies had been thought of as a sort of solution for problems of population increase and the difficulty in supporting it, in the first decades of the second century Rome found itself needing to motivate new colonists to leave the capital with various economic incentives and legal protection. This explains, for example, the recourse to individual allocations of land. It is possible that the new settlers, who were frequently placed in poorly populated areas, would have tried to include the scattered local populations. These local populations would have become aware of the organizational superiority of the ruling power, which was capable of implementing good ways of life and of bringing with them wealth and efficient administration. It might be argued that a colony would have deprived the indigenous population of territory and that therefore its founding would have provoked resentment and conflict, but this is an argument that does not find support in our literary sources.

In Etruria, we do not have proof of a Roman punitive policy toward the local community. During the Second Punic War, the ruling classes in Rome, who were contemplating the prospect of overseas expansionism with the possibility of booty on a scale unimaginable in Italy, seem to have developed a preference for choices in which economic considerations appear to be decisive. It was a question of the consequences for cultural identity of military success and the pacification that followed.

This sort of reality provides an understanding of how the Romanization of Arretium, *mutatis mutandis* in other places in northern Etruria as well, such as Volterra, proceeded in a regular way, without breaches. A significant example accrues to the most famous figure in the history of Roman Arretium, namely Gaius Cilnius Maecenas, a minister of Augustus, who was a friend of Horace and a prominent figure in the cultural life of the late first century BCE. Maecenas was a member of the equestrian order but belonged to an aristocratic family. He had been a loyal legate of Caesar with a particularly close relationship to Octavian, which guaranteed solid ties of cooperation with the Roman government of his family.¹⁹⁴⁰

8The progress of Romanization

With regard to Roman expansionism in central Italy, Umbria presents an obvious comparison. Roman contacts intensified with Umbria during the conquest of the region that took place at approximately the same period as the definitive submission of Etruria (ca. 310–266). During the third century, Umbria saw the settlement of an estimated 40,000 colonists, which would imply that approximately a third of the population would have had Roman or Latin status.¹⁹⁴¹ So massive a presence of new residents inevitably entailed profound territorial reorganization: the lands taken from the Umbrian community would have to be centuriated. The very construction of an axial road of the importance of the Via Flaminia, built in 220, reflects the need to guarantee rapid access for long-distance traffic. Other roads, such as the Via Amerina, built in 240, which linked Ameria with Falerii Novi and Rome, served to facilitate local communication.

With respect to Romanization, it must always be kept in mind both that Umbrian material culture was never a particularly evident phenomenon and that the production of manufactured goods was always dependent on external factors. Before the Roman conquest, it was above all Etruria that exercised great influence over Umbria, in particular Volsinii. And the earliest Umbrian inscriptions, from the fourth and third centuries, used the Etruscan alphabet of Volsinii and Perusia (Perugia). This relative cultural weakness of the Umbrian world justifies the assumption that in this region the process of Romanization was faster than in Etruria.¹⁹⁴² This premise has been tested a number of times that have resulted in refining the question and placing the accent on other critical points. The diffusion of the Latin language and alphabet between the conquest and the Social War constitutes the most obvious indicator of Romanization. It is assumed that the use of Latin was the rule in the area populated by Romans and Latins, particularly in the central-southern part of the relevant region of viritalis distribution. It is true that those very epigraphic habits in Umbria presuppose the adoption of an external model, first Etruscan and then Roman, that caused the rapid acquisition of the alphabet and the language. The Iguvine Tablets are also consistent with this reconstruction (if it is true, as is generally held, that the part written in the Umbrian alphabet goes back to the beginning of the second century and that written in the Latin alphabet to the end).

The Iguvine Tablets themselves provide confirmation of what might summarily be considered an aspect of Romanization on an institutional level. The word *kvestur* appears in them twice, as well as the related *kvestretie*. And if, as seems possible, *kvestur* simply designates a position in a religious brotherhood and not a magistrate with jurisdictional responsibilities, it is highly probable that the word came to Iguvium (Gubbio) from Rome. It would thus be an Umbrian lexeme calqued on Latin *quaestor*; a phenomenon that can be explained as a sort of spontaneous adjustment to the constitutional

structure of Rome.¹⁹⁴³ Without parallel documentation or sure data, the hypothesis remains plausible that at a certain point in Iguvium it was used within a religious community, borrowing a term from Rome perhaps with the aim of ennobling its own traditions. In other words, this could be seen as an example of so-called “*Selbst-Romanisierung*” (“autoromanization”), implying knowledge and implicit acceptance of the internal organization of the ruling power. It also remains true that most of the words on the Iguvine Tablets apparently have neither an Etruscan nor a Roman origin.

9The regional differences

Our evaluation of the process of Romanization of Etruria received a special impulse from the results of the survey conducted in the Cecina Valley. The data collected demonstrate how Etruscan social and economic structures that had previously expanded here had been assimilated untraumatically into the new Roman reality. This process can be traced back to the role played by the local aristocracies in promoting Romanization. The very absence of villas, sporadic remains of which can be traced only along the coast, can serve as an indication of a process of continuity and of maintenance of traditional forms of agrarian exploitation. It remains difficult to establish the legal condition of the families who inhabited the farms of the area.¹⁹⁴⁴ Nor does the presence of a major urban center like Volterra seem to have been a factor in drastic Romanization, at least in the surrounding countryside.

As in similar cases, Romanization had clearly interested the city, which obtained Roman citizenship with the *Lex Julia* of 90 BCE. Volterra, in reality, seems to have enjoyed the status of *civitas foederata* at least from the end of the third century, when it contributed to the African expedition of Scipio Africanus. And in the same city it makes sense to evaluate elements that signal a composite reality, in which some emulative behaviors are proper only to the elite and not to the entire body politic.¹⁹⁴⁵

Here we may ask how representative this case would be with respect to the process of integration of Italy into Roman rule. What seems certain is that in this situation both the Romans and the local ruling class had to work towards a mutual understanding through realistic forms of cooperation. Naturally it is also legitimate to wonder whether the peculiarity of the situation of Volterra, whose conservatism is evidenced in the countryside, was not due to its frankly peripheral location and to limitation of interest on the part of the Romans to the intensive exploitation of the territory. But in any case a reasonable hypothesis is that there were areas in the now-Romanized territory in which traditional Etruscan social relations continued to be valid.

It is attractive to think that the text known as the “Prophecy of Vegoia,” which is usually dated to the time of the Social War (91–88 BCE), continued

to have value in a society in which the traditional social order was considered immutable and left out of consideration by the general political organization. It includes complicated references to cosmogonic myths connected to forms of agrarian management and to property boundaries. Cicero himself, advocating on behalf of the Volterrans in the matter of the danger of the confiscation of their territory, makes reference to the centuries-long stability of their forms of property. As consul in 63, Cicero boasted of having prevented the alienation of the confiscated Volterranean lands and the ruin of the proprietors that held them, thanks to his opposition to the agrarian laws proposed by the tribune Ser-vilius Rullus. The danger represented by the conquest and its consequences could have persuaded the more conservative representatives into a pronounced reversion, with religious connotations as well, to the traditional values of the society.¹⁹⁴⁶

This speech took on very special value with respect to the convulsive years of the Social War and its outcome. Northern Etruria during the war remained primarily neutral. Nonetheless, immediately afterward, Volterra sided with Marius, like many other cities in the region. This provoked the ire of Sulla, who harshly punished anyone who had been linked with the Marians. Volterra was besieged in 80 and after the defeat, suffered a limitation on rights of citizenship and loss of part of its territory, although it does not seem that the provision was really carried out. Neither were the proposals advanced in the following decades to proceed with land allocations. In 45 BCE, Caesar's attempt to settle his own veterans seems not to have had dramatic consequences for the city's territory (the possibility has been raised that groups of Etruscans from northern Etruria fled to Africa).¹⁹⁴⁷

In that case, we may ask what strategies, what political choices were offered to the Volterrans to protect their own social organization from the devastations that had threatened it? It is likely that in the city, the elite were able to play a role of mediation with the Roman power: in this sense the role of the Cecina family at the head of Volterran society seems to have been taken as emblematic of the role of the native aristocracy in guiding their community in periods of delicate transformation as well. The rule of Augustus signals a notable level of cooperation between aristocracies of northern Etruria and Rome, which has in the Arretine Maecenas its most representative figure. It is not possible to fix with certainty the moment in which Volterra acquired the title of Colonia (Julia?) Augusta.¹⁹⁴⁸ It is possible that the conferring of the status of Colonia Julia on Volterra was due neither to Octavian the triumvir nor to Octavian Augustus after 27, but already to Caesar in 45 when he confiscated and distributed a part of the Volterranean countryside. It was, in any case, a colonization with characteristics neither traumatic nor punitive, quite different from Sulla's.¹⁹⁴⁹ The similarity of the fortunes of Arretium and Volterra thus enables us to catch a glimpse of a Romanization process -whatever that word is taken to mean – which was successful.

10“Cultural bricolage”?

As for the phenomenon of Romanization in the latest period, the contribution of studies of material culture merits greater attention in an increasing tendency to appreciate the value of the single, individual case rather than a general, global phenomenon. This approach has had particular success in the formulation, due to Nicola Terrenato, of “cultural bricolage”.¹⁹⁵⁰ Terrenato defines “cultural bricolage” as a process in which preexisting cultural elements assume various functions and meanings in the new context represented by Roman rule. In this process there is not a preordained model of Romanization in the sense that the local factors are a decisive component as much of the process as of its outcome. It is a way of attempting to avoid the Augustan ideology of *tota Italia* that presupposes the result of a process lasting several centuries that led to a substantial uniformization of settlement and economic forms and, therefore, of identity. If so, it is an attempt to recover the complex mosaic of pre-Roman Italy.¹⁹⁵¹

The theme of Romanization is undoubtedly a central but problematic and difficult one for any scholar who works on Roman Italy or the Roman provinces. It is a concept the nature of which is disputed; the fact that it is often approached from a political and cultural angle makes it difficult to study it objectively.¹⁹⁵² It is also a theme that has to be regularly revisited, as every new generation of researchers strives to arrive at a consistent definition and to create a methodology adequate for the study of this form of cultural change. It is no accident that recent research has studied the problem primarily from a regional perspective, and attempted to run synthetic and comparative approaches side by side.¹⁹⁵³

Roman Ernst Roth has recently taken an original approach to the problem of Romanization.¹⁹⁵⁴ Roth maintains that pottery can be used like a documentary source for the social history of the ancient world, especially with reference to persons who did not form part of the upper classes. In particular Roth examines the black-glazed pottery of two sites in central Italy, Volterra and Capena, to demonstrate that the apparent homogeneity of Roman Italy presupposed different responses to the process of Romanization at elite and non-elite levels of Italic society. This project, which can surely only be described as ‘cultural bricolage’, applies sociological theory to the study of material remains for the purposes of social history and specifically to bring into focus groups that are underrepresented in the documentary sources. In Roth’s reconstruction, the diffusion of pottery of low quality is explained with reference to a combination of innovation and tradition. This development implies the involvement of broad social classes and an accompanying improvement in living conditions overall.

Ultimately, recourse to the concept of Romanization appears to be justified because, notwithstanding the connotations of colonialism with which it is associated, it is still the most value-free way of illuminating the process in

question.¹⁹⁵⁵ In any case, in the light of current research, it remains to be clarified how far the process or result of Romanization was uniform; what role was played by members of the social elite; and the level of competition in the adoption of Roman practices, military service not considered.¹⁹⁵⁶

38The Etruscan Legacy

Abstract: From the 3rd cent. BC onwards the structure of Etruscan society was undergoing drastic changes. The destabilization of the ancient social structure involved progressive decay of the national culture through a process to which a variety of factors contributed. After the Roman conquest the glorious Etruscan past was used to reach not only collective, but also familial ambitions. Finally *etruscan Disciplina* become a powerful vehicle of the Etruscan legacy in the Roman world.

Keywords: romanization, Etruscan culture, *disciplina Etrusca*, Etruscan onomastic

1Prologue: The disintegration of the social organization of Etruria at the end of the Roman republic

The *Bellum Marsicum* (the Social War, 91–88 BCE) took a very short time to disrupt the entire structure of Italy that had been established nearly two centuries earlier on the eve of the Punic War, a structure that had only marginally been modified a few years later with the punishment inflicted on those *socii Italici* who had defected on the occasion of Hannibal's Italian adventure.¹⁹⁵⁷ Despite suffering the heavy impact of the Roman imperialistic push at the beginning of the grand conquest of the peninsula, in the decades straddling the fourth and third centuries, when the cities of southern Etruria suffered the loss of considerable portions of their territory, the Etruscans in fact remained loyal to Rome both during the Second Punic War and through the Social War. The results of this policy of loyalty led to the censors of 86 BCE, after the outbreak of the war and the granting of Roman citizenship to the Italics, assigning almost the entire community of Etruria to the “ethnic Etruscan” tribes, namely to those tribes created on the right bank of the Tiber in the year 388 after the conquest of Veii (Fig. 38.1).¹⁹⁵⁸ Aside from the “antiquarian” aspect of the operation, as if there was a desire to foster the preservation of the territories once possessed by the individual major cities, the choice shows a desire to grant to the Etruscans the privilege of enrolling in tribes considered favorable by the limited number of citizens registered in them.¹⁹⁵⁹

Fig. 38.1: Distribution of the Roman rural tribes in Etruria

But appearances can be deceiving. In the two centuries before the granting of the *optimum ius*, the structure of Etruscan society in the southern cities was

undergoing drastic changes. These began in the fourth century with the gradual passing of a system of production relationships that was based on the control of land and on the absolute economic and political domination of a limited governing oligarchy of *principes* over *servitus* (as the sources call the ancient form of dependency).¹⁹⁶⁰ During the third century similar structural changes took place in the northern cities as well, as a result of the integration—certainly in different ways from city to city¹⁹⁶¹—of the former *servi*, who would have received not only civil rights, but land grants. This picture derives from the onomastics of the cities of Clusium and Perusia, for which in his classic work on Etruscan cognomens Helmut Rix reconstructed the process of enfranchisement of the *servi* on the basis of the phenomenon known as the *Vorna-mengentile*.¹⁹⁶² The social ascent of these former *servi* is documented by many signs, both archaeological and epigraphic. The clearest archaeological evidence consists of the tomb of the *Cutu* at Perugia, built by *Arnth Cai Cutu*. He is easily identifiable as a former *servus* by his *Vornamengentile Cai* (later generations, to conceal his humble origins, preferred to use his *cognomen Cutu* as their family name); for his own urn *Arnth Cai Cutu* used the same workshop that had furnished urns for the aristocratic Tomb of the *Volumnii*.¹⁹⁶³ As for the epigraphy, the most significant text is the *Tabula Cortonensis*, a transcription on bronze of the proceedings of a land sale between the noble family of the *Cusu* and *Petru Scêvas*, a man of servile origins (Fig. 38.2).¹⁹⁶⁴ *Petru Scêvas* sold good lands near the Trasimeno for a rather modest price; his true reward was his family's improved social status by his daughter's marriage to a member of the *Cusu gens*, documented by the inscription of the latter¹⁹⁶⁵ on an urn placed in the prestigious Hellenistic tomb of the *Cusu* at Cortona, known as the "Tanella di Pitagora."¹⁹⁶⁶

The destabilization of the ancient social structure involved progressive decay of the national culture through a process to which a variety of factors contributed. Most important is the loss of the social certainties that had characterized the period of growth from the eighth century to the sixth. An attentive reading of the contemporary culture shows how little survived of the culture of the elite, which had been embellished in the preceding centuries by the early aristocracy, especially under the influence of the culture of the Greeks. Also contributing to the erosion of traditional culture were sizable numbers of people who had originated as slaves, quite aside from those provoked by the socioeconomic pressure exercised on a grand scale by Rome with its rapid development of the second century slave economy.¹⁹⁶⁷ This economy substantially bypassed Etruria, as is shown by the fact that among the *nomina* of the Italic *mercatores* of Delos, not even one reveals Etruscan origins.¹⁹⁶⁸

Fig. 38.2: The *Tabula Cortonensis* (after Nicosia-Agostiniani 2000, pl. 8)

CGENVCIOTLOVSINO·PRAI

Fig. 38.3: Inscription mentioning C. Genucius Clepsina in the underground building at Caere (after Torelli 2000, fig. 14)

The cultural and political decline of the *principes* was accompanied by a thinning of the number of *gentes* that formed the *nobilitas* of the Etruscan cities. The demographic decline and the cancer of *oliganthropia*—the shortage of men—which invariably characterizes oligarchic societies, drastically reduced the ranks of the local aristocratic elite, not to mention the fact that some of these *gentes* had emigrated early to Rome, a phenomenon of limited extent and largely confined to the period between the late fourth and early third centuries. This was the moment of maximum openness for the Roman *nobilitas*, when some aristocratic Etruscan families succeeded in entering into the ruling classes of Rome.¹⁹⁶⁹ The attested cases are those of the Perusine L. Volumnius Flamma Violens *cos.* 307, II 296, who traced his origins to the Perusine *Velimnas*;¹⁹⁷⁰ the two brothers C. Genucius Clepsina *cos.* I 276, II 270 and L. Genucius Clepsina *cos.* 271, descendants of the Tarquinian family of the *Clevsinas*, who entered the Roman *nobilitas* thanks to an alliance by marriage with the plebeian Genucii (Fig. 38.3); and another pair of brothers, Q. Ogulnius Gallus *cos.* 269 and Cn. Ogulnius *tr. pl.* 300, originally from Volsinii, where one *Uclnas* is apparently paired as a magistrate (or *haruspex*) with a member of the local aristocratic family the *Hesc(a)nas*.¹⁹⁷¹

But the most relevant phenomenon of cultural interference took place in the territories of Etruscan cities. The presence of colonies under either Latin or Roman law, and especially with large numbers of Roman citizens *viritim* in the territories confiscated from the Etruscan cities after their submission, was highly disruptive. Here the viritane colonists, organized both in *fora* and in prefectures, lived shoulder to shoulder with the original inhabitants of the city. Added in as well was the continuous infiltration of Latin elements within many formally independent Etruscan cities, who entered very diverse social positions alongside them. Well documented is the presence in Etruscan cities of families of certain Roman origin, who even possessed family tombs in the heart of Etruscan cities. One such example is the *Clavtie* family, who owned a late fourth century hypogeum at Caere (Fig. 38.4). A member of the family was married to another Latin woman named *Luvcli*, Etruscanized forms of the genuine Latin *nomina* Claudius and Lucilius.¹⁹⁷² There were also some individuals who were not necessarily residents, but who were active on the social level, such as the probable *mercator* T. Gavio(s) C. f.,¹⁹⁷³ who dedicated in Latin a vase in the merchant sanctuary of Gravisca, port of Tarquinia, shortly before the Roman conquest of 281 (Fig. 38.5).

The social composition of the Etruscan city between the submission and entry into Roman citizenship thus underwent profound changes. From a recent investigation of the onomastics of Tarquinia,¹⁹⁷⁴ it was possible to

demonstrate that of the forty-five Etruscan *nomina* of Tarquinian origin documented on *cippi*, which are considered the typical expression of the middle classes from the third to first centuries, thirty (or 75 percent) originated from freedmen or clients of families of the *nobilitas* of the fourth-third centuries. This seems to demonstrate the weight exercised on the social body of the families of the *nobilitas* after the submission to Rome, a period represented precisely by the *cippi*. But by all evidence this is a phenomenon that is primarily, if not exclusively, onomastic and not social in nature. The modesty of the *cippi* contrasts strongly with the forms of self-representation (painted tombs, monumental sarcophagi), that distinguished *nobiles* of the fourth and third centuries and whose *nomen* are handed down on these *cippi*.

Fig. 38.5: Graffito from Gravisca mentioning *T.Gavio(s) C.f.* (after Valentini 1993, pl. 47)

The epigraphic and archaeological materials from Tarquinia appear to be unique in many respects. If we had equally rich diagnostic documentation on the demographic level for other Etruscan cities, especially in the south, we would observe that this rapid disappearance of the aristocratic classes affects all of Etruria, a phenomenon that occurred first in the south. All this speaks to a large-scale turnover among the classes, with the emergence of groups linked to the local *nobilitas* only through onomastics—descendants of freedmen, *clientes*, or assimilated relatives ones—at the beginning of a huge turnover between the outstanding *gentes* of the local society, which very closely resembles the turnover brought to light by Keith Hopkins for the ruling Roman-republican groups.¹⁹⁷⁵ In other words, the ruling classes of the Etruscan *poleis* between the third and second centuries appear to be the victims of an impoverishment that was demographic but also economic, social, and cultural. This impoverishment, which emerged visibly and

macroscopically—both in the increasingly meager works of public or sacred building and in the evermore mediocre standard of everyday production by craftsmen—in the case of the major arts, is proof of the disappearance of a large artisan upper class.¹⁹⁷⁶

After the transformation of the population that took place in the wake of the submission, the second moment of profound transformation in the socioeconomic reality of the Etruscan cities coincides with the period that precedes and accompanies the turbulent Gracchian period. The beginning of the transformations can be perceived in the decades before the mid second century. First, new colonies (*civium Romano-rum*) were founded in various territories that had been conquered,¹⁹⁷⁷ like Saturnia, founded in 183 in the former Vulcian area, and Gravisca, created in 181 in the old port of Tarquinia. Then, again in the former Vulcian territory, the old prefecture of Heba was transformed into a colony (Statonia would have survived as a *praefectura*; Vitr. *De arch.* 2.7.3).

A few decades later, according to Plutarch (*Ti. Gracch.* 8), Tiberius Gracchus would have been moved to promote his agrarian reforms in view of the fields of Etruria that had become “populated by barbarians and slaves.” Even though it has been repeatedly denied, the presence of Gracchian colonization¹⁹⁷⁸ can be postulated both in Tarquinia¹⁹⁷⁹ and in Vulci¹⁹⁸⁰ on the basis of both written and archaeological indications; crucial indications come above all from onomastic data. The conclusion of this period¹⁹⁸¹ coincides with the unimaginable violence of the Civil War between Marius and Sulla and with the wars that emerged relating to the clashes between the various factions of the first and second triumvirates.

Etruria, which had been smoothly granted the citizenship *optimo iure*, was severely disrupted by banishments, private vendettas, and vast land distributions. We have literary and political echoes of these, from the so-called “Prophecy of the Nymph Vegoia,”¹⁹⁸² to the turbulence triggered by the *possessores Sullani*¹⁹⁸³ in the unstable climate in the countryside, which was infested with bandits and landowners’ armed militias.¹⁹⁸⁴ Signs of this social turbulence come to us from evidence that attests emigrations of Etruscans from their lands. One example is the girl who died in Egypt and was wrapped in bands taken from the well-known *liber linteus* of Zagreb, a sacred calendar apparently written in the area of Perusia.¹⁹⁸⁵ Another is the boundary stones with Etruscan writing marking divisions of fields in the valley of the Wadi Milian in Tunisia that belong to a community defining itself as “Dardani” (Etr. *Tartanium*). This community was led by *Marce Unata Zutas*, perhaps a former slave, as seems to be deduced from the possible *Vornamengentile* derived from the Greek Onatas (Fig. 38.6).¹⁹⁸⁶

Fig. 38.6: Boundary stone with Etruscan inscription from Wadi Milian, Tunisia (after Heurgon 1969b, fig. 3)

Only Perusia would remain unscathed by the violent transformations during these years, which occurred in every central-northern Etrurian city that had followed the *Marianae partes*. Even its fate was sealed, however, with the massacre of the local ruling classes, who were defeated in 40 BCE after Octavian's intense siege of the city, where the triumvir's brother L. Antonius and his wife Fulvia had sought refuge.¹⁹⁸⁷ The picture of the destruction of old Etruria appears complete to us. In nearly every old North-Etruscan capital, we know of first century colonists—from Sulla's (documented at Arretium, Volaterrae, Faesulae, and Clusium),¹⁹⁸⁸ to the triumvir's and Augustus's (known at Perusia, Rusellae, again at Volaterrae,¹⁹⁸⁹ and Arretium); we do not hear of the triumvirs' colonists in Populonia, Tarquinia, Cortona, or Caere. We are therefore able to conclude that at the end of the Civil War very little had survived of that most ancient *ethnos*, which, according to Cato,¹⁹⁹⁰ had

controlled all of Italy. To judge by the epigraphic evidence of the Etruscan language in the private, funerary sphere—it is in fact unthinkable that it could have been used publicly in a Roman political or legal context—it ceased to be used during the first century,¹⁹⁹¹ even though, as Santo Mazzarino has shown,¹⁹⁹² scraps of the ancient population must have existed, fragmented in the countryside, tenaciously sticking to the language and customs of the past, traces of which are still revealed in the agricultural lexicon preserved in the modern Tuscan dialect.¹⁹⁹³

2The legitimizing past: Collective ambitions

The extreme exiguity—we might even say absence—of traces of an authentic Etruscan aristocracy that could legitimately claim origins in the *nobilitas* of the fourth-third centuries is confirmed by the reduced number of recognizably Etruscan citizens who had access to the Roman senate from the last century of the republic to the first of the empire, and in the even more limited number of those who reached the consulship, mostly in the first century.¹⁹⁹⁴ After the success of the *Clevsina* family in the middle republican period, the first consul whose origin was certainly Tarquinian was L. Caesennius Sospes *cos. ord.* in 61CE. In other words, the true heritage, transmitted from Etruscan *principes* to real or supposed descendants who bore the names of those *principes*, was not the blood, but every Etrurian city's glorious past, including those repopulated in various Augustan colonial foundations¹⁹⁹⁵ or even those newly founded by Augustus himself, as in the case of Veii. Here, after the city *abiit in villas*¹⁹⁹⁶ in the second century BCE, the *princeps* reconstructed an urban simulacrum, the *municipium Augustum Veiens*.¹⁹⁹⁷

Even though they had been semi-depopulated or repopulated by Roman colonists, the cities of Etruria boasted great temples of antiquity, all of them still towering over the plazas, as at Tarquinia, Vulci, or Rusellae;¹⁹⁹⁸ or on acropolises, as at Populonia, Perugia, or Volaterrae.¹⁹⁹⁹ Those sacred edifices, sometimes restored even in the imperial age, were destined to survive until late antiquity. Each, by its very physical presence, would recall its extraordinarily glorious past, which was spoken of moreover by the ancient writers. This is what made the difference between the cities of Etruria and those of the rest of Italy, many of which had only become truly “urban” very recently, and none of which were in a position to boast a centuries-old history.

The very narration of these historic events or the description of ancient religious customs since the first half of the second century had, on the consolidated Hellenistic models, given rise to a robust antiquarian literature on the Etruscan historical and mythic story. This literature, which had fomented Etruria's national pride, interested intellectuals of various Italic origins who were active at Rome, such as Marcus Porcius Cato from

Tusculum²⁰⁰⁰ and Cassius Hemina, very likely of Etruscan origin.²⁰⁰¹ It also interested Etruscan men of letters who wrote local histories, such as Caecina from Volaterrae.²⁰⁰² As has been brought to light by Domenico Musti,²⁰⁰³ who analyzes the late republican historiographical debate on archaic Rome, we can even find historical reconstructions of philo-Etruscan and philo-Hellenic attitudes, which had the clear intent of interfering in contemporary politics. Marta Sordi has insisted instead on the connection between the myth of Troy and Rome's Etruscan heritage.²⁰⁰⁴

During Augustus's reign, according to the ancient Roman and Italic scholars Verrius Flaccus and Hyginus, the same antiquarian climate that had come into existence in the late republic and whose peak is occupied without peer by Varro, appears firmly inculcated in the imperial household. Through the capillary diffusion of the imperial cult, it came to constitute further stimulus for the Etruscan cities toward recovery of myths and local histories for the purpose of self-promotion. During the Julio-Claudian period it led the most eminent of the few Etruscan cities (namely Tarquinia, Caere, Volsini, which during the second-first centuries had remained unharmed or were no more than brushed by the drastic settlements of colonists— apart from the Gracchian ones) to exalt their own past, erecting monuments intended to celebrate those ancient glories. This particular aspect of the intertwining of imperial propaganda and the newly minted heritage of the most recent Roman colonizations emerges from the differences between Tarquinia and Arretium. Tarquinia was the heart of this widespread climate of Etruscan nostalgia. It not only revived the title of *civitas foederata* as a remembrance of the independent past and of the ancient *foedus* drawn up with Rome in 281, but became the theater, around the old main city temple popularly known in modern times as “Ara della Regina,” of a great production on the past glories of the city and its families. In contrast, at Arretium, which was home to *Arretini Veteres*, *Arretini Fidentiores*, and *Arretini Iulienses*—the old citizens of Etruscan Arretium, the Sullan colonists, and the Augustan colonists²⁰⁰⁵— as attested by the list in Pliny (*HN* 3.52), the past, as far as we can tell, was seen only as that of Rome. This is documented both by the altar with the Luperca²⁰⁰⁶ and by the small-scale “copies” of the Roman *elogia* of the Forum of Augustus.²⁰⁰⁷

Tarquinius erected a statue of the founder Tarchon, with an inscription of at least four lines, of which unfortunately only a small scrap survives. The first line contains the name and filiation of the hero, *[Tar]cho[n Tyrrhenif.]*, the second and third contain the memoir of the rule of the hero as founder of Etruria and of the city, while the fourth line was perhaps the record of the initial Etruscan expansion into Campania with the unknown city named Hama (Fig. 38.7).²⁰⁰⁸

Fig. 38.8: Roman relief from Caere, so called Throne of Claudius (after Fuchs 1989, p. 54)

Still more substantial evidence of the importance possessed in the imperial present by the memory of ancient glories is found in the so-called “throne of Claudius,” an illustrated monument found in a dump close to the theater of Caere together with a group of imperial statues with related inscriptions,

pertaining to a local *Cae-sareum*.²⁰⁰⁹ Only a single fragment of this monument has survived, from which we find it hard to reconstruct its appearance with any certainty (Fig. 38.8).²⁰¹⁰ The term “throne,” which is hardly consistent with the typology of such objects, was coined in an attempt to connect it with a colossal seated figure of the divinized Claudius found in the same context. The fragment of this unique monument consists of a heavy carved rectangular slab of marble, which on the front depicts the personifications of three Etruscan *populi* labeled with their names. On the wide outer border appears a vegetal motif of acanthus, while on the back, only partly worked, is the figure of a pig standing on a base in the form of an altar, behind which is a tree. This last scene has been described as a depiction of sacrifice, which is a trivialization, as the figure of an animal standing on a base is not at all consistent with a reasonable depiction of a sacrificial ritual. Instead, considering the presence of the tree, it may allude to a monument representing a local or national foundation myth, similar to that which arose around the legend of the Trojan origins of the Latins, based on the sow of Laurentum. The long carved side, broken toward the left, shows from left to right the personifications of the *Vetulonenses*, *[Vo]lcentani*, and *Tarquinienses*, of the *populi* of Vetulonia, Vulci and Tarquinia. The first is a heroic nude figure provided with an oar within a niche, whose left side shows a tree forming a wing; the second is a veiled goddess seated on the inscribed base holding a bird in her right hand; the third, also on an inscribed base, shows a man in a toga standing *velato capite*. These represent, patently, the founding hero of Vetulonia, the main goddess of Vulci and Tarchon, and the founder of Tarquinia. The main difficulty for the reconstruction of the monument is the obscure sequence of personifications, which according to Paolo Liverani is alphabetical, albeit not perfectly.²⁰¹¹ The historical significance of the Caere relief, stylistically datable to the Julian- Claudian period, but not securely specifiable to the reign of Claudius, leads us to consider another important operation in the Etruscan “revival” of the Imperial period. The monument to which the slab belongs has generally been considered the proof that Claudius, in his moral reform work undertaken in connection with the censorship of 47 CE, had reinstituted the league of the *duodecim populi* that the Etruscans had created around the *Fanum Voltumnae apud Volsinios* and that, according to widespread modern opinion, would have been disbanded after the conquest of Volsinii in 265 BCE (Fig. 38.9).

There are extremely scarce sources on the activity of these assemblies, which have been much discussed.²⁰¹² For the period of autonomy, the arguments essentially concern the degree of political and military union of the league, which is normally considered quite meager and related only to religious topics.²⁰¹³ For the period after the fall of Volsinii, they concern the possible dissolution of the league, and for the period after 89 BCE, they concern the date and structure of its formal reconstitution (or reform), beginning with the increase in its membership size from twelve to fifteen

cities and ending with the final list of these fifteen *populi*.²⁰¹⁴ According to Tacitus (Ann. 11.15), the emperor Claudius, during his censorship in 47 CE, had delegated to the pontiffs the task of controlling the continuity of the care for the *disciplina*, the only genuine *haruspicina*, the Etruscan one. On the other hand, attributing the new foundation of the Etruscan league to Augustus²⁰¹⁵ appears to be a safer solution in view of a few cases of *praetores Etruriae* preceding the reign of Claudius²⁰¹⁶ and, above all, of the data provided by archaeology.

Fig. 38.9: Central area of the Fanum Voltumnae sanctuary in the Roman phase (after *AnnMuseoFaina* 16, 2009, p. 462, fig. 15)

Recently, in fact, after centuries of discussions about its location, the *fanum Voltumnae* has finally come to light in the immediate vicinity of the northeastern extremity of Orvieto, corresponding to the city of Volsinii,

destroyed after the serf revolt in 265 BCE. The first campaigns of excavation²⁰¹⁷ have brought to light a number of temples and altars within a very wide sacred area with phases ranging from the Archaic and Classical periods to the Roman times. These structures reveal—or seem to reveal—traces of the Roman sacking of 265. The heart of the Roman presence consists of a small temple with its altar (strangely labeled as “donarium”) and of what appears to be a great brick hall with a mosaic floor, but preserving traces of much earlier phase which must have played a central role in the life of the sanctuary in the Imperial period, perhaps as the seat of city delegate meetings and of the election of the *praetor Etruriae*. Transformed into an edifice for Christian worship in the Caro-lingian period (fragments of marble decoration of that date are known) dedicated to St. Peter,²⁰¹⁸ which medieval sources, significantly, define as *in vetere*, this hall presents a phase in *opus reticulatum* interpreted by the excavators as the remains of a *domus*, a structure hard to imagine at the center of a suburban area. The phase in *opus reticulatum* is considered proof of the existence of a special interest in the *fanum* at the beginning of the Imperial period, as evidenced by the appearance in a few places in the walled sanctuary of the same technique. These buildings demonstrate that there was a specific interest in the site on the part of the elite of the Etruscan cities, if not the emperor himself, given the connotations of the construction technique directly bound to Rome, a clear proof of the intervention of urban workers.

That this was indeed the heart of the sanctuary in the Roman period has recently been confirmed by the building, not far from the hall, of a small thermal installation fed by a rudimentary aqueduct. The baths, although modest, represent an obvious tribute not only to the Roman passion for “sociability” that develops within the λουτρὸν λυσίπονον,²⁰¹⁹ and they constitute a facility needed by the distinguished Etruscans who gathered for the festivals, as well as for sports activities of the *ludi* that were, as in the past, at the core of the life of the sanctuary. The presence of bases of large and small votive offerings in the excavations that reveal signs of violence has been considered proof of the Roman plundering of the sanctuary in 265. This is in addition to the mention of 2000 bronze statues (presumably of all kinds, including little ones) that according to the *misorhomaïos* Metrodorus of Scepsis were plundered by the Romans from Volsinii.²⁰²⁰ Clear evidence is provided by the *sigilla* seized and dedicated by M. Fulvius Flaccus in the triumphal sanctuary at Sant’Omobono in Rome (Figs. 38.10., 61.2).²⁰²¹ Unfortunately not yet available are two crucial pieces of information. The first concerns the possible interruption in the life of the sanctuary between 265 and the very early imperial age, when the ceremonies and *ludi* were resumed. The second concerns the exact dating of the beginning of the institution’s Roman phase, although the preliminary reports offer a glimpse of persistent building activity mentioned here and there in those reports, and they speak of abundant evidence of first-century BCE pottery.²⁰²² The presence of tombs throughout

the area and from Early Medieval dwellings within the baths witnesses that in the sixth century CE the site was in neglect, except for the church. The new archaeological data is of the outmost importance and seem to prove definitively—as I suggested decades ago—that the reorganization of the sanctuary took place long before the reign of Claudius, at the beginning of the reign of Augustus. This was the moment when *the princeps*, obeying the antiquarian urge of the age that was widely shared by the classes that formed his main political support, as part of the construction of his personal power, “archaeologically” revived religious institutions of a time that had sunk into oblivion. This would include the revival (or reinvention) of the *Fratres Arvales* brotherhood, which dates around 29 CE.²⁰²³

Fig. 38.10: Latin inscription mentioning M. Fulvius Flaccus from the Sant’Omobono area at Rome (after Torelli 1968, fig. 1)

Fig. 38.11: Latin inscription mentioning C. Metellius C.f. Stell. [praet(or)] Etruriae. Cortona, Museo dell’Accademia Etrusca (after Liou 1969, pl. 6)

There was a very active participation of senators, *equites* and local dignitaries, all or almost all without a single drop of Etruscan blood, belonging to the cities of Etruria, in the life of the renewed *Fanum* and added to their careers the coveted titles of *praetor Etruriae* or *aedilis Etruriae* (Fig. 38.11).²⁰²⁴ The Augustan restoration of the league increased the number of the cities from twelve to fifteen to satisfy the ambitions of the centers that had more recently emerged into notoriety compared to the original composition of

the dodecapolis. While the aedileship was reserved to the *domi nobiles*, the praetorship was usually the prerogative of persons of senatorial rank, let alone emperor Hadrian himself.²⁰²⁵ In the Late Imperial period, following Diocletian's provincialization of Italy, the originally Etruscan festivals of the *Fanum Voltumnae* became the center of the imperial cult for the province of *Tuscia et Umbria*.

This merged the Umbrians—who had become part of the same province—with this Volsinian festival. A few years later, however, the Edict of Hispellum issued by the emperor Constantine²⁰²⁶ authorized the Umbrians to celebrate the *ludi* and festivals of the imperial cult in their own main city. The new title of *coronatus Tusciae (et Umbriae)*—parallel to the Greek title of *axeσavpιcπoπoc*;²⁰²⁷ which was awarded to the provincial *archiereis* of the Greek-speaking provinces—is dated to this period. The new title serves as evidence that the primary function of these priests was to take care of the imperial cult entrusted to the *praetores Etruriae*.

3The legitimizing past: Familial ambitions

We know very well²⁰²⁸ how important the display of illustrious ancestors was for family fortunes in Rome, especially gentes of great antiquity. In the *alae* of the noble houses the *armaria* showed the *imagines maiorum* connected by ribbons²⁰²⁹ to form *stemmata*, family trees, whose antiquity is directly proportionate to the prestige attached to them by the *communis opinio* of all, patricians and plebeians, *honestiores* and *humiliores*. With the entry of the Etruscans into the Roman state with the full privileges of the *civitas optimo iure*, the ruling classes of the individual cities, regardless of whether or not they descended from ancient Etruscan *principes*, could count on the antiquity of their own *stemmata*. The authenticity thereof rested in family archives that could date back centuries, and often included among an ancestry persons of the first rank in the *Tuscae historiae*, which we know were cultivated locally from the late republican period through the entire imperial age.²⁰³⁰ That is how it could come about that in the first century CE a poet with ancient Etruscan origins like Persius from Volaterrae could aim the pointed barbs of his satire at his compatriots who boasted the most lofty Etruscan family trees. “Or are you to puff out your lungs with pride because you come of a Tuscan stock, yourself the thousandth in the line...?”²⁰³¹ For a *domi nobilis* from one of the main Etrurian cities, the possibility of exhibiting that sort of pedigree could signify rapid access to the senate and (gods willing) the achievement of prestigious and lucrative responsibilities in the government starting with urban offices in Rome. But this was not the rule. C. Maecenas, an Arretine *eques* of great wealth,²⁰³² hymned by Horace as a descendant of kings, even refused to undertake a senatorial career to become, in the felicitous definition

of Ronald Syme, a “member of the cabinet” and one of the brains behind “the national program” of the *princeps*.

Through this research into noble ancestry, Etruria has provided us with a series of very interesting cases. The simplest stratagem, carried out time after time in every part of Etruria, is to resurrect famous names of the past. From the many cases of sought after homonymy one of the clearest is that of the Velimna-Volumnii, known from various documents from Perusia, among others. Giovanni Colonna²⁰³³ has recently offered a plausible reconstruction of the history of this illustrious family of Perusia. After the death of *Arnth Velimna*, author of the realization of the famous tomb that bears the name of the Volumnii and in which he had prepared resting-places for all the members of the family, the hypogeum was abandoned very soon, only to be reopened around 50 BCE²⁰³⁴ to accommodate the marble urn with the inscription of P. Volumnius A. f. Violens (Fig. 38.12). He was the son of a person whose name deliberately recapitulates that of a famous citizen of three centuries earlier, mentioned above, who was consul in Rome in 302. As is proven by the epigraphic and archaeological evidence from the tomb, this first-century person had aimed for an intentional revival of the *tria nomina* of the Roman consul in the name of a certainly false direct descent. To give still more credit to these (false) origins, useful under both the strictly Roman profile and the Perusian and Etruscan one, he proceeded to reopen the tomb to deposit the ashes, which led all local citizens to believe that he was to be considered descendant of the *nobiles Velimnas* of the fourth century BCE.

Another justly famous case, inspired by the series of statues and *elogia* of the *summi viri* of Rome in the Forum of Augustus, is that represented by the Latin inscriptions containing three *elogia* of people from Tarquinia’s most glorious historical times.²⁰³⁵ Considerable parts of the first and last of the three *elogia* are preserved; not much survives of the second inscription. The texts illustrate the career of these three Tarquinians between the end of the fifth and the second half of the fourth century—all praetors (i.e. *zilath*), members of *Spurinas* family one of the most famous in Tarquinia and in my opinion owners of the splendid Tomb of the Ogre.²⁰³⁶ Their names are Latinized as Velthur Spurinna Lartis f., Velthur Spurinna Velthuris f., and A. Spu-rinna Velthuris f., respectively founder of the fortunes of the family, his son, and his nephew (or younger son) (Fig. 38.13).

Fig. 38.12: Marble urn with the inscription of P. Volumnius A.f. Violens Cafatia natus. Perugia, Archaeological Museum (photo by M. Torelli)

The founder, Velthur Spurinna Lartis f., twice praetor, was the commander of the small Tarquinian contingent that participated in the 415–414 Athenian expedition against Syracuse, mentioned only as generic “Etruscans” by

Thucydides (6.88.6; 7.53.2; 7.54; 7.57.11). It is Thucydides who documents the victory—the only Athenian victory in the entire campaign—achieved by the Etruscan troops who had remained to guard the encampment, and who even raised a trophy to celebrate the victory. The *elogium* registers the Etruscan version of the events, which are presented as the first successful *traiectus* of an Etruscan army in Sicily and the granting to this army of a crown (?) of gold, possibly a version in Etruscan terms of the trophy erected at Syracuse.

Fig. 38.13: Latin inscription mentioning VelthurSpurinna. Tarquinia, Archaeological Museum (after Torelli 1975, pl. 4)

A. Spurinna Velthuris f., thrice praetor, enjoyed recorded successes that we can easily connect with the war between Rome and Tarquinia of the years 358–353, always seen from the Etruscan perspective (Fig. 38.14). The recorded events mention the overthrow of the king of Caere and the conquest of nine *oppida* by the Latins, i.e. by the Romans, perhaps with the aid of the Falisci. The two events, read instead in the light of the Roman annalistic tradition, coincide first with Caere's defection from the traditional alliance with Rome, and second with the news of the *tumultus Etruscus* proclaimed by the Tarquinian presence at the gates of Rome. This is where the *Decem Pagi* were located, a Roman possession on the right bank of the Tiber, dating, according to tradition, back to the time of Romulus. To these deeds the *elogium* adds a report of an otherwise unknown intervention by A. Spurinna at

Arretium in connection with a *bellum servile*, an episode that has been confirmed by Augusto Campana and Adriano Maggiani.²⁰³⁷ There is also a report (now preserved in a manuscript of the Vatican Library) of an Etruscan inscription from Tarquinia that refers to the elogium of *Cilnei*, a noble woman from Arretium (Maecenas belonged to this *gens*) who was married to *Arnth Spurinas*. It is obviously a matrimonial seal of the Arretine interests of the *Spurinas*.

Fig. 38.14: Latin inscription mentioning Aulus Spurinna. Tarquinia, Archaeological Museum (after Torelli 1975, pl. 4)

This is not the place to discuss the various historical interpretations of the content of these *elogia*. I would rather explore how these notices were transmitted from the period to which they refer to the early imperial age, when the *elogia* of the Spurinna family were written, and try to identify the person who commissioned the monument. With relative certainty, we can attribute this undertaking to Vestricius Spurinna, who lived in the time of Augustus and Tiberius, and was the father or grandfather of a prominent member of the Roman senate in the first century CE, T. Vestricius Spurinna, *cos.* II100 CE. These Vestricii descended from the *Vestarcnie*, a fourth century aristocratic family in Tarquinia whose family tomb in the necropolis of the Secondi Archi²⁰³⁸ is known, with sarcophagi for only two generations and which somehow merged with the family that owned the Tomba del Cardinale.²⁰³⁹ The Augustan-Tiberian Vestricius Spurinna bore a second *nomen* because he was the son of a *domi nobilis* Vestricius, who lived from the middle of the first century BCE to the time of Augustus, and of Spurinnia, daughter of Caesar's haruspex, known to us from Cicero and other sources.²⁰⁴⁰ Naturally Caesar's haruspex was not a direct descendant of the great *Spurinas* celebrated by the *elogia*, since the line might have ended already in the last years of the fourth century. The social and political marginality of Caesar's haruspex Spurinna

and the slow ascent of the Vestricii to whom he was related tell us that the haruspex was almost certainly an indirect descendant of freedmen of the great *Spurinas gens* of our *elogia*.

A series of facts attest the premature disappearance of this illustrious fourth-century Tarquinian family. First, it appears that *Cilnei* (who was originally married to *Arnth Spurinas* in whom we should perhaps see a son of Aulus Spurinna) was remarried. Second, the sarcophagus²⁰⁴¹ of a different *Arnth Spurinas*, son of *Vel Spurinas* and of a *Thanchvil Cuclni*, was placed in the Tomb of the Partunus family. Finally, there was a deliberate, programmatic destruction of the walls of the second chamber of the Tomb of the Orcus—which had depicted the banqueting ancestors of the *Spurinas*—to make room for the new occupants of the hypogeum, the *Smurinas*. This does not mean that the archive of the *gens*, on which the notices of the *elogia* certainly depend, had been destroyed or dispersed. The probable existence of the *liber de gente Spurinnia*, similar to the *libri de gente Iunia, Claudia, Cornelia*, or *Fabia* written by Cicero's friend Atticus²⁰⁴² on the *gentes* of Brutus, Claudius Marcellus, Cornelius Scipio, or Fabius Maximus, is brought to our attention by an anecdote recorded by Valerius Maximus (4.5, ext. 1), “ante gestum ... quam civitas Etruriae daretur.” It speaks of an extraordinarily beautiful boy called Spurinna, who disfigured his face to preserve his own *sanctitas*, because his appearance aroused such desires in the women of rank, “com-plurium feminarum inlustrium sollicitaret oculos.” The anecdote is in itself of little significance, but the circumstances it reveals are of extreme interest. This is because they document private events of persons of illustrious birth (and of strict customs...), which happened long before the grant of the Roman citizenship. We must presume the existence of compilations based on memories of the *gens*, from which the author of the *elogia* must have drawn. These familial archives, together with public records of events and the religious literature underlying the *Tuscae historiae*, are one of the main points of reference of the Etruscan heritage. Etruscan heritage was still continuously used in the early imperial age for the purpose of family propaganda, however much of that heritage they proclaim, usually falsely, to have held.

The familial memories entrusted to the *tabulae* and kept in the *tablina* of the patrician houses were not the only sources that could be relied on for the purpose of glorifying their own stock. Sometimes where the conditions were met, reference could be made to objects that we know were used as vehicles of memory. These were, for example, insignia of power, or plunder from the family's military undertakings, such as the *tabulae* that “lay” in the same *tablina*, not unlike the *keimelia* in the aristocratic residences of the Greeks in the Homeric age. Such objects had an immense evocative power, and their antiquity was a guarantee of the *virtus* and *honores* deserved by the ancestors. The sculpted “thrones” in the archaic chamber tombs of Caere were identical to the *solidae sellae* of the vocabulary of the Roman augurs.²⁰⁴³ The thrones

were eternal proof of the right to the *auspicia* enjoyed by the *gens*, precisely as the images of arms and human figures expressed in relief in the Tomb of the Volumni at Perugia²⁰⁴⁴ constituted a reference to familial *res gestae*, the same as those that are recalled in the Roman patrician *domus* of insignia, trophies, and *manubiae* of war that the generals in the family displayed in the *vestibula*, *atria*, and patrician *tablina*.²⁰⁴⁵

The “Corsini Throne,” an enigmatic object found in 1732 during construction of the family chapel ordered by Pope Clement XII Corsini in St. John Lateran in Rome and preserved in the Corsini Collection, belongs to this category of object.²⁰⁴⁶ The “Throne” is in fact a replica, quite faithful in many ways, very approximate in others, of a seat with a curved back and circular base. It is in the form of the most archaic *solida sella* of the *auspicia*, and is decorated in relief with continuous friezes on the back depicting a parade of soldiers and a hunt, and vegetal friezes and a funerary cult ceremony on the base. It is clearly an imitation of an Etruscan object in embossed sheets of bronze, probably of the Archaic or Late Archaic period, in iconographic harmony with bronze works of northern Etruria. This peculiar object must have decorated the *tablinum* of a Roman aristocratic house to commemorate the glories of a stock going back to earlier centuries. It could evoke with the very form of insignia of power a past of *reges* and *principes* among the most prestigious civilizations of the peninsula (Fig. 38.15).

It was discovered in the *Lateranum*, the residence of the Plauti, one of the most eminent late republican and early imperial patrician families of Rome. Two branches of the family are known, the Plauti Silvani and the Plauti Laterani. The *Lateranum*, a princely possession where much later the cathedral of Rome was built by the emperor Constantine, belonged to this second branch, which was involved in the Pisonian conspiracy, the reason for the confiscation of the *praedia* of the family of the Laterani by Nero. The greatest fortune of the other branch, that of the Plauti Silvani, was the marriage of the first *praetorius* of the line, M. Plautius Silvanus, with Urgulania, mother of the first consul in the family, M. Plautius Silvanus *cos. ord.* 2 BCE. She was definitely of Etruscan origin, as illuminated by Jacques Heurgon,²⁰⁴⁷ perhaps a descendant of Velthur Orgolnius, the *Caeritum rex*, who, according to the *elogium* of A. Spurinna, would have been dethroned by A. Spurinna.²⁰⁴⁸ Urgulania, who succeeded in arranging the betrothal of her granddaughter Plautia Urgulanilla to the future emperor Claudius, pursued a consistent matrimonial policy for the members of her clan, both the Silvani and the Laterani, with senatorial *gentes* of the same origins, from Etruria or adjacent cities of Umbria. Known for gestures of true Etruscan *severitas*, this fearsome lady was able to count on the favor of Augustus’ powerful wife to uphold the fortunes of the Plauti. She had certainly taken advantage of her “royal” Etruscan origins to lift out of anonymity her husband’s family, whose origins were from Trebula Suffenas, an extremely obscure municipality in the Tiburtine mountains. The family had made a modest appearance in the Roman

senate in the early first century BCE, and had laboriously recorded the above-mentioned praetor during the reign of Caesar. Whether her own claims of royal ancestry were true or false, Urgulania brought a member of her family close to acquiring the imperial throne: boasting of royal Etruscan origins thus paid off.

4The powerful vehicle of the Etruscan legacy: ***Disciplina***

A custom of obscure origin, but which had become the law of Rome, had it that the *procurationes* of the *prodigia publica* would be entrusted, with the consent of the senate, to Etruscan haruspices. Using the rhythms and hendiadys that are typical of the legal language, Cicero states:²⁰⁴⁹ “prodigia

portenta ad Etruscos haruspices, si senatus iussit, deferunto.” We do not know, however, when this sort of law would have been approved nor whether similar laws were part of the obligations awarded to the Etruscan *principes* to perpetuate the knowledge of the *disciplina*. This is the name of the variegated corpus of haruspicy writings, *libri haruspicini*, *fatales*, *fulgurales*, *rituales*, *Tagetici*, *Acherontici*,²⁰⁵⁰ an obligation confirmed by another legal text cited by Cicero: “Etruria principes disciplinam doceto.” The principle is explicitly given in the normative myth depicted on a well-known mirror from Tuscania,²⁰⁵¹ a splendid confirmation of the antiquity of the tradition of teaching the *disciplina* principally within the aristocratic families of Etruria.

This singular Roman practice of calling on Etruscan haruspices in case of *portenta* reveals the great prestige the adepts of *disciplina* enjoyed. The Etruscan *principes* could not have failed to take advantage of this contact between the two ruling classes to orient the politics of Rome in their favor, although even the Romans had doubts about the bona fides of these soothsayers. As we have seen, the incorporation of Etruria into the Roman state occurred right in the middle of a decline in the quality and quantity of the Etruscan cities’ ruling classes, the reason behind the decline in social and cultural position of the haruspices. At the same time, at all social levels of Rome, superstitions of every type spread, which brought an increasing interest in all forms of reading omens²⁰⁵² and an increasing desire to establish personal relationship with those who were the interpreters of those omens, who due to the new demand multiplied beyond measure. Even if it becomes confused with a jumble of suggestions of an esoteric nature, the speculative interest in *disciplina*, which in the different types of the *libri haruspicini* amply nourishes antiquarianism, was fed by persons of varied origin. Some were Italic, as in the case of C. Fonteius Capito,²⁰⁵³ but most were Etruscan, such as the Volterranean A. Caecina, who was active in Roman political life at the time of the civil wars, and P. Nigidius Figulus, likely from Perugia, senator in the first half of the first century BCE,²⁰⁵⁴ fragments of whose work survive in the *De ostentis* of John Lydus (see below). As for personal relationships between haruspices and prominent individuals on the Roman political scene, we know of several examples beginning in the last decades of the first century.²⁰⁵⁵

Fig. 38.16: Inscription mentioning M. Tarquitiu Priscus and M. Tarquitiu Etruscus. Tarquinia, Archaeological Museum (after Torelli 2005, fig. 2)

From the private *haruspices* of C. Gracchus, Sulla, and Caesar, we pass, with the empire, to the institutionalized form of the *haruspices Caesarum*. Recently, thanks to a new inscription from Tarquinia (Fig. 38.16),²⁰⁵⁶ we have learned the name of Tiberius's *haruspex*, the most famous writer of *disciplina* M. Tarquitiu Priscus.²⁰⁵⁷ Rather than Priscus himself, his son M. Tarquitiu Etruscus is probably the author of the reorganization, perhaps coinciding with the reinforcement of the *ordo LX haruspicum*,²⁰⁵⁸ of the college of *haruspices* based in Tarquinia that was ordered by Claudius. The history of private *haruspices* is thus bound up with the fortunes of this *ordo*, which was certainly very ancient. It was headed by a *magister* and had sixty members, who contributed to the college a fixed number of *pueri*, boys intended for instruction in the *disciplina*. The number sixty appears to relate to the composition, whether twelve or fifteen of the league's *populi*, who respectively would have contributed to the *ordo* five or four *pueri* from the families of the *principes* (although these figures conflict with the six and ten *pueri* given by Cicero and Valerius Maximus, respectively).

Still at Tarquinia, opposite the Ara della Regina temple, a group of fragmentary inscriptions on colored marble bearing the *fasti* of the *magistri* of the college has come to light in various times. The list only starts from the grant of Roman citizenship in 89 BCE and provides a sequence (that may be fairly complete) of only four *magistri*, for whom are provided the *tria nomina*

and a brief *elogium* of their professional *res gestae*. The first of these four, maybe the first in the list, is an unnamed *magister* of the second quarter of the first century, the author of *procuraciones* of *ostenta ful-guralia(?)*, *carmina* (prophecies in verse), and many *divinationes augurales*, whose *disciplina* was to be deposited near the Roman priestly college of the *decemviri sacris faciundis* (from 51 BCE *quindecimviri*) (Fig. 38.17.a). The second is P. Coelius P. f. Etruscus, of whose activities almost nothing is preserved, though they must have occupied the second half of the first century, perhaps before Volcatius, the haruspex who died soon after prophesying the end the ninth century with the appearance of the *Iulium sidus*,²⁰⁵⁹ and before the anonymous *haruspex* who predicted the death of Augustus²⁰⁶⁰ (if they were indeed *magistri* of the *ordo*) (Fig. 38.17.b).

The third, as had been conjectured by E. Bormann,²⁰⁶¹ even though he united the fragments known to him into a single *elogium*, is M. Tarquitiu Priscus, author of frequently cited Latin books of *disciplina*. Priscus certainly had a good knowledge of the Etruscan language; we now know him to have been Tiberius's haruspex. As stated in the last line of the text, he enjoyed a long career, of many, many years (at least *[tringin] ta*, if not actually *[quadragin]ta*). Beginning in 13 CE, he served in Tiberius' retinue in Illyria with a rather obscure activity in the area of the *Pagus Arusnatum* (possibly to be placed an area near the Garda Lake) and with the "invention" of his client's personal goddess, Iustitia; and the end came with the denunciation of the *comitia iniusta* of Sejanus in 32 CE.²⁰⁶² The fourth is the son of Tarquitiu Priscus, M. Tarquitiu Etruscus, successor to his father in the reign of Caligula or Claudius, who, as we have seen, together with Caesennius (the *cos. ord.* of 61 CE?) was responsible for refurbishing with colored marble the meeting place of the *ordo*²⁰⁶³ near the heroic tomb of Tarchon, a cenotaph merely glimpsed by the excavations under the altar of the Ara della Regina temple.²⁰⁶⁴ It is possible that this place was considered the location of the *ager Tarquiniensis*, from whose land was supposed to have emerged the *puer prodi-gialis Tages*,²⁰⁶⁵ who was credited with having taught Etruria the arts of hepatoscopy and other forms of divination used by haruspices. Among the manifestations of the centuries-long contact between Rome and Etruria through the haruspices, Tarquitiu Priscus is the last to have had major political success. Although the *ordo LX haruspī-cum*, the *haruspices Caesarum* and the *haruspices Augustorum* continued to be spoken of,²⁰⁶⁶ the political relevance of the *disciplina* thereafter died out, probably in combination with the fading away of the direct transmission of the cultural heritage of Etruria.

Fig. 38.17: *Fasti* of the college of LX Haruspices: a. fragment 1; b. fragment 2. Tarquinia, Archaeological Museum (after Torelli 1975, pl. 8–9)

Thanks to transmission related to the study of divination by hepatoscopy and the observation of *ostenta*, haruspicy and the literature connected with it, though in forms little controlled and always a bit barbarized, spread widely in the empire, far beyond Etruria and even Rome itself. It was long destined to remain not only a form of popular divination (we even hear of *haruspices legionis*!) which would recur at particular moments, but also a memory of an ancient custom preserved in cultural environments whether lofty or less cultivated. In the late empire it spawned fierce conflicts with the ever more successful Christianity.²⁰⁶⁷ The two aspects—the popular and the cultured—

come to light in the final throes of the old world.²⁰⁶⁸ In terms of the popular aspect of haruspicy, it suffices to recall the appearance in 408 CE at the gate of the City of some haruspices coming from the Umbrian city of Narnia, claiming that they were capable of warding off the threat of Alaric at the gates of Rome solely by the practice of the ancient rites.²⁰⁶⁹ Similarly, it is worth noting the “Etruscan” haruspices mentioned by Procopius; or again the haruspices condemned by the Fourth Council of Toledo in 633.²⁰⁷⁰ For the role of the *disciplina* on the cultured level, we turn to two learned men at the threshold of the Middle Ages. Martianus Capella, in the West, managed to gather echoes of haruspical doctrine. John Lydus, in the East, still had access in the Constantinople of Justinian to good antiquarian sources from many centuries earlier, and explored the “silver heirloom” of a past, of which the *basileus* of Byzantium still demonstrated need and of which the doctrine of the *ostenta*, the ultimate heritage of the *disciplina*, was fully a part.²⁰⁷¹

IV. Civilization

Early Iron Age

Lars Karlsson

39Hut Architecture, 10th cent.-730 BCE

Abstract: The development from a large oval Proto-Villanovan hut placed in a cut channel—via the compact Villanovan hut with substantial wattle-and-daub walls—to the rectilinear hut of the Orientalizing period, built with traditional “hut materials” but on a new plan took about 500 years. In the second half of the Orientalizing period, terracotta roofs were introduced as well as quarried ashlar blocks in walls and foundations. With the Archaic period, Etruria abandoned its prehistory and entered the architectural koine of the Mediterranean world.

Keywords: Early Iron age hut, oval hut, rectangular hut, cinerary urn

Introduction

In his introduction to “the origin of the dwelling house” in Book II, Vitruvius writes: “And first, with upright forked props and twigs put between, they wove their walls. Others made walls, drying moistened clods which they bound with wood, and covered with reeds and leafage, so as to escape the rain and heat.”²⁰⁷² His words are a good introduction to Etruscan building construction, which will be discussed in this chapter.

The sources for our knowledge of prehistoric hut architecture are first of all the archaeological excavations conducted since the 1950s. There perishable materials used in the construction of huts, however, are difficult to detect during an excavation. We uncover the bedrock cuttings, stone socles and daub fragments for the construction of the huts. From these we can only attempt to restore the huts themselves.

In the Early Iron Age, people began making their cinerary urns in the shape of huts, both in terracotta and in bronze. These are the main source for our reconstructions of the huts’ walls and roofs together with the few preserved house models from Greece. Shepherds’ huts, especially from the Roman *campagna*, further furnish information about this architecture of intricately twisted branches and plaited twigs.²⁰⁷³ The *campagna* hut fits the description of Vitruvius; it consists of a palisade wall of closely placed posts, which are tied together at the top by a very long “osier-tie” running around the hut. The roof rafters are then tied to this osier-tie ring and bound together at the top. Because the ring is self-contained, the hut does not need internal supports. For the sake of clarity, this chapter has been divided into three chronological periods. According to Swedish archaeologists, at some sites the culture called Proto-Villanovan continues uninterrupted into the Villanovan period.²⁰⁷⁴ In

general terms, the development suggests an increased use of durable building materials: primarily wood in the Proto-Villanovan period, and stone socles and sun-baked clay in the (more advanced) Villanovan period. In the Orientalizing period, these two materials are further developed in combination with the rectilinear house plan and the use of larger, but still unworked blocks in the foundations.

1The Proto-Villanovan period 1.1 San Giovenale

1.1San Giovenale

Many remains of prehistoric huts were discovered from 1956–1965.²⁰⁷⁵ In Area D, Hut 1 measures 10.4 m in length and has a maximum width of 5.28 m.²⁰⁷⁶ The remains consist of cut channels in the tufa bedrock occasionally combined with thin lines of rocks placed outside of the cut channels. In the interior two rows of postholes indicate a three-aisled inner space. The huts are oriented southwest-northeast and have floors placed a couple of centimeters above the bedrock. Along the walls there is a dais—an elevated platform. The entrance to the huts was on the shorter southwestern side, as can be understood from a 60 cm long interruption in the channel. (Fig. 39.1).

In Area F East, several segments of cut channels from four oval huts were found under the Archaic houses, also oriented southwest-northeast.²⁰⁷⁷ The cut channel has a width of about 10 cm. At the bottom of Oval Hut 1 a hearth was found with pottery of the earliest Proto-Villanovan type. Two charcoal fragments were dated surprisingly early, to between 1400–1200 BCE.²⁰⁷⁸

Two huts were excavated in Area E. Oval Hut I measured 8–8.5 m in length and about 5 m in width.²⁰⁷⁹ It was built in a cut channel but in the northwest, as the bedrock drops off, it stood on a foundation of tufa chips placed on a bed of white river stones.

Fig. 39.1: San Giovenale. Area D. Tower photograph (from Malcus 1984, pl. II:1)

White river stones also covered the floor of the hut.²⁰⁸⁰ Postholes suggest a three-aisled plan. Another hut of the same size and with a cut channel can be traced in the southeastern part of the trench. The opening for the door can clearly be seen on the shorter western side. This hut is oriented in the normal southwest-northeast direction, while Oval Hut I is oriented more strictly east-west.

Finally, in the southwestern parts of the Borgo excavations there was the remarkable discovery of a large channel cut along the edge of the tufa plateau.²⁰⁸¹ This channel was cut to hold the standing logs of a palisade. The channel was 0.30–0.40 m wide and about 0.60 m deep. Behind the channel, on the city side, a series of postholes located about one meter from the channel were cut in the bedrock, presumably to support diagonal struts, which buttressed the palisade from the inside.²⁰⁸²

1.2 Sorgenti della Nova

The excavations at this site from 1974 have uncovered a Proto-Villanovan settlement with three different types of dwellings. Two of these are cave dwellings, but the third consists of oval huts with cut channels with a three-aisled interior on three pairs of posts (Fig. 39.2).²⁰⁸³ They are oriented

southwest-northeast. One of the huts measures about 11 x 8 m.²⁰⁸⁴

2A restored Proto-Villanovan hut

The Proto-Villanovan hut was built standing in a bedrock-cut channel with a width and a depth of about 10 cm. The plan was oval, but the short sides are flattened in order to give to the hut as broad and as wide an interior as possible (Fig. 39.3). The hut is normally oriented in a southwest-northeast direction with a door opening of about 60 cm in the southwest. The huts are large, measuring more than 10 m long and more than 5 m wide, normally with a ratio between length and width of 2:1. The evidence from Vitruvius and from the huts on the Roman *campagna* suggests that the walls were built with upright standing props placed at short distances from each other. The spaces between the props were filled with interwoven branches and twigs, and covered with leaves. The evidence from the palisade channel of San Giovenale suggests that the props could also be placed close together to form an impregnable “palisade wall.” This made the walls stronger and prevented strong winds from blowing through them.

The interior space was divided by two rows of three posts each into three aisles, the central of which was the widest, at about 2 m. The three pairs of posts were placed about 2.5 m from each other, giving the central higher space of the hut—the “clerestory”—an open space of about 7.5 x 2 m.²⁰⁸⁵ The first and last pair of interior posts carried a horizontal beam, on which rested the hut’s front and back roof rafters. This formed triangular openings in the hut’s roof, which allowed for smoke from the hearth and braziers inside the hut to escape. The rafters on the long sides of the hut were tied together in pairs and were probably not connected by means of a ridgepole, as many hut urns show a convex roofline. The roof was covered by thatch, or an Italian weed called *canne* (reeds).²⁰⁸⁶ In order to keep the material on the roof, wooden bars were placed crossing at the apex of the roof.

Fig. 39.2: Sorgenti della Nova. Elliptical Hut Ab. 2 in Sector III (from Negroni Catacchio and Domanico 2001, fig. 3)

Fig. 39.3: Restored view of a Proto-Villanovan hut. Note the standing logs placed tightly together in the rock-cut channel (drawing by J. Blid Kullberg, 2011)

3The Villanovan period

The Villanovan huts, which can be found immediately below the Archaic settlements, are often destroyed by the heavy leveling that was done for the stone foundations of the Archaic houses. In Etruria, only segments of these oval or round huts have been found.²⁰⁸⁷ In this period some huts were still built with walls standing in cut channels in the Proto-Villanovan way, but by the eighth century, huts on stone socles seem to be the more common practice.

3.1San Giovenale

Scattered traces of huts built on stone socles can be recognized at San Giovenale. In Area F East, six segments of stone socles were recorded together with large amounts of loose stones and pebbles from floor levels. In connection with these, Villanovan pottery and a total of 363 daub fragments were found, many with impressions from branches and twigs.²⁰⁸⁸

In Area E, Oval Hut II was built on a level about 1 m higher than the Proto-Villanovan Oval Hut I and was completely built with walls on a limestone rubble socle. Only the western section of the hut was preserved. The diameter of the western rounded end of the hut would have been about 6–7 m and its placement indicates that the hut was oriented southwest-northeast. The floor

consisted of tightly packed tufa chips and pebbles. Clay was discovered on the limestone wall ring, and was interpreted as disintegrated revetment daub with impressions of branches and twigs.²⁰⁸⁹ On the floor eighth-century pottery and a lid of an Italo-geometric pyxis were found, indicating that this hut may have remained in use into the Orientalizing period in the first part of the seventh century.²⁰⁹⁰

3.2 Cortona

A well-built stone socle of a curvilinear hut was found at Cortona on Via Vagnotti.²⁰⁹¹ The wall was almost a meter thick, indicating a very substantial hut. The large post-holes in the interior must have been for supporting the roof—or rather, the central higher section of the roof with the smoke holes.

3.3 Veii

The traces of huts under the altar area of the Portonaccio temple consist of two lines of cut channels;²⁰⁹² one is an oval segment belonging to a hut with large postholes inside. However, the other is almost straight and may have been a wooden palisade with a line of supporting wooden props behind it, very similar to the situation on the Borgo of San Giovenale. Furthermore, a segment of a similar hut with a cut channel and postholes inside was found by the Northwest Gate.²⁰⁹³ The possible four large postholes inside reflect the typical Villanovan roof arrangement.

3.4 Caere

An eight-meter long oval channel was found under the temple at Sant'Antonio.²⁰⁹⁴ It ends in the southwest, indicating the entrance to the hut in this direction (cf. the huts of San Giovenale). A large posthole outside suggests the existence of a porch.

3.5 Tarquinia

In the area called Calvario in Tarquinia, the excavations of 1975–1978 uncovered traces of twenty-five huts. Of those that were better preserved, four had an oval plan with three interior aisles, and seven had a rectangular plan. The excavator suggested (probably correctly) that the rectangular huts are

later, as they seemed to be aligned with a street that later crossed one of the oval huts. I do not believe that the oval and rectangular huts are contemporary and in this way reflect different functions. The oval huts are dated to the beginning of the Villanovan period.²⁰⁹⁵ One measures 10.5 x 5.6 m, with the largest measuring about 16.5 x 8.5 m (Fig. 39.4). They are oriented southwest-northeast, with the doors opening on the shorter southwestern side (two huts have a second door opening on the longer southern side).

The later rectangular huts are smaller than the oval huts, measuring about 8–9 x 4–5 m. One of the huts is furnished with two *antae* at the porch (in trench 33, Fig. 39.4) and another hut has a ring of posts standing around the hut (in trench 14, Fig. 39.4), characteristic traits of the Villanovan period. The interior has one row of two posts, giving the hut two aisles.

3.6 Monteriggioni-Campassini

Three huts, dated to the second half of the eighth century BCE, were discovered in Monteriggioni-Campassini in the 1980s and 90s. They are aligned east-west, measure about 8 x 4.5 m, and are of an oval plan with somewhat rectilinear side sections (Fig. 39.5).²⁰⁹⁶ The interior space of the huts have been cut into bedrock and the walls are built with posts standing in holes placed at a distance of about 1.6 m. The posts are placed along the edges of the recessed interior space.²⁰⁹⁷ The wattle-and-daub walls would have stood partly between the posts and partly on the raised bedrock surrounding the hut.

4 Hut urns

About 200 cinerary urns in the shape of huts have been found in Etruria and Latium.²⁰⁹⁸ The majority of these hut urns (76%) have circular ground plans, 13% have oval plans, and 11% have rectangular plans. Although they all date to the ninth-eighth centuries, it is not possible to detect a development from one plan type to another.²⁰⁹⁹

Fig. 39.5: Monteriggioni-Campassini, hut C (from Bartoloni 2001, fig. 8)

Fig. 39.6: Bronze hut urn (photo SAR-Laz)

A well-known example comes from Vulci (Fig. 39.6). The plan of the hut is oval to round, but it has a straight central roof section. The roof projects considerably over the walls on all sides. The gable sides are set back from the short sides so that the roof slopes down also in front of the gables, giving it the shape of a hip roof. Since the central part of the roof is higher than the hipped sides, smoke holes are placed in the triangular gable. The higher central part carries diagonal bars, which cross and project beyond the ridgepole.

A terracotta hut from Tarquinia reflects the intricate decorations of the developed Villanova huts.²¹⁰⁰ The plan is rectangular, but with outward-bowing sides, as the huts also show in reality. The smoke hole is rounded, indicating that the roof must have been covered with plaster. The apex is decorated with molded horns and the roof is painted with complicated Xs and cross compositions, as well as meander patterns.

5A restored Villanova hut

The interior of ninth- and eighth-century Greek colonial houses were often cut into the bedrock.²¹⁰¹ The huts also had a recessed interior in Etruria and Latium.²¹⁰² Huts from this period are not elongated ovals, but have a more compact plan, round or square with outward-bowing sides. They would have measured about 6–8 m in length and 4–5 m in width.

The walls were built with standing posts anchored in the bedrock or in the

stone socle. The space between the posts was filled with interlaced twigs and branches (wattle). Clay (daub) was then fixed on the twigs and leaves, and left to dry in the sun, the technique being called “wattle-and-daub.” The surface was made smooth and was then covered with plaster. The walls were often about 25 cm thick. Because the clay and the plaster were sensitive to water and rain, roofs were made to project far out over the walls. A “porch” was added on the west entrance side. Often the porch is built under the projecting roof. In these cases, the entrance wall was set back to form a space in front of the door. Roofs were heavier than before, as they were also covered with sun-dried clay. The roof often rested on four large posts (instead of the six typical of Proto-Villanovan construction). The posts went up to the roof and supported openings, both in the front and in the back. As the roof was covered with clay, these smoke openings were now shaped into round or oval windows. The thatch-covered roof was crowned by wooden crossbars and decorated with birds. It is possible that in the early huts, these roof rafters were crossed above the ridge of the roof, as can be seen in some hut urns. In the more developed huts, the roof was probably so heavy that the rafters did not continue through the roof, but were tied below the ridge. The thatch was then held in place by separate crossbars.

Many hut urns have figural and meander motifs incised or painted on the exterior walls of the building, and sometimes also on the roof. This is also evident on the Greek house model from Argos, which is completely covered with decoration. In order to paint the roof, the thatch would have to be covered with clay, which would dry in the sun. Vitruvius describes this technical feature in Book II: “When in wintertime the roofs could not withstand the rains, they made ridges and smearing clay down the sloping roofs, they drew off the rain water.”²¹⁰³ The evidence supports the idea that both the exterior walls and the roofs of the huts were painted, but many hut urns also indicate plastic roof decorations in the form of birds/ducks. Are we to understand them also as molded in clay and baked by the sun on the real hut? David Ridgway and Francesca Romana Serra Ridgway argue that tiled roofs evolved out of the use of sun-dried clay applied to the roof.²¹⁰⁴ However, Nancy Winter suggests that the akro-teria in the shape of griffins and volutes appear only on seventh-century house urns with terracotta tiled roofs, indicating that the later advanced terracotta akroteria did not originate in forms sculpted in sun-dried clay, but may have originated in wooden elements of the hut roof.²¹⁰⁵ This issue is complicated, but one clue may come from the excavations of Area F East at San Giovenale, where ten fragments of bands of relief cordon were discovered.²¹⁰⁶ They are made from a light dried mud rather than from clay. This is possibly the material that Vitruvius writes about in his introduction (“drying moistened clods”).²¹⁰⁷ I have suggested that these pieces are traces of the hut’s exterior decoration. They are in the shape of cordons and are very similar to the cordons decorating Archaic Etruscan *kalypteres* tiles and the apex of the Perachora house model.

6The Orientalizing period

The remains of Villanovan huts are difficult to trace, but the evidence from the Orientalizing period is even more difficult to find. A well-dated rectangular hut from San Giovenale is the best example of a transitional building, pointing back to the construction techniques of the Villanovan hut, but anticipating Archaic architectural planning.

6.1San Giovenale

The Orientalizing rectangular houses in San Giovenale can be found under the Archaic ashlar-built houses. The pottery discovered on the river stone beds in House I in Area F East date to the middle of the seventh century, or to around 675–625.²¹⁰⁸ The building is a rectangular hut, measuring in total 12 m (approximately forty ancient feet) in length, which includes the front porch's 3.8 m projection. The building has a width of 5.9 m (twenty feet), which equates to a ratio between length and width of 2:1. The foundation of the walls is cut out of bedrock and forms 0.45–0.55 m wide wall-bases. These rock-cut wall-bases form *antae* on both the front and the back of the building, very similar to the plan of the *cella* in the early Doric temple. Postholes along the upper surface of the wall-bases indicate that the upper parts of the walls were built using a wattle-and-daub technique.²¹⁰⁹ Four large postholes in front of the building indicate a projecting porch. Large postholes outside the *antae* on the building's rear reflect the large postholes in the porch, between which ran a horizontal wooden beam. Like the Villanovan hut, the interior of the house is recessed about 60 cm (two feet). On the even bedrock floor in the main room, river stones were placed along the three side walls forming beds with a width of ca. 1.25 m. No roof tiles could be associated with the Orientalizing hut phase. The roof material must have been thatch.

A similar rectangular hut was found at the Northwest Gate in Veii in 1957–58. It measures 11.40 x 5 m, and very closely reflects the size of House I in San Giovenale with its 2:1 ratio between the house's length and width. The pottery inside did not include bucchero, suggesting a date in the second quarter to the middle of the seventh century.²¹¹⁰

The best parallel to the Orientalizing rectangular hut is the contemporary Cer-veteri chamber tomb, the Tomba della Capanna.²¹¹¹ The main chamber of this tomb has a rectangular plan. The ceiling is convex and reaches almost down to the benches attached to the wall. The curved surface and the low-reaching roof suggest that the model for the roof material was thatch. The main room has benches running around the walls. The inner room has the same arrangement of benches, which were built with smooth river stones, just as at San Giovenale.

Conclusion

The development from a large oval Pro to-Villanovan hut placed in a cut channel—via the compact Villanovan hut with substantial wattle-and-daub walls—to the rectilinear hut of the Orientalizing period, built with traditional “hut materials” but on a new plan took about 500 years. In the second half of the Orientalizing period, terracotta roofs were introduced as well as quarried ashlar blocks in walls and foundations. With the Archaic period, Etruria abandoned its prehistory and entered the architectural *koine* of the Mediterranean world.

40 Handicrafts, 10th cent.-730 BCE

Abstract: This chapter illustrates the main fields of craft production in the area characterized by the Villanovan culture (Etruria and adjacent areas) from the points of view of typological and technological developments. The sociopolitical and economic framework is that of incipient or embryonic urbanization, the “proto-urban phenomenon,” that occurred between the late tenth and late eighth centuries BCE.

Ceramics include handmade vessels (chiefly biconical funerary urns and their lids) ornamented with geometric patterns in the Villanovan style, as well as more specialized vessels decorated with metal stripes. Only in the advanced Early Iron Age 2 (eighth century) were wheel-made ceramics introduced under the influence of immigrant Greek potters.

The best-known handicraft in Iron Age Etruria is bronze working, a productive field that encompasses a broad range of artifact classes and shapes. Indirect evidence from the study of artifacts attests to specific stages in the metalworking process, demonstrating a high level of specialization and complexity in the organization of labor. The great variability of formal features and techniques, and the different levels of elaboration in Villanovan bronze production are exemplified by cast objects, such as fibulae and weapons (swords), and by hammered items such as sheet bronze armor and vessels. Sheet bronze production is considered particularly representative of the high level of Villanovan craftsmanship and of the close connection between metalwork and the display expressions of new elites within the proto-urban communities. It is also pointed out how iron production, though giving the name to the period, did not become especially important in local economies before the mid eighth century. Other minor materials, especially amber, gained great importance in the framework of elite consumption and trade, which led to a highly sophisticated production of ornaments and symbolic items in the latest stages of this period.

Keywords: Levant, Central Europe, elites, pottery, bronze

1 Pottery

Our overview on craftworks in late protohistoric Etruria begins with pottery, which in quantitative terms is the main material category in the archaeological record. Generally speaking, and without a real distinction in technological and compositional terms, in Etruria of the ninth and eighth centuries BCE, pottery vessels principally comprised two classes of handmade *impasto* ware: coarse ware, including vessels for daily domestic functions, such as cooking stands, bowls, jars, and dolia (very large, wide-mouthed vessels without neck or handles)²¹¹², and a better-quality ware, encompassing a great range of ceramic forms from tableware to ritual paraphernalia. The latter class is generally made of a dark burnished *impasto*, fired under a reducing atmosphere.

In most cremation burials, and partly in non-burial contexts of the early

stages of Villanovan Etruria, mainly biconical cinerary urns and other related vessels (especially bowls with in-turned rims) can be found, with complex geometric decoration made by impression, incision, and stamp (Fig. 40.1.1–3); this ornamentation follows a limited range of variation which is universally referred to as the “Villanovan style.”²¹¹³ This class of pottery cannot strictly be considered workshop production, but rather should be labelled “semi-domestic” manufacture. Conversely, a more specialized character is revealed by pottery ornamented with metal sheets (mainly tin) applied to the sides using adhesives, employing a technique well known both north of the Alps and in Italy since the late second millennium BCE. A class of vessels ornamented this way, the *orcioli a lamelle metalliche*,²¹¹⁴ in all probability jugs or cups associated with the consumption of liquids, has mainly been found in the principal centers of southern Etruria as well as in Vetulonia and Populonia (Fig. 40.1.4); it shows recognizable formal regularities, in particular homogeneous patterns of decoration.

We possess only limited information regarding technological aspects of Villanovan ceramics: archaeometric studies are lacking, while a few data concern the use of temporary firing installations in the form of “pit-kilns,” though with an internal division into sectors.²¹¹⁵ Sometimes—for instance at Bologna—such kilns are vertically divided into a fire- and a cooking-chamber by using partition, perforated, floor;²¹¹⁶ this more sophisticated technical device might have improved the quality of the final result in terms of surface homogeneity.

Not until the early Phase 2 of the Iron Age do we see in southern Etruria the start of a much more varied pottery production. Specific issues are raised by the appearance of numerous drinking vessels of the Greek Middle and Late Geometric ware, mainly, but not exclusively, of Euboean production. The manufacture of the latter was promptly imitated by immigrant potters, giving rise to a new class of wheel-made painted tableware, including various types of *skyphoi* as well as other forms such as jugs and cups.²¹¹⁷ The introduction of wheel-made ceramics, though it did not really lead to “mass production,” was conducive to greater diversity in the pottery craft, influencing even the manufacture of the more widely consumed *impasto* pottery, which from the second half of the eighth century was becoming more standardized with the aid of the wheel.

2Bronze metallurgy

The scant evidence from Italian Early Iron Age settlements makes it very difficult to provide a clear picture of the spatial organization of metal manufacture sequences. This is particularly true for the vast so-called “proto-urban” sites, which were to develop into cities during the seventh century.

In southern Etruria, only the minor settlement of Gran Carro near Bolsena, dating around 900–850, has provided some evidence of small-scale metallurgical activities *in situ*²¹⁸ such as molds, bronze jets and droplets, and several finished objects made of bronze and lead. They point to the existence, even in minor sites like this, of local secondary production that ranged from tools to simple ornaments and fibulae.

Some findings from Felsina (Bologna) can help in reconstructing limited

aspects of the metalworking carried out in the proto-urban centers of Villanovan Etruria during the second phase of the Early Iron Age. In the eighth century, Felsina was a huge agglomeration containing several areas for different stages of metallurgical production²¹¹⁹. In this regard the most interesting, albeit indirect, evidence is the hoard recovered in Piazza San Francesco, which comprises nearly 15,000 bronze objects (and just three made of iron) deposited in a large jar around 700 BCE (but containing many objects from throughout the eighth century, and some that are older). This outstanding accumulation of metal objects includes more than 4,000 axes²¹²⁰ and many other tools, several fragments of weapons, horse gear, and sheet vessels. After the tools, quantitatively the most impressive of all classes is the fibulae, numbering more than 3,000 pieces. Particularly useful for the interpretation of this hoard are the copper ingots and the great array of scrap metal, which also includes far older objects (e.g. an Early Copper Age dagger of East European provenance),²¹²¹ especially unfinished bronze artifacts that had been thrown away and subsequently collected as waste products.²¹²² They evidence specific stages in the metalworking process, demonstrating a high level of specialization and complexity in the organization of labor. The ingots had been intentionally fragmented to form a stock for refining copper in the smelting process, while fragmented objects were probably intended for recasting. The latter procedure had great economic significance, because it allowed bronze craftsmen to recycle an already existing bronze reserve without the necessity of gaining new stocks of copper and tin.

2.1 Fibulae

In the field of metal ornaments and dress accessories, the main geographical areas in which the Villanovan culture developed show some common features and many local variations.

Bronze fibulae, found especially in female burials, were the most widespread metal items linked to clothing from Bologna to the Villanovan centers of Campania. The Villanovan workshops developed a particularly remarkable production of arch bow fibulae with a spiral catch-plate made by hammering (Fig. 40.2.1),²¹²³ which toward the end of Phase 1 was becoming solid, with complex incised decoration consisting of geometrical motifs reminiscent of the Villanovan style of contemporary ceramics (Fig. 40.2.2–3).²¹²⁴ The role of south Villanovan bronze workshops in improving and enriching the manufacture of fibulae with a disc catch-plate is also apparent from a specific class of fibulae with disc catch-plate and a composite bow with bronze graduated discs (Figure 40.2.1), or of alternating bronze/amber/bone discs (Fig. 40.2.2), whose shape resembles a leech.²¹²⁵ These kinds of fibulae, including a variety of specific local types, are widely distributed across southern Etruria and in the Villanovan centers of southern Campania

(Pontecagnano, and especially Sala Consilina), with more limited specimens outside

Fig. 40.2: 1–5. Bronze fibulae from Early Iron Age southern Etruria (1, 3 after Falconi Amorelli 1966; 2 after Hencken 1968; 4–6 after Cavallotti Batchavarova 1967)

It was during Phase 2 that the manufacture of bronze fibulae in Etruria and nearby areas saw remarkable growth in scale and quality. From the technological point of view, whole casting of the bow of the fibula to a great extent replaced hammering, at least as far as arch bow fibulae are concerned.²¹²⁶ The fibulae might have been cast using either *bivalve* molds with an internal terra-cotta core, or the lost wax technique. The result was a casting that was further refined through clearing, polishing, and the adding of incised and engraved decorations.

As demonstrated by observations of casting wastes from the San Francesco hoard at Bologna,²¹²⁷ this technique allowed metallurgists to create two fibulae at a time and to reuse the same core for several additional castings of

hollow pieces. A rarer technique, not recognizable from simple naked-eye observation of finished objects, was lost wax casting, which was particularly suitable for pieces including plastic or deeply engraved decoration.²¹²⁸

Such techniques, except the lost wax technique that yields single pieces, greatly enhanced the speed and economic effectiveness of manufacture, allowing development toward a sort of mass-production of fibulae. At the same time, craft intensification and quantitative increase in producing these daily items were complemented by a tendency toward experimentation and inventiveness that was, in turn, favored by the start of processes of centralization within incipient urbanism. Indeed, at the transition between Phase 1 and Phase 2, the bronze workshops of Etruria seem to have elaborated new forms of fibulae that would be widely appreciated in the subsequent Orientalizing period throughout Italy and beyond, the “leech” bow fibulae. Beginning in the middle of Phase 2, their manufacture, with either a solid or a hollow bow, was particularly abundant and varied. They include complex decorative patterns showing panels with zigzags and concentric circles that were for the most part made before casting, with the aid of tools such as gravers or punches (Fig. 40.2.4–6). The manufacture must have been in series, as indicated by the numerous sets of fibulae of varying size but with identical or very similar shape and decoration.²¹²⁹

2.2 Bronze swords

Another important category of metallic production in Villanovan Etruria is bronze swords. Among the large class of flange-hilted swords (Ger. *Griffzungenschwerter*), Early Iron Age Etruria especially adopted the “Italic” T-hilt swords, very short weapons whose general shape derives from types of Late Bronze Age date.²¹³⁰ During the late Phase 1 and early Phase 2, “Pontecagnano” type swords played a special role. Found especially in southern Etruria (Tarquinii, Vulci) and Pontecagnano in Campania, these weapons have a triangular blade with fine incised decoration and in most cases were accompanied by finely decorated bronze sheaths (Pontecagnano type sheaths), a feature almost exclusive to the “Italic” flange-hilted swords (Fig. 40.3.1–3).²¹³¹ As a rule, the front face of these objects presents incised figural scenes, representing in the main field a man armed with a lance in the act of hunting various animals, such as red deer or boars (Fig. 40.3.2–3). According to Patrizia Gastaldi,²¹³² the Pontecagnano swords and the associated sheaths are to be attributed to a workshop located at Pontecagnano itself, where the earliest example of this type is documented.

2.3 Sheet bronze working

Sheet bronze manufacture, including highly elaborate objects made of laminated bronze, such as elements of armor, belts, and prestige vessels, is no doubt the most developed and distinctive craft category in Etruria and nearby regions during the Villanovan period. A point worth considering is that this kind of craft requires complex division of labor and the existence of a wealthy elite to be fully supported. Because of the high skill level, the remarkable time consumption, and the substantial quantity of raw material that this craft requires, the sheet bronze industries in Early Iron Age Italy chiefly emerged in situations of rapid upsurge of proto-urban centers, especially in southern Etruria and at Bologna, with increasing intensity beginning in the eighth century.

In the late tenth and the ninth centuries, prior to the introduction of bronze shields and breastplates, the helmet was the only category of metal armor known in Etruria and throughout Italy. The earliest examples of bronze helmets, found at Tarquinii and Populonia, dating to both early and late Phase 1, are akin to the central European class known as *Glockenhelme*, or *glockenförmige Helme mit gegossenem Scheitelknauf* (rounded bell helmets with cast knobs; Fig. 40.3.4).²¹³³ Much more sophisticated was the production, by the latest part of Phase 1, of hemispherical bronze helmets, entirely covered with rich geometric decoration (Fig. 40.3.5). Strictly speaking, they should be considered ceremonial headgear for outstanding individuals rather than defensive armor. The decorative patterns, organized into square or metope-like panels, include a mixture of Sun-ship bird motifs that belong to the Late Bronze age iconographic repertoire (see [chapter 44](#) Iaia), and other cultic symbols, such as the solar disk, and were created with repoussé and stamp techniques.

Fig. 40.3: 1. Pontecagnano type sword, from Pontecagnano; 2.-3. Pontecagnano type sheaths from Pontecagnano and Tarquinii; 4. Round bell helmet from Populonia; 5. hemispherical helmet from Tarquinii (1.-2. after Gastaldi 1998; 3. after Hencken 1968; 4.-5. after Iaia 2005)

The most refined of all types of armor in Etruria were the bronze crested helmets with pointed cap,²¹³⁴ which are probably an innovation by the Villanovan metalworkers of southern Etruria (Fig. 40.4.1–2). From the beginning (possibly around 850 BCE), they were constructed by overlapping two separate halves made of sheet bronze and riveting them together. Elements intended to hide the fastening-points, such as the two rectangular plates with protruding false rivets placed on the forehead and the back, were transformed into ornamental additions; some workshops, probably at Tarquinii, would decorate them with stamped ornaments in the form of concentric circles.²¹³⁵ In the course of time, apparently during the eighth century, the embossed decoration on the cap and crest developed from simple geometric patterns to a sort of “baroque” style, with the addition of stamped circles symbolizing the sun (*Ring-buckel*) and the inclusion of the iconography of the Sun-ship bird (Fig. 40.4.2).²¹³⁶

The second most important element of armor in Villanovan sheet bronzecraft was the shield, which was especially intended for ceremony and display. The first type to appear was the “double-eight” or *Ancile* shield, known in only a few exemplars, from Norchia, Veii, and Bisenzio.²¹³⁷ It consisted of two separate round shields linked together by a third long sheet, using a complex fastening system. All the elements were richly decorated with repoussé ornaments resembling those of the crested helmets, and accompanied by round breastplates decorated in the same way.²¹³⁸ Around 800–770, simple round shields made of a single sheet of bronze appeared, as a rule decorated with embossed ornaments (Fig. 40.4.3). This innovation was accompanied by the increased development, especially during the second half of the eighth century, of large decorated items (up to 0.90–1.00 m in diameter) of exceptionally thin (ca. 1 mm) bronze sheets. They became the most typical symbols of power in warrior burials of the eighth century. Their manufacture seems to have been concentrated in southern Etruria, but the distribution of identical examples over a wider area, including Verucchio north of the Apennines, points to the existence of traveling smiths who brought the technique far from the original source.²¹³⁹

Fig. 40.4: 1–2. Bronze crested helmets from southern Etruria; 3. bronze shield from Veii, tomb Quattro Fontanili AA1 (1–2 after Iaia 2005; n. 3 after Franco et al. 1970)

The first bronze vessels of Villanovan manufacture can be found in the ninth century. They are numerically limited, though technically remarkable; they include ceremonial vessels such as small cups, conical bowls, and incense burners. Around 800 BCE or slightly earlier, the hammered bronze products of southern Etruria and Bologna improved considerably in quality and elaboration of manufacture. Stillfried-Hostomice cups (Fig. 40.5.4), great cinerary urns of biconical shape (Fig. 40.5.1), and necked amphorae on a

Central European model appear in wealthy burials of members of the proto-urban aristocracy.²¹⁴⁰ These vessels were ornamented by embossing with elaborate patterns including “bird-boats” and solar motifs (Fig. 40.5.1–2), such as we have already seen in hemispherical and crested helmets; they mark the progress of metalwork toward a level of quality never attained in earlier phases (at least in continental Italy).

Around the decades 760–720, stamped motifs made by punching were becoming more widespread in the production of laminated bronze in southern Etruria. Sometimes these elements were organized into concentric patterns to adapt them to the shape of the decorated item.²¹⁴¹ Workshop manufacture began in this area. It included different classes of artifacts, from armor to vases, linked to consumption by a fully developed aristocracy. In particular, some highly specialized workshops located at Veii and Vulci produced shields, belts, and vessels (necked amphorae, flasks: Fig. 40.5. 6–7), all decorated with stamped motifs representing horses.²¹⁴²

Another important category of sheet bronze objects, elliptical belt plates, has its origins in southern Etruria.²¹⁴³ These are fine elements of jewelry, found as part of the ceremonial clothing in wealthy female grave-groups throughout Phase 2, especially at Veii, Tarquinii, Vulci, and to a lesser extent at minor centers. A different product, though closely connected to southern Etruria, is known during the eighth century at Felsina and Verucchio, from where it was probably later transmitted to some areas of northern Italy.²¹⁴⁴ Very specific to these objects is the ornamentation, including mainly figural motifs and geometric frames, which were realized principally by engraving and secondarily by embossing (Fig. 40.7.1). They follow a rigid decorative scheme that can be seen as a clear cosmological representation, according to traditional Urnfield iconography: nine relief bosses in the middle of the belt are flanked by bird-boat motifs or, more likely, by allusions to the wagon of the sun pulled by birds, a fact also highlighted by the use of solar elements ambiguously referring to wheels.

Fig. 40.5: Bronze vessels from burial contexts of southern Etruria, Early Iron Age phases 1–2 (after Iaia 2005)

3Iron metallurgy

Contrasting with the use of bronze, the Early Iron Age in Italy cannot be defined properly as an “age of iron” before late Phase 2, or the eighth century. This is particularly true in Etruria, a region with plenty of metal resources in its northern-central portion; in fact, at the moment there is no clear evidence

of systematic working of the famous deposits of iron ore on the island of Elba near the coast of Tuscany, at least before the seventh century.²¹⁴⁵

During the Early Iron Age Phase 1, iron objects in Villanovan contexts are very restricted, although with variable numbers per site. In Etruria proper, the only center with adequate evidence is Tarquinii,²¹⁴⁶ where iron objects belong to two categories, serpentine bow fibulae of the “Sicilian” or “southern” type (Fig. 40.6.3) and swords, suggesting a close link of this material with manifestations of male status. The iron swords are mainly of the “Italic” T-hilted shape akin to many bronze examples (Fig. 40.6.2), and a similar situation can be detected at Pontecagnano in southern Campania.²¹⁴⁷ By contrast, the other important Villanovan center of southern Campania, Sala Consilina, where swords and fibulae could frequently be made of iron, seems more influenced by the Oenotrian area (Calabria and Basilicata).²¹⁴⁸ Hence, at the beginning of the first millennium BCE, across most of Italy (maybe with the exception of Calabria) iron was employed chiefly as a precious and unusual material, and the quantitative scale of its impact on local exchange systems and economy was weak.²¹⁴⁹ Artifacts tended to imitate the shapes of the dominant bronze objects and were probably manufactured by bronzeworkers.

This situation was partly reversed during the decades 770–720. From this period on, the wider adoption of iron weapons (mainly spears, daggers, and knives) seems to be strictly linked to the emergence of a complex military organization, as is suggested by the different combinations of weapons in burials.²¹⁵⁰ This was, possibly, a much more effective response to the growing importance of warfare and concerns for territoriality. Furthermore, there are important indications that during the eighth century the role of iron was becoming pivotal in the practical and economic fields too. An interesting novelty was the spread of iron tools, such as knives, chisels, and axes,²¹⁵¹ documented in some male and female burials, particularly in Campania around 750–730. There, most tools and offensive weapons were made of iron, even reflecting cultural influences from the southernmost peoples of Italy²¹⁵² and from the Greek immigrants.

Fig. 40.6: 1. Bronze belt from Veii; 2. iron sword with bronze sheath from Sala Consilina; 3. iron serpentine fibula from Tarquinii (1. after Bartoloni and Pandolfini 1972; 2. after Kilian 1970; 3. after Hencken 1968)

40Other materials

Although the bronze metallurgy of Early Iron Age Etruria has attracted most of the interest of scholars, other materials attested in burial contexts deserve attention. They can be labeled “precious materials,” connected to long-distance trade and highly specialized production, and their consumption took

place mainly in the context of elite display. Gold objects are very rare in early Villanovan burials: from ninth-century southern Etruria a few solid gold fibulae, and more common bronze fibulae wrapped with gold wire, are known.²¹⁵³ Much more widespread are bronze items gilded with golden foil, such as the circular sheet pendants called *bullae*, a kind of ornament well attested in female and child burials of the late ninth to the eighth centuries especially at Tarquinii and Veii.²¹⁵⁴ The same technique was used in manufacturing the thin geometrical bronze sheets, gilded with gold leaf and provided with embossed decoration, found at Tarquinii in the wealthy warrior tombs Impiccato 1 and 2: their function was evidently the lavish decoration of an element of clothing.²¹⁵⁵ It was not before the second half of the eighth century that more elaborate gold objects, such as beads with granulated decoration and serpentine or draco fibulae, were manufactured, under the increasing influence of Oriental metallurgical traditions.

It is impossible to completely understand the significance of amber in the Iron Age without considering its enormous importance as the exotic material *par excellence* during the preceding period, the Bronze Age.²¹⁵⁶ After some decades of decreasing imports of raw materials and production of amber ornaments, following the abandonment of the main Late Bronze Age transit point for the amber trade in Europe, Frattese di Fratta Polesine (Veneto), this material again assumed a considerable role toward the late ninth and especially in the eighth century during the emergence of proto-urban centers in Etruria and adjacent areas. The northern center of Verucchio, in Romagna, has universally been considered the main mediator of the north Adriatic amber trade in Italy in the Early Iron Age, although its most substantial manufacture of amber objects did not start before the mid eighth century.²¹⁵⁷ Previously, some innovative amber workshops were located in southern Etruria, for example at Veii,²¹⁵⁸ where since the start of Phase 2 some fibulae with a disc catch-plate had had the leech-shaped bow assembled from amber and bone segments, sometimes with gold inserts.²¹⁵⁹ During the same century, the repertoire of amber elements in very complex necklaces for women, complemented with metal and glass items, was becoming much more varied: it included not only simple beads, but also more elaborate forms, such as drop and trapezoidal pendants, animal and anthropomorphic figurines, etc.²¹⁶⁰

During the second half of the eighth and the early seventh centuries, Verucchio may have emerged, though only for a brief period, as the most important center for manufacturing amber objects in Europe. Judging from the rich funerary evidence, their local consumption was not restricted to the higher echelons of society. They included a wide range of elements, from items for individual adornment made entirely of amber to ornamental additions on metallic and pottery vessels, bronze weapons, horse trappings, and various symbolic tools.²¹⁶¹ The only Etruscan center which in the same period appears to match Verucchio in this field is Vetulonia.²¹⁶² A major contribution of the Verucchio workshops, from the technological point of

view, seems to have been the introduction of carved amber objects, such as openwork pectorals and spindles. Furthermore, quite typical of the same workshops is a great variety of exceptionally elaborated multi-material fibulae, including many kinds of insertions, with painted internal decoration as well (Fig. 40.7.).²¹⁶³

Abstract: The Early Iron Age (EIA) protourban centers of Etruria were formed nearly at the same time, and in relation to each other. Accompanying their formation was the development of a common culture, which is best known archaeologically from the funerary ritual and style of tomb goods in the “Villanovan” cemeteries. The most significant and common cultural feature of the so-called Villanovan archaeological facies is the cinerary urn with high convex neck and rounded shoulder, and with a well-delimited range of comb-incised geometrical decorations. The urn is usually covered by a bowl, or, in a part of the male graves, by a helmet-shaped pottery lid. It is not a coincidence that the highest occurrence of this ritualistic/stylistic “code” has been found at Tarquinia, probably the epicenter of the protourban and “Villanovan” revolution (in consonance with the complexity of the topographic organization, and also with some Etruscan legends, like those regarding the national heroes Tarchon and Tages). In some way, the Villanovan cultural koine—albeit not precisely a unitarian culture in every respect—foreshadows the construction of a new identity, in connection with the radical geopolitical reorganization that determined the birth of the major communities of Etruria.

Keywords: Iron Age Etruria, protourban communities, process of urbanization, early Rome

1The protourban communities and the Villanovan cultural *koiné*

The Early Iron Age (EIA) protourban centers of Etruria were formed nearly at the same time, and in relation to each other.²¹⁶⁴ Accompanying their formation was the development of a common culture, which is best known archaeologically from the funerary ritual and style of tomb goods in the “Villanovan” cemeteries. The most significant and common cultural feature of the so-called Villanovan archaeological facies²¹⁶⁵ is the cinerary urn with high convex neck and rounded shoulder, and with a well-delimited range of comb-incised geometrical decorations (metopae or N-motifs on the shoulder, and meanders or triangles on the neck).²¹⁶⁶ The urn is usually covered by a bowl, or, in some of the male graves, by a helmet-shaped pottery lid.²¹⁶⁷ It is not a coincidence that the highest occurrence of this ritualistic/stylistic “code” is to be recognized at Tarquinia²¹⁶⁸ (Fig. 41.1), probably the epicenter of the protourban and “Villanovan” revolution (in consonance with the complexity of the topographic organization,²¹⁶⁹ and also with some Etruscan legends, like those regarding the national heroes Tarchon and Tages). In some way, the Villanovan cultural koine—albeit not precisely a really uni-tarian culture in every respect—foreshadows the construction of a new identity, in connection

with the radical geopolitical reorganization that determined the birth of the major communities of Etruria.

Fig. 41.1: Sample of villanovan cinerary urns from the cemetery of Le Rose at Tarquinia, showing a significant stylistic convergence (after Iaia and Pacciarelli 2012)

The development of protourban sites in Etruria had its origins in later Final Bronze Age (FBA phase 3),²¹⁷⁰ and really took off at the beginning of the EIA. This process also influenced events in other regions. In Campania, the three great EIA centers of Capua,²¹⁷¹ Pontecagnano²¹⁷² and Sala Consilina²¹⁷³ seem to have been directly inspired by the “Villanovan” model, not only in terms of material culture (although they have their own versions of main artifact classes, which implies that they were strongly rooted in local traditions), but also at least in part in terms of their size (though there are some differences, to be seen in the presence, in the first phases, of some distinct settlement areas).

A high demographic consistency may also be deduced for Bologna.²¹⁷⁴ In the first phase of the EIA, the population was distributed in some distinct villages, each with its own necropolis. During the second phase, around 750 BCE, an enormous (180 hectares) fortified center was founded, marking the beginning of the urban community of *Felsina* (modern-day Bologna).

Other communities outside Etruria showing clear Villanovan features—especially in the earliest phases—are Verucchio,²¹⁷⁵ near Rimini, characterized in the decades around 700 BCE by a richness likely tied to its control of the amber trade, and of Fermo,²¹⁷⁶ in the Marche region.

2Revolutionary social, economic and political changes between the FBA and EIA, connected with the formation of protourban centers

Unfortunately, we know relatively little of the FBA necropolises. It seems that in Etruria, however, at least from FBA phase 3, the cemeteries have groups of tombs containing both male and female burials (e.g. in the cemetery of Poggio della Pozza at Allumiere, on the Tolfa Hills), and perhaps already representing family groups. At the same time a major role has been played by warriors, marked in Etruria by the common use of helmet-shaped pottery urn lids.²¹⁷⁷

This evidence from the FBA is sparse but suggests that the communities were in flux before the development of protourban societies. Such a transition must have been the product of changes over a long period.

Developments during the Bronze Age include the formation of a warrior elite as well as a more general process of economic change—clearly visible, for example, in agricultural and craft production—linked to the activity of the productive classes. This is evident within communities in which the traditional links based on extended kinship, reciprocity and “tribal” egalitarianism must have been weakened by the development of new forms of economic exchange based on weighed metal, individual accumulation, and relationships of subordination cultivated by the emerging elites.²¹⁷⁸

The modification of the economic structure was interwoven with changes in

sociopolitical relations that were linked to developments in warfare and related activities.

Unfortunately, the data for this are scarce. However, considering the data for peninsular Italy, during the course of the FBA, the diffusion of long spearheads is linked with a progressive shortening and decrease in the importance of the sword, which presupposes the transition to a form of combat based on ranks of warriors with spears.²¹⁷⁹ While individual skills and knowledge were still important, this type of combat placed a premium on group coordination and organization.

A number of elements provoked a spiral of changes, some gradual, some probably “revolutionary.” These elements included 1) the emergence of increasingly complex families (probably because the families began to contain members in subordinate positions) with greater autonomy and productive capacity; 2) tensions over access to land; 3) political and military organizations ideologically based on equality and the inclusion of a wide sector of the population and various communities; 4) the resulting transformations in the nature of power, which increasingly tended to be more shared and “public”; and the ideological implications of this.

This socio-political restructuring—dating to the later FBA and crystallizing with the beginning of the EIA—led to a marked weakening or cancellation of the residual privileges and “personal” powers of the previous elites, and to the formation of societies entirely structured around the community of the warriors, the *populus* (as it was called in ancient Rome). The warrior class was organized in egalitarian groups, presumably at least in part via forms of political collegiality, and via associations of intermediate level between the individual household and the protourban community. A subdivision of the latter into minor groups is demonstrated by the existence of several cemeteries, often characterized by a specific identity in the ritual.²¹⁸⁰ These groups, constituted by several families, are probably something similar to the *curiae* of early Rome. These were fundamental social units, responsible for assuring the military recruitment, the organization of the assemblies (Lat. *comitia curiata*), and probably also the framework of economic cooperation necessary for the flourishing of the warrior class.

Some of the changes described above also took place in other regions. In Calabria, significant new settlements were established, such Torre Galli, which is situated on the edge of the Poro plateau, a location that allowed direct access to arable land and control of maritime trade routes. At the cemetery of Torre Galli, dated to the phase 1 of the EIA, we see the clearest new organization, based on the widespread diffusion of the role of warrior in the male population, and on the generalized use of the spear.²¹⁸¹

The main epicenter of the protourban development was southern Etruria, partly because of its abundant natural resources and favorable geography. Possibly already in the FBA, trade, economic, political and military processes existed, focused on sites such as Tarquinia and Vulci. These are situated on

large plateaus near river mouths on the Tyrrhenian coast, an area that from the FBA developed long distance maritime trade involving Sardinia.²¹⁸² Already by FBA phase 3, but especially in the EIA1, there is evidence along the coast of the intensification of the production of salt or salted goods.²¹⁸³

Changes in the forms of use and possess of the land may also be hypothesized. According to Renato Peroni and Giovanni Colonna,²¹⁸⁴ it has been thought that the “extensive” occupation of these protourban centers in Etruria (on large defensible and cultivable plateaus) could have been linked to the allotment of each landowner’s land.²¹⁸⁵ However, it is obvious that these lots, like the *bina iugera* of early Rome, must have been quite small, being sufficient only for basic subsistence. They were, therefore, integrated by the lands (probably partly private and partly public) in the surrounding territory.

3Evidence from the Villanovan cemeteries in the first phase of the Early Iron Age (EIA1)

Analysis of the types of interments and of the spatial arrangement of the Tyrrhenian EIA1 cemeteries allow us to reconstruct some of the main aspects of social structure.

The clearest and most generalized distinction is that of gender. The male graves contained a razor and signs of a warrior role, including weapons (mainly a spearhead and, more rarely, a sword) and sometimes defensive (or symbolic) armor, like the frequent helmet-shaped pottery lids. These elements are never found in the female graves, which instead contain utensils tied to spinning (pottery spindle-whorl and sometimes bronze spindle or distaff) and weaving (bobbins), and several types of ornaments. The most common are fibulae (those with a serpentine bow are only common in male tombs), hair coils, necklaces (with beads made of glass, amber, metal, stone, bone, etc.), and bracelets (which are sometimes also associated with men).

The differences in wealth and rank—emerging mainly in later phases of the EIA—are signaled for the men by complex weaponry (sword, and especially bronze helmet, and later pectoral and shield); for the women by precious ornaments (in amber, gold and silver) and a bronze girdle; and for both genders by metal vases, horse bits and chariot parts, metal spits and firedogs, and precious amulets (often of *faïence*).

In some cases, the funerary area is structured as a single unit, not clearly divided into separated family groups, as it seems at Tarquinia-Villa Bruschi, an important cemetery almost wholly excavated by Flavia Trucco. In this case, the social unit reflected in the cemetery was probably something similar to a Latin *curia* or to a Greek *ghenos*.

In other cases, we clearly see a division of the funerary space into small clusters of tombs, clearly relating to families. Inside these, there is usually a

couple of tombs—one female and one male—with more significant grave-groups. When these clusters last for more than one archaeological phase, it is possible to recognize a principal couple for each phase. This is the case of the burial group of Bisogno at Pontecagnano. At this site there is a principal male tomb for each phase—the earliest phase IA features a razor; the latest IA features a helmet-shaped pottery lid; IB features a sword—and also one or two female graves with a *parure* of ornaments more complex than average.²¹⁸⁶

In some cemeteries, we see small family clusters put together to form a larger group (an extended family or a descent group similar to a *gens*?), such as the two large collections of tombs in the Sant'Antonio cemetery at Pontecagnano.²¹⁸⁷ In this case there is only one tomb with a sword per major group.

The cemetery Le Rose at Tarquinia of the phase 1 of the EIA, also contains family clusters, each centered on a pair of tombs placed close together. There is a male tomb with a pottery helmet (often also with a stone receptacle and small vases) and a female tomb with a more-complex-than-average set of objects (spindle whorl, hair coil, and one to three fibulae)²¹⁸⁸.

The transition to a social structure in which the family unit began to play a key role happened simultaneously with the geo-political restructuring at the beginning of the EIA. At this stage, the family structure is generally complex and already similar to the *familia* or *oikos* of the historical period. Renato Peroni sees this as an important transition, and one that is characteristic of his *protourban communities*.²¹⁸⁹

4Signs of a hierarchy at the beginning of the Iron Age at Tarquinia and other protourban centers

The existence of a complex politico-military hierarchy is to be recognized at Tarquinia, where all the most complex tomb-groups of EIA1 come from the necropolis at Arcatelle. The richest male tombs comprise signs of high politico-military status, such as the bronze helmets—three with apex and one of the crested type—along with horse bits in one tomb, and in another case sword, spearhead, bronze vases and fibula with wrapped gold wire (Fig. 41.2). Two complex female burials of EIA1 from Arcatelle yielded particular metal vases. In one of these grave-groups there is an exceptional symbolic bronze wagon (Fig. 41.3—certainly a cult item—in the form of a horned bird (another horned head is on the lid), and in another a silver pyxis. The latter grave is also rich in ornaments, comprising forty-one fibulae (one of which is made of gold), a number never found in EIA1 graves, and an amber and glass necklace. These data indicate that the Arcatelle cemetery, at least in EIA1, must have been used by the leading group—a chiefly *ghenos*?—in the

community.²¹⁹⁰

Other Villanovan centers may also have had a similar hierarchy. At Populonia, for example, the high status tombs are circular dry-stone chambers under tumuli; the tomb-goods from one included two bronze helmets.²¹⁹¹

Fig. 41.3: Tarquinia, cemetery of Arcatelle: exceptional ritual bronze vessel from a female tomb of the first phase of Early Iron Age. (after Hencken 1968)

5Development of a stratified society during the second phase of the Early Iron Age (EIA2)

The development of different levels of wealth and rank began with the formation of the protourban centers, and accelerated sharply during EIA2, as can be seen by the different categories (Figs. 41.4–6) of tombs from the cemetery of Quattro Fontanili at Veii.²¹⁹² The tombs not only reveal “horizontal” divisions by role and gender, but also marked “vertical” distinctions of social rank. The latter includes individuals of both genders and all age classes from elders to infants, and thus social status during EIA2 seems to have been regularly acquired via inheritance.

The males of the highest rank are represented by the category of *corredo A*, subdivided in the two sub-categories: A1 and A2. In the burials of the first,

there are a sword and a pair of spearheads, along with prestige objects like metal vases, spits— obviously tied to the sphere of the meat-based banquet— and often a pair of horse bits and sometimes also pieces of a chariot). Burials of the second category is composed mostly by infants and young males, buried with a small spearhead and some prestige items similar to those of A1 graves.

Fig. 41.5: Veii, Quattro Fontanili necropolis (mainly EIA2): high rank female grave-groups. A: t. KK10–11, aged 25 (category B); B: t. JJ17–18, adult and child (category C); C: t. EE 7–8B, aged 3–4 (category D) (after Pacciarelli 2001)

Fig. 41.6: Veii, Quattro Fontanili necropolis (mainly EIA2): low rank grave-groups (A-B, males; C-D: females). A: t. Z9, aged 15–19 (category E); B: t. GG14–15, aged 1 (category F); C: t. JJ8, aged ca. 50 (category H); D: t. KK13–14, aged 3–4 (after Pacciarelli 2001)

The most complex male *corredi* comprises two chiefly burials: tombs AA1 and Z15A. These are characterized by a sheet bronze cinerary urn and other metallic vases, a crested helmet and other exceptional pieces of bronze armor, like a shield in AA1 and a pectoral in Z15A, along with many other prestige items. Because of their high status—and considering the different chronology (Judith Toms’ phase IIB for AA1, IIC for the other)²¹⁹³—these males were likely chiefs of the whole community (*ghenos* or *curia*?) that used the Quattro Fontanili cemetery, during the middle decades of the eighth century (approximately between 790/770 and 740/720 BCE).

High-ranking adult females (category B) have *corredi* including thread spools, amber necklaces, gold and silver ornaments, bronze girdles, distaff and vases, and sometimes horse bits. The mostly female high-status infant graves (category D) have a spiral bracelet and personal ornaments, which are sometimes precious and in large quantities.

Actual weapons are thus a mark, from birth, of the males of this dominant social group—undoubtedly the emergent Etruscan aristocracy—which

represents itself as the interpreter of the warrior values of the *populus* (in late Etruscan language *rasna*)²¹⁹⁴ and further distinguishes itself by a lifestyle linked to the values of the meat-centered feast, ownership of horses and the use of chariots. All of this requires wealth, which would have come from exploitation of local land and resources, especially areas some distance from the settlement, in some way corresponding to the *agerpublicus* (from *poplicus*, i.e. “of the *populus*”) of ancient Rome. The *ager publicus*, which was appropriated rather than properly owned, formed the basis of the aristocratic families’ wealth over a long period.²¹⁹⁵

The thread spools found in rich female tombs of combination B are further proof of the source of this wealth: wool and/or linen. These tombs not only exalt the domestic values associated with spinning and weaving, but also contain many high prestige goods such as amber necklaces, and bracelets etc.; items which also occur in several category D infant tombs.

The second level of social rank is represented by adult males generally buried only with a razor and/or pottery urn cover in the shape of a helmet, and a serpentine fibula (category E), and probably also by male children with serpentine fibula (category G) or serpentine fibula and knife and/or small metal point (category F). The adult women of this rank have a single spindle whorl and some fibulae (category H), and the babies have only a certain number of beads, mainly of glass (category I).

A third rank—perhaps of servants or dependent laborers— is also represented by some graves, in which were placed very poor *corredi*, consisting only of pots (category K) and sometimes a few beads (category J).

Evidence for the organic formation of high-ranking groups, at least from the beginning of EIA2, comes from the spatial arrangement of the Quattro Fontanili cemetery. Some areas have concentrations of tombs of the highest-ranking individuals— both males and females of various ages—close to which lie tombs of lower-ranking males and females.

The Veian cemetery of Casale del Fosso,²¹⁹⁶ mainly dating to EIA2, is also spatially arranged into groups, apparently belonging to extended families. Each group contains a single tomb whose goods include a sword, and various burials either with a spearhead or necklace and bracelet.

The forms of ostentation of rank and wealth described above were made possible by the economic success of the “Etrurian system,” and of Veii in particular. They can be seen as the outcome of competition and the differential accumulation of goods by different family groups, as well as the concentration of authority and power in the hands of the heads of the richest extended families (*patres familias* according to Roman terminology). These are probably the men with A1 tomb goods, while the children buried with weapons and the women and babies of categories B and D must be their close relatives.

The political importance of a certain number of *patres* (probably those directly descended from the original heads of the extended families) may have

partially led to the concept and practice of private rights over what was originally public land. At first, such rights would have been impermanent, but gradually became consolidated until finally the community permanently lost control of the land.

One of the motors of the rapid and growing socio-economic transformation of EIA2 was undoubtedly also the flourishing of trade and exchange fed both by the enormous protourban sites, obvious places for “permanent” markets and craft production, and by the elites demand for prized goods. The increase in production and exchange of goods was certainly aided by the activities of the Greeks and Levantines in the Tyrrhenian area, especially with the foundation of Pitheculae in Campania. However, Pitheculae was not founded until later in EIA2, after the beginning of these socioeconomic changes, which therefore must have had a local origin linked to indigenous developments in social structure.

The rapid evolution of protourban societies with complex organization is well testified by the development of a further and uppermost social group. This dates from the EIA2 phase, but only reached maturity at the end of this period. The wealthiest tombs of Quattro Fontanili belonged to this small social group, among which were the aforementioned male tombs AA1 and Z15A (Figs. 41.7–8), and female tombs which from phases IIB-IIC contain exceptional quantities of prized goods. Two of these were tomb EE7–8B, which contained belongings of a young female child, and Yalpa2197 of phase IIC, whose location close to AA1 may be not accidental.

The process of emergence of a princely class, common to various protourban communities, reached its culmination at the end of EIA2—that is to say at the beginning of the Orientalizing period—with the appearance of very high-ranking burials such as the Tomb of the Warrior at Tarquinia.²¹⁹⁸ From this very rich *corredo* come not only complex weaponry and many prestige items (horse bits, several bronze vases, and precious metal vases and fibulae) but also an exceptional sign of a very high politico-military role: a large pectoral with a richly ornamented gold plate.

Tiziano Trocchi

42Ritual and cults, 10th cent.-730 BCE

Abstract: Funeral practices in the ancient proto-urban communities in Etruria are characterized by an early predominant use of cremation, which was later replaced by burial between the late ninth and eighth centuries BCE. Particular attention was initially paid to avoid mutual dependences and inequalities that led to funeral rituals with strong egalitarian traits—burials within extremely simplified structures and with few grave goods. The initial rigor of funeral rituals was gradually replaced by more complex ritual ceremonies, which show the early emergence of an embryonic social stratification.

With the transition to the advanced stage of the Early Iron Age, there was a general increase in the size and articulation of burial spaces. Individual characterization of the deceased is more and more increasing. The anthropomorphism of the urns became a typical mark of elite cremation burials, and can be connected to the need to restore individual role and social status. In the final stage of this period, funeral practices were increasingly linked to the self-affirmation of an aristocratic group of people at the top class of the social hierarchy. The leading figures of this social class represented themselves through attributes that show their military, religious and political prerogatives.

Among the few data about ruins of worship structures, the most famous are those of Pian della Civita in Tarquinia, where the finds of food offerings are reminiscent of female fertility cults, while two burials—which were certainly consecrated to the gods—suggest the practice of cruel and sacrificial rituals. In the number of worship tools found in funerary contexts, we have to mention the multiple-container vases, whose function can be related to the offering of preparation of food and beverages during religious ceremonies. Among the figurative documents with sacred value we remember in particular the plastic decoration on the bronzed cinerary in woman's grave 22 in Olmo Bello necropolis in Bisenzio, interpreted as a sacred dance around a monstrous death god, performed by a group of warriors, probably on their return from war. These features give origin to a complex cultural view, in which the emerging elite seem to wish to claim a privileged relationship with the underworld gods and with the divine forces governing nature and fecundity as a guarantee of social and political stability.

Keywords: Early Iron Age; funeral rituals; cremation burials; religious practices; worship tools; social status

1Funeral Ritual

1.1.The initial stages

Funeral events and practices in the ancient proto-urban communities living in Etruria are characterized by an early predominant use of cremation, which was later replaced by burial between the late ninth and the eighth centuries BCE.

Burial became increasingly dominant—especially in Southern Etruscan and Campanian necropolises—already in the eighth century. In contrast, cremation remained in use longer in northern Etruria and across the Po valley, where burial appeared only during the seventh century.

As for the meaning of cremation in relation to the concept of afterlife, we can emphasize that cremation in itself was considered a medium with a strong significance for the rite of passage, particularly by the change of the defunct physical state. This change may involve the concept by which the deceased is accepted into a different world, detached from the living one, where he/she becomes completely devoted to the gods.²²⁰⁰

The early spread of cremation in Etruria has been linked to funeral customs of the Late Bronze Age communities. We can assume that during the transition between the two phases, the origin of great proto-urban communities has led to a redistribution of agricultural resources in the hands of individual family groups.²²⁰¹ Particular attention was initially paid to avoid mutual dependences and inequalities between those groups that led later to funeral rituals with strong egalitarian traits that included strict rules for body treatments, and burials within extremely simplified structures and with few and selected grave goods.

Le Rose necropolis in Tarquinia, which can be dated to the ninth century, is an example in which we can find this kind of ritual. The graves appear to be arranged in small groups spanning a maximum of two generations, without any real unit linked to hereditary lines²²⁰² and with very few indications on family and social roles.²²⁰³

Even during the earliest phases, and due to rapidly changing social dynamics, the initial rigor of funeral rituals has been gradually replaced by more complex ritual ceremonies, which show the early emergence of an embryonic social stratification.

In this regard, we have to examine as a first step the actual tomb structure. The graves of the first phase do not initially have any clear distinctive sign in their structure, which was usually made from a simple circular pit-tomb, and which housed the jar of ashes, represented by the typical ceramic biconical vase. However, a more attentive analysis of some cemeteries led to the observation of some more elaborate tombs beside the other simpler grave structures. In some southern Etruscan places,²²⁰⁴ there is documented evidence of cylinder ovoid-shaped cases, lytic boxes or stone slab-covered pit-tombs. Some grave markers shaped after hut roofs and after knobbed helmets have been found in the Selciatello Sopra necropolis in Tarquinia.²²⁰⁵ Where it was possible to compare the elements of these kinds of structures with the grave goods, it was observed that those structures usually coincide with plainer indications of role with respect to the average, such as the spindle whorls in women's graves²²⁰⁶ and the weapons in men's.²²⁰⁷ The rapid achievement of such a structural complexity used in funeral rituals becomes very clear, and with it, we can identify the internal dynamism of a society

testing a rapid development of new models of aggregation.

Fig. 42.1: Male tomb group from the grave Selciatello 75 of Tarquinia (after Iaia 1999, fig. 9 A)

This observation can be further supported by a brief examination of the data on the elements of the burials, which are composed by the urn of ashes and the items included in the grave goods.

The most commonly urn of ashes is certainly the biconical vase, usually with a horizontal handle or two handles, one of which broke during the ritual. This use has been interpreted as a rite of passage and as a sign of consecration²²⁰⁸ to the gods associated with the vase itself and therefore of the deceased's ashes.

Normally the jars are covered by a one-handled bowl, but in some contexts differences regarding the covering of the biconical jar were observed. The urn lid made as a symbolic ceramic helmet was commonly found in several early necropolises (Fig. 42.1). In Grotta Gramiccia necropolis in Veii, e.g., sixty percent of graves containing male markers showed this kind of covering.²²⁰⁹ Here, in some children's burials, we can find helmet lids that indicate the possibility of characterizing men as warriors as early as their childhood, maybe for hereditary rights. These rituals are clear signs of the evolution of new and complex social relationships and structures.

Fig. 42.2: Male tomb group from the grave Impiccato 25 of Tarquinia (after Iaia 1999, fig. 8 A)

Ceramic helmet-shaped lids with a small hut roof on top, used as coverings, have to be interpreted in the same way. The addition of the roof of a hut, a symbol of the family home, enhances the symbolic value of the urn. It combines two roles for men— that of a warrior and that of the father of the family, who holds a sort of right of citizenship within the community.²²¹⁰ A first definite indication of social standing is then added to the role of warrior. A special remark has to be reserved for burials with hut-shaped cinerary urns (Fig. 42.2), which are common in the oldest burials in Latium vetus and quite rare in Etruria, where we can find a few examples of men's graves.²²¹¹ It has been suggested that this kind of urn can be reconnected with a priestly function of the deceased²²¹² or with the high social standing of people with an upper-class status, indicating an early form of political authority. The cinerary urn ultimately becomes the bearer of symbolic meanings and the object of marked identification with the dead, with his attributes of role and status and sometimes with the family home as a primary component of his identity.

Regarding the graves goods, we can observe that most of the early burials do not have any vascular set of items, while during the ritual the deposition of items was almost exclusively of personal goods. These were typically one or more *fibulae*, in many cases placed into the cinerary urn.²²¹³ We can also find spinning tools—more rarely weaving tools—other than ornaments, in women's graves and, from the late ninth century, razors in men's graves. These forms of expression are quite limited; in the initial stages, burials without any grave goods prevailed almost everywhere.

1.2The advanced stages

With the transition to the advanced stage of the Early Iron Age (eighth century) it is possible to more precisely define the ritual models.

As for the relationship between ritual and structure, there was a general

increase in the size and articulation of burial spaces and a growing connection between the grave structure and the symbolic and communicative complexity of the funeral ritual itself.

In southern Etruria, where burials were more widespread, rectangular graves were enriched with one or more lateral *loculi* (Fig. 42.3). The case of Veii²²¹⁴ is emblematic; in this area a steady enlargement of graves along with the use of large wooden coffins can be observed from the first half of the eighth century. Then, we can find graves with their lateral *loculus*, which is usually used for placing pottery goods, or even graves with a double *loculus*, used to house mortal remains and their pottery set.²²¹⁵

A spatial analysis which has recently been carried out on a group of cremation burials in Verucchio²²¹⁶ has led to the recognition of a modular partition of the great pit-tombs inner spaces, which can be assimilated to rooms such as:

- The *main chamber*: the deepest part, dedicated to the cinerary urn;
- The *grave hall*: usually the middle part or the space round the urn, but detached from it;
- The access *dromos*: the highest part of the grave, often overlying a layer of wooden planks.

This division, combined with a distributive analysis of the mortuary equipment, has made it possible to suggest interpretative hypotheses about cremation, referring to the grave structuring. It has also contributed to a better understanding of the reasons for the great abundance and increase in the use of banquet vases and pottery—meaning an increase in eating and drinking on the part of the rising aristocracy during funerary rituals.

Fig. 42.3: Plan of the grave AA1 of the Quattro Fontanili necropolis in Veii (drawing SAR-Laz)

The presence of pottery has been observed in several different areas of the graves, that presented different features and meanings. In the *grave hall* intact banquet pottery²²¹⁷ is often placed with its furnishing. The space therefore seems to define the deceased as a “social person” who had a place in a highly ritualized elite ceremony, and was ultimately transferred to the afterlife. In the *main chamber*—an area reserved for the cinerary urn and the grave goods—

and the *dromos*, the presence of pottery made useless during the rite has been observed. Thus, the intact pottery found in the *main chamber* suggests a perpetual function, a sort of everlasting banquet of the dead, while in the other two spaces, we recognize the material remains from the banquet of the living, celebrated during the funeral ritual,²²¹⁸ to consecrate the deceased's passage to the afterlife.²²¹⁹ These are various constitutive moments of a complex funeral ceremony, which links eschatological features to fixed social rituals.

The deceased were buried in personal graves with individual characteristics reflecting their social status. The anthropomorphism of the urns became a typical mark of cremation burials of the rising elite and can be conceptually connected both to the desire of softening the destructive power of cremation²²²⁰ and the increasing need to restore and enhance individual prerogatives of role and social status. At this stage, where the burial is prevailing, the choice of the crematory ritual is often linked to ideological reasons. In the necropolises at Veii²²²¹ and Pontecagnano,²²²² cremation remains have been found in the graves of prominent warriors who would have had a very high social status. Cremation seems to have been a conceptual choice, intended to dignify with a strongly traditional rite the individuals belonging to the highest level of a fully aristocratic society, which seems at the same time to have been prematurely inspired by the typical heroic Homeric Greek burial.²²²³

Among the best-known cases of cremations from this period are the graves of warriors I and II in Poggio dell'Impiccato necropolis in Tarquinia.²²²⁴ The funeral urns were found lying down—as if to emulate the burial position of a body—covered with a crested helmet in grave I and with a bronzed half sphere shaped like a human face in grave II. Both vases had golden foil fragments on their surface, probably used to decorate a fabric meant to wrap the body. The intention of personalizing the jar of ashes using clothes and goods in grave I and by a funeral mask in grave II²²²⁵ appears now clearly. Evidence of the practice to personalize the ashes container is known in Veii, where women's cinerary urns were found near bronze plaque belts,²²²⁶ and similar items were even found in Vulci,²²²⁷ Pontecagnano,²²²⁸ Sala Consilina,²²²⁹ Bologna²²³⁰ and Verucchio.²²³¹

The emergence of remarkable elite graves can be noticed from the third quarter of the eighth century in conjunction with a diffused medium-high-quality of the grave goods. This proves the establishment of a dominant group and the process of its internal structure.

In the Quattro Fontanili necropolis in Veii, we observe a highly important cremation grave, the AA1 (Fig. 42.3), dated to the mid-eighth century.²²³² The grave goods are composed of a ceramic banquet set and several personal belongings that indicate the deceased's role and social status, including a bronzed cinerary urn covered with a crested helmet, four ceramic vases of established worshipping value (It. *calefattoio*)²²³³, a small round bronze shield, horse bits, a short sword, a spear and a winged axe.

Another example is tomb 39 in the Benacci Caprara necropolis at Bologna.²²³⁴ Dating to the second half of the eighth century, it housed a bronze cinerary vase and a luxurious bronze pottery set, in which we can find a large bronze vessel of high cultural value (It. *presentatoio*). There were also horse bits, a sword, a curvy blade knife—probably associated with cutting meat and so with sacrificial practices—and three winged axes, one of which has symbolically a large curved cutting edge.

Clearly, then, in the final stage of the examined period, funeral practices were closely linked to the self-affirming need of a small aristocratic group of people at the top of the social hierarchy.²²³⁵ The leading figures of this social class represent themselves through attributes that can show their prerogatives. The aristocratic banquet is an essential theme, which is glorified by the opulence and preciousness of the pottery,²²³⁶ and the military bravery is exalted by weapons and the emphasis on the utilization of horses.²²³⁷ Added to this “basic level of funerary language”—common to the emerging classes—is the symbolism of the sacred rituals administration, emphasized by tools connected with sacrifice and worship. The emergence of a symbolic way to indicate political power—represented by the axes—helps complete the picture. It has been observed that in Etruria axes were not only tools for cutting woods or weapons used in war²²³⁸, but they soon gained the role of a sign of power as well as of a sacrificial tool, which is a concrete and tangible power, handed down within the family line.²²³⁹ All these attributes (military, priestly and political) have been made eternal by funeral rites, which acted like a real performance²²⁴⁰. The attributes celebrate and glorify the dead as mythical ancestors, helping to define the upper-class social status of the deceased.²²⁴¹

2Forms of worship

Data related to structural ruins of buildings are extremely limited for the period at hand. We have to take into account different resources that can indirectly enlarge our data on religious practices primarily including objects placed in some elite burials, which emphasize the rights of the grave owner to worship. Moreover, we have to consider some exceptional figurative examples, showing plain religious features.²²⁴²

The most important worship structures are those in Pian della Civita at Tarquinia²²⁴³, an area that practiced religious rituals from the half of the tenth century. A natural pit with ritually placed pottery and offerings of firstlings and cereals has been found there, as well as the remains of a hut that probably housed furnishings for worshiping practices. From the ninth century, a fence was added to the sacred area, in which the body of a supine child was found²²⁴⁴. At the beginning of the eighth century, the sacred fence was rebuilt

using stones and the body of an adult man²²⁴⁵ in the same position was placed near the pit. Food offerings are reminiscent of ancestral female fertility cults, while the two burials, which were certainly consecrated to the gods, suggest the practice of cruel and sacrificial rituals.

Between the Early Iron Age and the Orientalizing period, we can observe significant traces of worshiping in the suburban area of Banditella nearby Vulci, where a spring water yielded finds belonging to the Middle and Late Bronze Age²²⁴⁶. From the Early Iron Age this site became a place of worship, building a large wall in front of the spring, in order to form a triangular basin. Ritual elements are placed along the banks, including miniature pots and several pieces of jewelry. It is quite difficult to interpret the data precisely in regard to the worship features; there were only a few similar worship places in the early stages in Etruria, while sacred springs in Latium vetus have many similarities, even from a structural point of view.²²⁴⁷

Among the worship tools found in funerary contexts, widespread multiple-container vases (Gk. *kernoi*) were widespread. This kind of vases includes “candelabra” shaped pottery, multiple-neck vases and double or triple containers.²²⁴⁸ The interpretation of these elements such as worshiping tools has been confirmed from long now. Their function can be related to the offering or the preparation of beverages and food during ceremonies. Wheeled cult ritual chariots had particular importance, and have been understood as incense burners or supports for containers that held purifying water.²²⁴⁹ The most ancient example of these objects has been found in grave 2 in Olmo Bello necropolis in Bisenzio belonging to the eighth century; they were used until the Orientalizing period²²⁵⁰. Bronze *presentatoi* from the area of Bologna—on foot trays with trapezoidal fins and central basins²²⁵¹—are thought to have been used as ceremonial chariots. This is also true for the *calefattoi*,²²⁵² square-shaped pierced vases with long vertical central necks, which were very popular in the ancient Latium, but also used in the Etruscan area, especially in Veii and Pontecagnano. These objects most likely served the worship of deities—one of which could be the Etruscan version of the Roman goddess *Ops*—connected with the female functions of producing and preserving wealth. This function is symbolized by the offer of food.²²⁵³

Some cups with elevated handles closed by a double circle, and with a central female figurine surrounded by small animal figurines (Fig. 42.4). This kind of cup has to do with female deities worships.²²⁵⁴ This pattern is reminiscent of sacred subjects derived from the Near East; the “naked goddess” model, connected with the female body as a generator,²²⁵⁵ can be linked with the theme of the mistress of the animals (Gk. *potnia theron*) and her relation with nature and fertility. Most of the cups in question come from the graves of women who probably used these same sacred tools as ritual officiates. That seems to be confirmed by the representation of a high status woman in the famous and complex depiction of the Bisenzio chariot, who holds a similar cup in her hand, seemingly during a sacrificial offer.²²⁵⁶

Among the sacred objects, it is worth noting a well-known cinerary lid found in Pontecagnano (Fig. 18.1).²²⁵⁷ At its top, it depicts a scenes of two seated plastic figurines—a man and a woman with monstrous faces and palmed limbs embracing each other—which has been interpreted as a sacred marriage union (It. *ierogamia*)²²⁵⁸ between the deceased and an underworld goddess, who, passing her arm around his shoulders, introduces him to the afterlife, and turns him into a hero. The deceased's monstrous shape indicates his physical shape.²²⁵⁹

Fig. 42.4: Bronze cup with central female figurine from the grave 2 of the Olmo Bello necropolis in Bisenzio Rome, Villa Giulia Museum (photo SAR-Laz)

The plastic decoration on the bronzed cinerary urn in female grave 22 in the Olmo Bello necropolis at Bisenzio proves the savage and monstrous aspect of the gods of the underworld (Fig. 16.1).²²⁶⁰ At the top of the jar lid is a monstrous chained figurine, with webbed limbs and its snout prognathous. Seven spear wielding ithyphallic (with one exception) male figurines perform a ritual dance around the chained figure. On the shoulder of the vase is another ritual dance, in which nine male figurines armed with shields and spears move toward a separate scene in which a man is holding a cow by its tail while facing a great warrior armed with a club and a spear. Both scenes have been interpreted as a sacred dance (Gk. *pirríchia*) around a death god, performed by a group of warriors, probably on their return from war, as it seems to indicate that the figurine of the prisoner could be sacrificed to appease the gods. The cow group has been interpreted as a sacrificial scene of underworld deities. The sacred dance has been linked to the classical Latin tradition of the *Salii* colleges of priests and their warrior nature.²²⁶¹ This practice might be related to the *octobralia*, the ritual dances performed by the *Salii* in October at the time of the return from war. It has been suggested²²⁶² that the warrior and cow scenes can be related to the episode of Geryon's cattle robbery in the Heracles saga.²²⁶³ It could thus be a very early reception of the Greek myth in Etruria, surely made through the first Euboean colonies in Italy, which influenced the iconographic choices of an expanding Etruscan aristocracy.²²⁶⁴

These elements demonstrate the emergence of an original religiosity closely connected with the relationship between man, nature and death. The presence of water worship, and the worship of fertility goddesses and monstrous underworld deities serve as the primary proof of this new kind of cult. An important role in the administration of the liturgies must have been played by women of the emerging-classes, as we can see from the huge presence of worship tools in women's graves and from figurative themes. All this can be added to the adoption in second half of the eighth century of patterns and iconographical frames derived from the Near East and the introduction of Greek mythological features.²²⁶⁵ Finally, forms of worship in Etruria seem to have, at this stage, a very strong relationship with the common ritual practices in Latium vetus. These features give origin to a complex cultural view in which the emerging elite claimed a privileged relationship with the underworld gods and the divine forces governing nature and fertility as a guarantee of social and political stability.

43Economy, 10th cent.-730 BCE

Abstract: In economic terms the clearest features for Etruria during EIA1 (1000/950–800 BCE) are:

- The increasing role of a landlocked network of exchange crossing from northeast to southwest Italy with Etruria at its core. This network was managed by part-time traders who gained advantages over the rest of the population by dominating exchange and communication.
- The growing exploitation of the local metal ores due to a gradual substitution of copper-alloy tools and weapons by those of iron.

For EIA 2 (800–730 BCE) there is evidence for:

- Accelerated population growth.
- Craft specialization on account of politically motivated demands of the emerging upper classes for prestige goods.
- The definite opening of the existing exchange network to overseas merchants/craftsmen from the Levant and Euboea.

Food, shelter and clothing are the three economic necessities of life. In Etruria, everybody seems to have had access to these necessities. Shelter during the whole Early Iron Age consisted of huts that were probably constructed with communal labor by extended families or by clans. Clothing and textiles were produced in most households, mainly as additional—though labor-intensive—tasks for women. For the rest, the production of food or agriculture constituted 90–95% of the labor. The remaining 5–10% was for activities such as mining, metalworking, salt production and a limited amount for trade and political-religious services.

Agricultural land in Etruria was predominantly collective and probably belonged to clans. Some rising families within each clan, possibly those managing long-distance exchange, started to control labor of their fellows and thus claimed part of the productivity. For economic progress, it seems to have been essential that the rising upper class found ways to collect and dispose of surplus production. This probably gave rise to economic inequality in return for social-economic protection.

Keywords: Exchange network, craft specialization, land, agriculture

1Introduction

An economy represents the “hardware” of a society and region. It entails the

distribution and exploitation of resources, the organization of labor, demography, appropriation, customs of local and regional exchange, and the consumption of food and goods that are produced and imported. As such, an economy is interlocked with its social and political order. The collective socio-political structure in Etruria will be referred to when necessary, since it structured its economic development but is not discussed independently. For convenience, the Early Iron Age in Etruria is divided in two phases: EIA1 (1000/950–800) and EIA 2 (800–730). During EIA1, economic development shows a gradual increase in scale that accelerated during EIA 2, a period that is partially characterized by overseas contacts and exchange. These contacts brought with them a social hierarchy in Etruria that became more visible in the form of exceptional female and warrior tombs containing local luxury goods, status symbols and some overseas imports.

This chapter presents a general reconstruction of the economy in Etruria from 1000 to 730, which is a challenging exercise in overall interpretation.²²⁶⁶ An extensive discussion on local differences between coastal and interior or northern and southern Etruria is not feasible here. Society in Etruria changed considerably during these centuries, a transformation that is brought to light by archaeological data that reveals evermore differentiation. Regrettably, our knowledge of EIA 1 is still sketchy. Two economic features for this period stand out nevertheless: the establishment of a sound interregional, overland network of exchange, and the steady replacement of copper-alloy tools and weapons with iron ones.

2Demography

A major event in Etruria during the tenth century is the concentration of the population on larger plateaus at central sites that became the nuclei of the future Etruscan city-states.²²⁶⁷ Many smaller Final Bronze Age sites were deserted in favor of much larger plateaus.²²⁶⁸ This territorial restructuring of Etruria does not seem to have been accompanied by a sharp increase in population. The minor Final Bronze Age sites typically housed communities of around 100 people, though higher populations are estimated for some settlements. The larger plateaus, some of which are between 100 and 200 hectares, housed a dispersed population of a few hundreds during the tenth century. They were probably organized in small groups or clans, which are denoted by surveys that often show concentrations of EIA 1 ceramics on specific plots of these plateaus. The rise of a number of prescribed burial grounds surrounding these settlements from EIA 1 onwards, indicates that the groups within them were distinct.²²⁶⁹ If one were to include the people from the large adjoining territory, the population per main settlement might be raised to a few thousand for EIA 1, many of whom probably had a mobile,

semi-permanent lifestyle.

The archaeological evidence from tombs and surveys dated around 800 suggest that several of the larger primary settlements—especially those in southern Etruria— had reached a population of around 1000.²²⁷⁰ EIA 2 is documented as a period of exceptional growth and by 725, this figure could have doubled, at the most. Including groups living in the territories around these central settlements, it has been suggested that some of the chiefdoms/early city-states accommodated over several thousand permanent residents during EIA 2.²²⁷¹ Consequently, the demography is reconstructed as a gradual increase in population during EIA 1 that accelerated in EIA 2.²²⁷² These higher population numbers contributed significantly to the economic growth of Etruria.

3Agriculture, resources and their exploitation

The economy of Etruria depended largely on agriculture.²²⁷³ Its soils are generally fertile, and labor was organized around transhumance and a seasonal farming calendar. Animal husbandry of cattle, pigs and sheep, along with the cultivation of plants such as barley, spelt, emmer and bread wheat, was the basis of the agricultural economy. The occasional remains of wild species and fish in tombs and settlements indicate that meals were augmented with such foods. Other uncultivated foodstuffs such as nuts and fruits supplemented the diet.²²⁷⁴ The archaeological evidence for Mediterranean poly-culture (the cultivation of olives, vines and cereals) is limited, but it might have existed on a small scale nonetheless. Wine grapes were cultivated locally.²²⁷⁵ By the Late Bronze Age, olive cultivation was well established in Southern Italy,²²⁷⁶ and olive trees might have been tended in Etruria as well.²²⁷⁷

A main economic asset of Etruria is its quantity and variety in ore deposits.²²⁷⁸ The main ore deposits are more towards the Tyrrhenian Sea than in the interior, which would have affected the economy of important inland sites such as Orvieto, Chiusi, Cortona and Arretium. Exploitation of ore deposits in Etruria started long before EIA1.

The deposits in Etruria predominantly contain copper and iron ores, and mining grew significantly during EIA 1 due to the increasing use of iron. Andrea Zifferero and Claudio Giardino associate specific ore deposits with settlement patterns while incorporating archaeo-metallurgical evidence.²²⁷⁹ A site like Acquarossa is clearly linked to the mineral deposits in its vicinity. Metal waste products, such as slag, crucibles, semi-manufactured iron and copper have been reported in some huts, which date from the eighth century onwards.²²⁸⁰ The findings imply that mining might have been a communal activity.²²⁸¹ The exploitation of tin and silver ores in Etruria remains contested.²²⁸² Gold had to be imported into Etruria, and an evident increase in

its deposition in tombs from the late ninth century until around 650 suggests widening markets and the ascent of Etruria's interregional, overseas economy.

4Territorial control over resources

The concentration of the population on the larger plateaus was accompanied by surrounding territories ranging on average between 1,000 and 2,000 sq km, although borders were still poorly defined.²²⁸³ Natural features like rivers and streams functioned as boundaries. Territorial control over resources appears to have been weak, although it increased during the late ninth and eighth century due to the rise of secondary settlements.

The extraction of the local iron ores emerged at least from 950–900 onwards, when iron gradually replaced copper-alloys as the main metal for tools, weapons and construction. Gregory Warden presents a hypothesis for the intensification of the mining activities. He suggests that mining was characterized by incipient—possibly seasonal—exploitation prior to 800, while specialized mineral production increased from 800 to 550.²²⁸⁴

In essence, this hypothesis can be considered valid, particularly for the most important mining regions in Etruria. Nevertheless, there are indications that the economic importance of mining centers fluctuated. Such centers could boom during periods of economic prosperity, and fade due to a lack of socio-political significance. The general increase in metal production is also reflected in a model presented by Anna Maria Bietti Sestieri, who points out that there was a continuing rise in production with a diversification of the repertoire and appearance of local typologies during the tenth and ninth centuries, indicating resident bronze industries.²²⁸⁵ Mining and working of the ores was probably a communal, part-time pursuit. There is no evidence for the hypothesis that mining was *corvée* labor by the ruled for the rulers.²²⁸⁶

Comparable economic circumstances are implied when examining data for the exploitation of coastal areas and salt pans. The district, taken as an illustration, is called Le Saline on the coast, at a distance of about 9 km from Tarquinia. Some archaeological contexts contain exclusively large vessels of red-brown impasto.²²⁸⁷ Like at other salt pans, tableware is almost absent. Similar EIA 1 and 2 sites are found nearby, which are part of a series of minor sites with specific functions for the use of lagoon environments while producing salt and raising fish. Alessandro Mandolesi interprets these coastal sites as being related to the emergence of a complex settlement system during EIA 1 with Tarquinia at its center.²²⁸⁸

5Exchange network and the role of Etruria

The exchange network with Etruria as hub is documented in the circulation of specific types of artifacts and the comparable funerary practices. This creates countless distribution maps, for example, of Sardinian finds in Etruria, of crested helmets or of particular Levantine bowls (Figs. 44.1 and 44.4).²²⁸⁹ These distribution maps imply that Etruria had become one of the core-regions in the Mediterranean and beyond from the ninth-eighth centuries onwards. The starting point for this role of Etruria as economic hub lies in a string of important settlements from Calabria to the Veneto.²²⁹⁰ It included sites on the Adriatic such as Fermo and Verucchio and settlements in Campania such as Capua and Pontecagnano. These centers, emerging during EIA 1, appear to have had an open economy with freedom of trade and few restrictions in transfer, relocation and communication. The overland network linking Etruria and the rest of Italy with central Europe is well known, although it is not usually recognized as a main economic asset, which it was; it emerged during EIA1 and remained of importance for centuries. One of the imported commodities being exchanged along this trading highway was amber that originated in the Baltic.²²⁹¹ The overland route for amber started during the Late Bronze Age and continued during EIA 1 and 2. However, the rise of the Villanovan centers from northeast to southwest Italy during EIA 1 extended the internal exchange network considerably into Campania and Calabria. This network eventually also accommodated various groups from overseas, such as Sardinians, people from the Balkans, Phoenicians and Euboeans, who arrived in Italy mainly from EIA 2 onwards.²²⁹²

Iron, a new and valued material when it became adopted during EIA 1, shows an opposite distribution pattern when compared to Baltic amber since it is found in substantial quantities in southwest Italy from the tenth century onwards and became common in other parts of Italy during the ninth century. Iron was available in Italy more than a century prior to its adoption in Europe north of the Alps. The spread of iron technology is thought to have been an overland, internal development after being triggered by contacts with Phoenicians during the 10th century BC in southern Italy as it was in Spain/Portugal.²²⁹³ The increasing use of iron in various parts of Italy would have assisted the expansion of the domestic exchange routes during the ninth and eighth centuries, as did the increasing consumption of Baltic amber.

6Practice of exchange

The practices surrounding exchange do not seem to vary much during EIA 1 and EIA 2, since clear evidence for market principles and units of weights or volume is hard to detect. Exchanges between unrelated individuals were mostly by barter or negotiation. Specific quantities of metals or salt may have functioned as early forms of currency from the Late Bronze Age onwards,

which as a standard unit of exchange would certainly have simplified the bartering process between different groups, but this remains hypothetical. Practices of exchange depart from the process of commoditization. Keith Hart has described this process as a sequence of characteristic “*stages in the progressive abstraction of social labour*.”²²⁹⁴ Production for personal use does not involve exchange but often remains an option for an individual in any society. Much of the food and many everyday goods were produced in agrarian households and were not intended for exchange at all. It remains uncertain when quantification and a market mechanism were introduced in Etruria.²²⁹⁵ There are indications that exchange by quantification developed in Italy during the Middle and Late Bronze Age, especially for interregional trade.²²⁹⁶ Archaeological evidence demonstrates that quantification with overseas traders functioned in central Italy from the eighth century onwards. Exchange by quantification might have been used during EIA1 and 2 for interregional commerce, especially in metals, while reciprocity within a clan setting was probably the preferred mode of exchange for local barter outside the family unit. During EIA 1 and 2 some commodities were the product of divided labor and the increase in craft specialization, which led to the workshop mode of production from the ninth century onwards, will have assisted the development of exchange by quantification.

7Primary evidence of production: data on the manufacture of ceramics, metal and other commodities

The primary evidence of the production of goods is comprised of the material remains of the *chaîne opératoire*, such as loom-weights, spindle-whorls, kilns, actual workshops, ovens, furnaces, ceramic wasters, metallurgical debris and other evidence directly related to production. Thus metallurgical debris from the Late Bronze Age-Early Iron Age sites, such as Gran Carro, Scarceta, Elceto, Sorgenti della Nova and Luni sul Mignone, indicates that metalworking was a part-time activity of resident smiths. During the ninth and eighth centuries, the production at local metal workshops was transformed significantly.²²⁹⁷ For example, there was an increase in the production of fibulae, which began to be produced in series, and thus became normal, customary goods. The major change in metalworking, however, was the general shift from copper-alloy to iron tools and weapons. In many areas, iron knife blades are the earliest sign of iron's acceptance for functional use,²²⁹⁸ which is certainly valid for central Italy during the ninth century. Iron became thoroughly employed during the eighth century. The almost complete replacement of copper alloy tools and weapons by iron ones in about 200 to 250 years in Etruria and elsewhere in Italy signifies a major economic event.

During this period, the re-smelting of scrap iron could not fulfill the increased demand because there was not enough stock. Therefore the smelting of iron ores had to be intensified. This smelting process was labor and energy intensive. Thus the transition from copper alloy to iron tools and weapons stimulated the economic evolution of the mining regions and had its effects on the rest of Etruria since it led to increasing craft specialization.²²⁹⁹

Gran Carro, a lake settlement located along the borders of Lake Bolsena approximately 40 km northeast of Vulci, provides a useful overview of the standing of metallurgy prior to EIA 2.²³⁰⁰ A small but notable number of metal artifacts, casting debris, ingots and semi-manufactured products, has been found at the site. Among these are strands of tin in a workshop and a two-piece stone mold for making small objects. The data establish the existence of a local foundry and a smithy that had access to quite a number of metals that probably derived from smelting nearby ores.²³⁰¹ The evidence from Gran Carro and from other early metalworking sites in Etruria suggests that the local mineral resources were exploited prior to EIA 2, but not on a large scale.

Populonia is another site with much evidence of metalworking from EIA 1 onwards.²³⁰² The site is positioned between various rich mineral deposits.²³⁰³ Therefore it had access to a range of metal ores. The settlement has long been accepted as one of the most important early iron production centers in antiquity, but it is worth noting that other metals were processed as well. The area immediately around Populonia is characterized by metal processing in general and not just by iron working. Bartoloni wrote that Populonia had an open economy during EIA 2 as documented by imports from Sardinia and Phoenicia.²³⁰⁴ Already in the late ninth century, the chamber tomb had been adopted as a new architectural feature, earlier than in other Etruscan centers.²³⁰⁵ According to Nicholas Hartmann, the lack of early iron and Greek imports in the area around Populonia indicates that Greeks were only interested in the ores.²³⁰⁶ This deduction is primarily based on the assumption that Pithekoussai directed the iron industry in Italy during EIA 2. This is not substantiated since iron was produced and exchanged in Italy from around 950 onwards, about 150 years before the arrival of Euboeans on the peninsula. The scarcity of Greek imports could also imply that Greek traders were hardly present in this specific region during the eighth century.²³⁰⁷

Tarquinius as a main Etruscan center is briefly mentioned because its metallurgical output indicates that full-time smiths worked at the site from EIA 2 onwards. Besides producing customary copper-alloy and iron tools, weapons and ornaments, these smiths were involved in the manufacture of elite items (bronze crested helmets, bowls, cups, various types of vessels, *incensieri* etc.) that are often associated with elaborate warrior tombs.²³⁰⁸

Much of the primary evidence on crafts and industry during EIA 1 and 2 relates to mining and metalworking. Specialization in ceramic production existed but is limited for EIA 1 and 2.²³⁰⁹

8 Organization of labor

Labor was predominantly organized according to agricultural requirements. Most of the commodities used for daily life were made in individual households during slow periods of the seasonal farm labor. For example, Margarita Gleba lists contexts in which textiles were produced and indicates that quite some households were involved in textile production.²³¹⁰ The same might be valid for furniture, basketry, most of the ceramics and some ornaments in bone and horn.

A growth in labor division is recorded for EIA 2. The archaeological evidence demonstrates that economic centralization occurred around resources, natural harbors and elite homesteads.²³¹¹ An increase in local production and consumption of goods is best documented in the extensive Villanovan burial grounds of the ninth and eighth centuries, which are foremost a reflection of the increasing inequality that accompanied the stratification process. The remarkable demand, as recorded in the Late Villanovan tombs, led to a progress in craft specialization, which can be studied as a process. Elizabeth Brumfiel and Timothy Earle described this process of craft specialization as a complex concept that involves a number of variables, like full- or part-time specialization, and individual or household specialization.²³¹² These variables have often led to simple assumptions or wearisome discussions and either/or answers, while it is more effective to look at these sets of variables as parts of a larger whole when interpreting the archaeological evidence available for production and craft specialization. Blending of tasks remained common. Full-time specialization is a rare phenomenon prior to the establishment of several workshops per craft in towns.

9 Customary and luxury goods

Specialization in everyday, customary goods mainly occurred during EIA 1 and 2 for copper-alloy and iron ornaments, tools, and weapons in the local smithies. The manufacture of large ceramic storage jars probably required specific skills and kilns. Their manufacture demonstrates increasing craft specialization though most of the ceramics were still produced in households as a part-time activity.

Luxury goods made by expert craftsmen, such as metal tableware, become more visible from EIA 2 onwards.²³¹³ One could equally point to chariots.²³¹⁴ Many of the prestige goods in Etruria followed prototypes from the Eastern Mediterranean, foremost from the Levant (Fig. 34.2).²³¹⁵ The local demand for such goods encouraged socio-economic complexity in Etruria. To quote Bruce Trigger: *“What stimulated increased economic interdependence and*

*political integration in early civilizations seems to have been the trade and craft specialization by the politically motivated demands of the upper classes for prestige goods and by expanding markets for better quality mass-produced commodities as population densities increased.”*²³¹⁶ Craft specialization in relation to luxury items is a different process when compared to specialization for “commoners.”²³¹⁷ During EIA2 the workshop mode of production is primarily visible in the manufacture of prestige goods.

10Appropriation of wealth

Appropriation of wealth increased within a context of clan relations. This appropriation was most likely based on rising control over the output of labor.²³¹⁸ It took centuries before land could be privately owned—that is, freely bought and sold; even in Roman times public land still existed.

A noticeable change in the appropriation of wealth is reflected in the transformation in hoarding shifting between communal and private interests. The first radical change is the disappearance of hoards, which merely contain copper-alloy artifacts, during the eighth century.²³¹⁹ The hoarding of copper-alloy artifacts declined with the upsurge of iron. The change is probably also associated with other regimes of hoarding. During EIA 2, one can observe two different customs of accumulating metals, this time in combination with other goods. Metal deposits and hoarding were either related to individual enhancement as marked by the high-status tombs, or, slightly later, to a communal ideology as embodied by the votive deposits at some of the sites where main sanctuaries emerged. From the late ninth century onwards, appropriation of wealth is primarily reconstructed as a result of growing control by a few over the various products of labor by the many.

11Conclusion and discussion

In economic terms the clearest features for Etruria during EIA 1 are:

- The increasing role of a landlocked network of exchange crossing from northeast to southwest Italy, with Etruria at its core. This network was managed by part-time traders who gained advantages over the rest of the population by dominating exchange and communication.
- The growing exploitation of the local metal ores due to a gradual substitution of copper-alloy tools and weapons by those of iron.

For EIA 2 there is evidence for:

- Accelerated population growth.
- Craft specialization on account of *politically motivated demands of the upper*

classes for prestige goods.

–The definite opening of the existing exchange network to overseas merchants/ craftsmen from the Levant and Euboea.

Agricultural land was predominantly collective and probably belonged to clans. Some rising families within each clan, possibly those managing long-distance exchange, started to control the labor of their fellows. For economic progress, it seems to have been important that the emerging upper class found ways to collect and dispose of surplus production. This gave rise to economic inequality probably in return for socio-economic protection. So far, the elite in Etruria are best recognized in an ever more conspicuous funerary ritual, especially from around 800 to 650. For this to happen, the upper class in Etruria had to appropriate a share of surplus production of the local resources. Patron-client relations became established and made socially arranged appropriation feasible.

The economic correlation between supply and demand is essentially regulated by the size of the population and the coverage of markets. As long as demand favors production and *vice versa*, it will sustain increasing social-economic complexity.

44External Relationships, 10th cent.-730 BCE

Abstract: This chapter focuses on the main phenomena of long-distance exchange relationships in Early Iron Age Etruria. The emergence of new demographic hubs and centers of power resulted in the general growth in the circulation of raw materials and artifacts. This was accompanied by the selective transmission of foreign models of material culture, styles, technologies and knowledge. They can be differentiated according to diachronic development, direction of influences and vectors.

In the initial stages of the Iron Age the connections were mainly oriented towards central and northern Europe on the one hand, and the great Tyrrhenian island of Sardinia on the other. Most relationships were centered on the metal trade, but possibly a considerable role may have been played by other raw materials, such as amber. Connections with continental Europe were associated with the wide diffusion of bronze artifact typologies, such as antenna swords, elements of armor and ceremonial vessels, presumably transmitted by foreign smiths in the service of local elites. Relations with the Nuragic civilization, monopolized by maritime north-central Etruria, were of a different nature, involving imports of small bronze objects and a specific kind of ritual pottery vessel, the askoid jug, which was also locally imitated by Sardinian immigrants.

In the late ninth and eighth centuries, in association with the reactivation of Mediterranean colonial movements and trade, central Tyrrhenian Italy started a new cycle of contacts, mainly with people of the Near East (Levantine, Phoenician) and Greeks.

Oriental goods, especially luxury items, such as ornaments and bronze cups, but also painted ceramics of Greek manufacture, were increasingly traded. Acceleration of relationships occurred around the mid eighth century, when the foundation of trading posts and colonies by Euboeans and Phoenicians (such as Pithekoussai and Sulcis) fostered the immigration of oriental craftsmen and the transmission of exotic material culture patterns, linked to the areas of commensal practices and power imagery.

Keywords: Levant, Central Europe, elites, trade, exchange

Introduction

The great territorial and sociopolitical transformation around 930–900 BCE in the Etruscan area (see [chapter 33](#) Pacciarelli) prompted a process of increasing openness to long-distance exchange, as well as productive and economic centralization. “Exchange” in this case is intended as a very general label encompassing a wide range of situations: not only movements of raw materials or finished items, but also transmission of more intangible things, such as formal models, styles, and technological traits, as well as rituals and cosmological/religious beliefs.[2320](#)

According to an established view,²³²¹ beginning in the latest part of the Bronze Age (*Bronzo Finale*, twelfth-tenth centuries), Etruria proper gained a central role in the long-distance metal trade linking the eastern and central Mediterranean to northern Alpine Europe, a phenomenon that gave birth to intensified connections with continental areas. These external links were mediated by important sociopolitical entities in northern Italy, for example, Frattesina in the Veneto, whose precise relationships with Etruria are currently under debate. In the subsequent Early Iron Age, the picture appears more intelligible, due to a greater amount of archaeological data. The nascent proto-urban sites by nature began to attract large quantities of raw materials, commodities, and people from abroad, and this tended to create patterns of local material culture that were much more heterogeneous than in the past. For these reasons, the topic of Etruria's external relationships in the Early Iron Age is very broad and intricate.

An oversimplified but useful sequence can be outlined, in which three different waves of relations occur, each with specific characteristics and a definite chronological position. At the initial stage and at the start of the advanced phase of the Early Iron Age (late tenth-ninth centuries), particularly intense relationships with Sardinia and with central Europe are observable, while in the course of the late phases (mainly the eighth century), Mediterranean-based contacts were assuming a growing importance. In these three waves, different means, and therefore divergent paths, whether maritime or terrestrial, were employed, and this might have had specific implications for the vectors and significance of contacts.

1 Relationships with continental Europe (ca. 930–770)

At the beginning of the Early Iron Age, remarkable interactions between continental Europe and central Italy are visible mainly in the field of bronze metallurgy.²³²² An internal chain of connections and routes that exploited the main river courses northward and southward facilitated the circulation of material culture. North of the Apennine mountains a key mediator role was played by emerging central places, such as Este in the Veneto, Vadena in the lower valley of the Adige River (not far from areas rich in copper ores), and above all by the huge center of Bologna in the Po plain.²³²³ The latter, though already established as a demographic hub in the ninth century, in the eighth was reaching quasi-urban status.²³²⁴ Moreover, from the late ninth and early eighth centuries onward, the direction of influence was reversed and north-central Italy became a starting point for new dissemination of artifact models, especially across the metallurgical districts of Early Hallstatt Europe.²³²⁵

We should distinguish two different kinds, or patterns, of relations: a

“diffuse” one, and a “directional” one. “Diffuse” exchange involves other areas of Italy and concerns the sharing, by a large part of the Peninsula, of specific forms and stylistic features of bronzecraft, mainly attached to the prestige sphere, which are further attested north of the Alps. A significant example of “diffuse” relations is the Europe-wide distribution of the remarkable family of swords with solid-cast hilt, especially *antenna* swords. Of these, particularly important in Etruria is the Tarquinia type, which links all of central and northern Italy to central and northern Europe²³²⁶ (Fig. 44.1). Closely akin to the Tarquinia type, but geographically centered on the entire middle and northern Adriatic area, are the Fermo and Rocca di Morro types. Probably the oldest example of an antenna sword in Etruscan territories comes from an outstanding warrior burial discovered in the necropolis of Arcatelle at Tarquinii (second half of the ninth century in traditional chronology), which suggests that the use and funerary deposition of this kind of weapon is linked to an emerging top level of social standing²³²⁷ (Fig. 41.2).

Another significant type of antenna sword is the one called Weltenburg-Corcelettes.²³²⁸ It is documented by a few pieces at Bologna and in northern Italy,²³²⁹ and testifies to strong connections between the northwestern Alps and the northern Villanovan groups, possibly controlled by Bologna.

Even though *antenna* swords represent uncommon—albeit culturally significant—finds in Villanovan burials, in the absence of archaeometric investigations it is difficult to determine which were imports and which were local products made by artisans with a Central European metallurgical culture.

“Directional” contacts with Europe north of the Alps are best represented by style and formal characteristics of the sheet bronze production which flourished in Villanovan Etruria, earlier in the southernmost area and later north of the Apennines.²³³⁰ The sheet bronze industry has been a recurrent subject for scholars interested in highlighting long-distance connections of Italy with northern and Central Europe in the Urn-field period.²³³¹ The topic of bronze helmets illustrates the initial stages of this phenomenon. In Etruria proper, the earliest examples of bronze helmets, found at Tarquinii and Populonia, date to early and advanced Phase 1.²³³² They have some similarities with the helmet class known as *Glockenhelme*, or *glockenförmige Helme mit gegossenem Scheitelknauf* (“Bell-shaped helmets with cast knobs”), whose major concentration is in the Carpathian Basin and the middle Danube area²³³³ (Fig. 44.1). These similarities lie in their general shape, and more particularly some technical characteristics: for instance, the application of *Überfangguss*, a sophisticated technique, well known in Late Bronze Age central and northern Europe, of attaching a bronze socketed knob to the helmet, casting it directly on the sheet with the aid of a removable mold.

Fig. 44.1: Distribution of prestige bronze items connecting Etruria with continental Europe (10th to 8th cent. BCE)

The initial manufacture of sheet bronze vessels was even more dependent, if possible, on trans-Alpine models, techniques and stylistic patterns.²³³⁴ Most bronze cups found in Early Villanovan burials (local phases 1–2A) belong to the Stillfried-Hostomice model, a peculiar form whose finds are especially concentrated in ninth-century contexts around the middle Danube and Elbe river valleys²³³⁵ (Fig. 44.1). Manufacture of these items in Italy was geographically restricted to just a few sites: it seems to have been a monopoly of Tarquinii and Bologna, even though a few specimens have been found outside these centers, probably as imports.²³³⁶ Another important outcome of

the same bronzecraft in Etruria that reveals close trans-Alpine connections is the “necked amphora.” It belongs to a Late Urnfield and Early Hallstatt class mainly attested in the form of cinerary urns in outstanding burials or as sacred offerings in hoards, with particular concentration in northern Europe²³³⁷ (Fig. 44.1).

The most significant bronze necked amphora from southern Etruria, found in the “princely” tomb AA1 of Veii (Fig. 44.2a),²³³⁸ finds its best comparison in northwestern Germany, at Gevelinghausen²³³⁹ (Fig. 44.2b), and secondarily in specimens from northern Europe (northern Germany, Scandinavia, Poland), such as Herzberg, Przęsławice, and Seddin.²³⁴⁰ Both vessels from Veii and Gevelinghausen were decorated by embossing and stamping with a specific version of the Sun-Bird ship or *Vogel-Sonnen-Barke* motif, further linking these artifacts to a wide central/northern-European network of the Urnfield and Early Hallstatt age.²³⁴¹ Though roots of this ornamentation are well grounded in the Late Bronze Age, only from the Early Villanovan period did it gain favor in Etruria as the most specific decorative style applied to prestige bronze items,²³⁴² particularly those symbolically connected to manifestations of the utmost power, such as helmets, shields, belts, and ceremonial vessels.²³⁴³

Fig. 44.2: Bronze necked amphorae of the Veii-Seddin-Gevelinghausen type. a: Veii (Rome), tomb AA1 (after NS 1970); b: Gevelinghausen (Meschede, Germany) (after Jacob 1995)

The relations illustrated above could possibly be explained by the existence of a vast network of links among regional elites, but questions arise about the precise agents of these exchanges. A possibility is that some particularly skilled metal smiths had a major role in facilitating such a relationship, for example by transmitting their particular skills to distant communities that

“spoke” a similar stylistic language. Dealing with this Villanovan-northern European connection, K. Kristiansen argued for a possible relation with the amber trade, which around 850–800 began to assume again great importance in a wider European context.²³⁴⁴ Reciprocal formal connections in northern Europe and Italy, specifically illustrated by Stillfried-Hostomice cups, Veii-Gevelinghausen-Seddin vessels, and antenna swords, seem to speak in favor of this idea. This phenomenon could have been the forerunner of north-south trade movements becoming more substantial by the second half of the eighth century. In that period Italian imports north of the Alps were steadily growing,²³⁴⁵ apparently in relation to the flourishing of Verucchio and Vetulonia as the foci of the amber trade in Europe.²³⁴⁶

2 Relationships with Sardinia (ca 930–770 and beyond)

A contemporary connection, but totally different in nature, links Villanovan Etruria to the Nuragic civilization of Sardinia, the great island of the central Mediterranean. It is mainly represented by the numerous and typologically variable imports of bronze and ceramic items in burial contexts, which are hugely concentrated in coastal north-central Etruria (Populonia, Vetulonia, and minor sites), but with substantial occurrences in southern Etruria (Vulci, Tarquinii, Caere) and Campania (Pontecagnano)²³⁴⁷ as well (Fig. 44.3). Artifacts found so far consist chiefly of small bronzes, such as anthropomorphic figurines, pendants, buttons, daggers, and *faretrine votive* (votive quivers), and exemplars of a specific ceramic shape, the askoid jug. Remarkable evidence, albeit only based on stylistic analyses, suggest a possible manufacture in the peninsula of Nuragic-type bronzes, such as buttons and *faretrine*.²³⁴⁸ Larger items, such as the exceptional bronze votive boats, whose deposition in Tyrrhenian contexts is a slightly later phenomenon,²³⁴⁹ are an equally significant—albeit rare—occurrence. On the opposite side of the Tyrrhenian sea, in Sardinia, the presence of Early Iron Age imports from the Peninsula (especially fibulae, a kind of ornament not typical of native attire) is attested as well, though on a more limited scale.²³⁵⁰

In Nuragic Sardinia, a flourishing and sophisticated bronze industry, associated with the emergence of monumental cult places, saw its starting point during the latest part of the Bronze Age (twelfth-mid tenth centuries), when it was exposed to profound and enduring influence from the Cypriot and Iberian metallurgical traditions.²³⁵¹ A recent chronological investigation of Nuragic metal hoards and votive depositions²³⁵² has led to the conclusion that this exceptional bronze workmanship reached an acme during the Early Iron Age, especially in its earliest stages (late tenth-ninth centuries). At that time Sardinian bronzecraft, though evidently separate from the metallurgical

tradition of the Peninsula, seems to have been influenced by Villanovan Etruria in some specific fields, as visible in the precise typological characteristics of bronze spearheads and the related butt-spikes (*saurōtēr*).

Fig. 44.3: Distribution of the main items of Nuragic manufacture or imitation in Italy, all of bronze except the first: pottery askoid jugs, votive boats, buttons, miniature containers, flask pendants, votive quivers, anthropomorphic figurines (after Falconi Amorelli 1966; Bartoloni 1997; Delpino 2002; Lo Schiavo 2002; Lo Schiavo 2008)

In this perspective, the presence of several Nuragic objects in Villanovan contexts could assume a definite meaning. In particular it suggests a maritime connection which, in the framework of a complex trade system, linked proto-urban centers committed to exploiting metal rich areas (the Colline Metallifere and the island of Elba), such as Vetulonia and Populonia, to a multitude of Nuragic communities. The latter beginning in the Late Bronze Age were intensely engaged in seafaring activities, as is increasingly recognized in recent studies.²³⁵³ The maximum intensity of this phenomenon can now be fixed, especially given the abovementioned study²³⁵⁴ and burial contexts in the Etruscan area, to the mid ninth and early eighth centuries, but with more limited continuation through the eighth century.²³⁵⁵

This Tyrrhenian connection was probably not limited to the metal trade but was profoundly significant throughout the local societies and cultures, as suggested by the presence in most Villanovan centers, but with striking concentration in the burials at Vetulonia, of askoid jugs, a typically Nuragic ceramic shape²³⁵⁶ (distribution map in [Figure 44.3](#)). Chemical analyses of the composition of the clay of examples from Vetulonia show that a high percentage of them were locally manufactured, while a few (possibly the oldest ones) were imported from Sardinia.²³⁵⁷ The most reasonable hypothesis is to see the exemplars found at Vetulonia as objects transported or reproduced by immigrants who, according to G. Camporeale, might have played a role in metallurgy.²³⁵⁸ The evidence as a whole suggests that the inclination for this ceramic shape in Villanovan Etruria was mainly due to its use in connection to alcoholic beverages, probably wine, in the framework of rites of commensality and cult activity.²³⁵⁹ Individual mobility and direct personal relationships, as in the form of marriage and gift exchange, have been suggested even in regard to the inclusion of prestige items of Nuragic manufacture (mostly small bronzes) in Villanovan elite burials, mainly female, such as the famous ‘Tomba dei Bronzetti Sardi’ at Vulci²³⁶⁰ ([Fig. 44.4](#)), or in comparable contexts at Pontecagnano.²³⁶¹

Fig. 44.4: Small bronze objects (statuette and miniature furniture) of Nuragic manufacture from Vulci, 'Tomba dei Bronzetti Sardi' (after Falconi Amorelli 1966)

There may have been many reasons for this “partnership.” Despite huge differences in social systems and cultures, early Etruscans and Nuragic Sardinians shared probably similar aptitudes at least for maritime activities, as indicated for example by the symbolic focus on boats in the ritual and cult sphere.²³⁶² This could have led to a strategy of pursuing common interests in the control of Tyrrhenian sea routes, but also to exchanges of valuable raw materials (metal, amber, salt, etc.), transfers of knowledge (metallurgical technology), and political alliances.

3 Relationships with the eastern Mediterranean (ca 830–730)

At the start of the Late Villanovan period (Early Iron Age Phase 2), Etruria saw an acceleration of processes toward settlement nucleation and sociopolitical centralization.²³⁶³ Radical transformations affected most aspects of local proto-urban communities, involving the development throughout the entire “Villanovan koine” of much more diversified economies and the emergence of new wealthy social groups, conventionally called “aristocracies.”²³⁶⁴ The growth in circulation of goods, especially luxury

items, as well as of formal models, rituals, and ideological attitudes along the Tyrrhenian shores are elements of a very complex Mediterranean-wide picture that can be fully understood only by taking into account a vast array of sources of information, both archaeological and written.²³⁶⁵ This picture is dominated by the appearance of new historical agents of Oriental origin, Phoenician and Levantine peoples and Greeks, who engaged in the reactivation of maritime trade routes, which have already been exploited by local peoples since the Late Bronze Age.

Scholars have long debated the issue of primacy, and the scale of impact on local cultures, of Phoenicians versus Greeks in the flourishing trade activities during the period 900–770. This is the stage controversially called “pre-colonization.” At the moment, there is agreement that the Near Eastern presence in the central Mediterranean, especially involving Cypriot, Levantine, and Phoenician maritime activities, was slightly earlier than the Greek presence.²³⁶⁶ Moreover, even for the later phases of the East-West connection, given the heterogeneity and archaeologically mixed character of Iron Age Mediterranean trading sites, some scholars have admitted growing difficulties in precisely discerning the ethnic identity of the “merchant agents”²³⁶⁷ who were involved in trade activities. In the framework of this trade, which may have been centered on metal procurement along the Tyrrhenian coasts, some rare specimens of luxury imports of generic Near Eastern production (Levantine, Cypriot, north Syrian) were reaching the shores of peninsular Italy, but only sporadically and irregularly.²³⁶⁸ Specifically these are bronze basins and cups, not attributable to definite workshops. A similar intermittent pattern characterizes the first Greek imports found in southern Villanovan contexts, pottery drinking vessels classified as “pendent semicircle” *skyphoi*, and Middle Geometric II chevrons *skyphoi*, with comparable specimens in Campania, Sardinia, and Sicily, though at this moment it is impossible to specify the vectors of their transmission.²³⁶⁹

A more definite aspect of trade with the eastern Mediterranean started in coincidence with the founding of new Greek and Phoenician trading posts, variably called “colonies” or “emporion,” around 770–750, that is, in southern Etruscan terms, in the local Early Iron Age Phase 2b. The largest of these centers appear to be Pithekoussai on the island of Ischia, which was founded by the Euboeans,²³⁷⁰ and the Phoenician colonial foundation of Sulcis in southwestern Sardinia.²³⁷¹ Both are particularly representative of the intermixing between Greeks and Levantine people which seems to characterize this period, and could have been responsible for the transmission of several cultural traits of Mediterranean origin (especially technical skills) to mainland Italy, notably Etruria.

From this period on, the south of central Tyrrhenian Italy became the focus of a deep cultural transformation, involving the growing appropriation and reinterpretation of numerous Oriental elements into the local material culture, mainly aimed at the nascent ruling elites’ needs for ostentation. Beginning in

the first half of the eighth century, in the wealthy female (sometimes also male) burials of affluent centers such as Veii, Pontecagnano, Cumae and Capua, a great array of small ornaments of eastern manufacture or locally imitated were deposited, including *faïence* scarabs, seals, figural pendants, and beads.²³⁷² At the same time, grave-sets attributable to top members of the late Villanovan communities comprised metal ceremonial objects which, although often manufactured according to well-established local craft traditions,²³⁷³ were employed in rituals influenced by the Oriental power imagery.²³⁷⁴ These include circular shields and chariots in military symbolism, as well as fans, spits, firedogs, bronze flasks, cauldrons, hemispherical basins, and tripods in the framework of commensal practices.²³⁷⁵ Around 750, the ceremonial equipment of the Etruscan elite was enriched by the appearance of a new vessel form directly adopted from Near Eastern banqueting customs—the bronze ribbed bowl (It. *patere baccellate*),²³⁷⁶ which was specifically linked to the consumption of wine, and also marked the introduction of new technological skills, possibly through the immigration of craftsmen.

Greek pottery craftsmen, possibly coming from Pithekoussai, were also responsible for the introduction to central Tyrrhenian Italy of a new class of wheel-made painted tableware, following stylistic patterns of Euboean origin, which included ceramic vessels such as cups and jugs.²³⁷⁷ It was especially in Campania and southern Etruria that this kind of tableware was highly prized, for example at Veii and Pontecagnano, where it is found in several burials, sometimes without any elite connotation, as part of drinking sets for wine consumption.

This opening to pan-Mediterranean connectivity that characterizes the eighth century in Etruria was not a one-way process. Evidence of circulation of Late Villanovan-Early Orientalizing metal products from Etruria appears in the East, although in the specific aspect of votive offerings found in Hellenic sanctuaries such as Delphi, Olympia, Dodona, and Samos.²³⁷⁸ Interpreting this evidence is not an easy task. Many hypotheses have been put forward, even considering the wider framework of the presence of objects from the European “barbarian” world in Greek sanctuaries. A great number of Early Iron Age bronze spearheads, many of which are possibly from southern Italy, can be interpreted as spoils of war offered by Greek colonists after victories over Italics, but this view hardly applies to elements of Villanovan manufacture such as swords, sheet bronze helmets, and shields. These are elements of weaponry employed as symbols of power by leaders of the local communities, a fact that renders likely their direct dedication by illustrious members of the early Etruscan aristocracy.²³⁷⁹ The same can be said of other prestige goods found in Greek sanctuaries, mainly of early Orientalizing date (late eighth-early seventh centuries), such as horsebits, bronze vessels and thrones, fibulae (maybe connected to the dedication of clothing), and so on.

IV. Civilization

Orientalizing period

Mauro Menichetti

45Art, 730–580 BCE

Abstract: The Etruscan art of the Orientalizing period spans from the end of the eighth to the beginning of the sixth century BCE (around 740/720–600/580). However, the formation of what we call Orientalizing culture took much longer, and has deep roots in the latter part of the Iron Age (between the ninth and eighth centuries). This is when, inside the so-called Villanovan culture, it is possible to find clear evidence of social differentiation and a well-structured hierarchy whose leaders possessed a power that manifested itself through the possession of arms and the practice of religious rites. These new aristocrats accumulate wealth from owning land and from having an ample repertoire of prestigious goods, technologies, and behaviors that represent a superior social level, which manifests itself in a new lifestyle.

Keywords: aristocracy, Near East, painting, architecture, sculpture

Introduction

The Etruscan art of the Orientalizing period spans from the end of the eighth to the beginning of the sixth century BCE (around 740/720–600/580). However, the formation of what we call Orientalizing culture took much longer, and has deep roots in the latter part of the Iron Age (between the ninth and eighth centuries). This is when, inside the so-called Villanovan culture, it is possible to find clear evidence of a social differentiation and a well-structured hierarchy whose leaders possessed a power that manifested itself through the possession of arms and the practice of religious rites. These new aristocrats accumulate wealth from owning land and from having an ample repertoire of prestigious goods, technologies, and behaviors that represent a superior social level, which manifests itself in a new lifestyle.²³⁸⁰

At this early stage, between the Villanovan and Orientalizing periods, there are already forms of handcrafted production and exchange that include the well-documented relationships with Greece and the Near East. The value of such products is increased by the specialized skills necessary to make them, the decorative elements they represent, or their exotic derivation. In this regard, in the Orientalizing period, the Etruscan lords (*àristoi*) create a language of power that transforms the ancient warriors chiefs into *principes* who want to adopt a lifestyle similar to that of the kings and aristocrats of the Near East, Egypt and Greece, and aim at imitating the triumphant achievements of the kings or those wonderful and superhuman feats of the heroes of Greek mythology.²³⁸¹

Within this framework, Etruscan Orientalizing art can only be understood if it is included within a complex network of relationships on a Mediterranean scale. The traditional definition of “Orientalizing” shows the most visible aspects of this art, seen in relationship with the kingdoms and the city-states of the Near East.²³⁸² However, another basic reference point for the new lifestyle elaborated by the Etruscan aristocracies is offered by the Greek world,²³⁸³ which offers artisanal techniques and cultural patterns found both in the Homeric epic and mythological stories.²³⁸⁴ The relationship with the Greek world is also facilitated by the foundation of Greek colonies (*apoikiai*) in Italy, starting from the middle of the eighth century, which gave the Etruscan-Latin world a complex technology, namely writing, very likely derived from the Euboean tradition of the new colonial settlements of Pithecusae (Ischia) and Cumae.²³⁸⁵

1An international culture

From the “Bernardini Tomb” of Praeneste (today Palestrina, in Latium) comes a Phoenician circular bowl²³⁸⁶ made of gilded silver and decorated by a concentric series of images, starting from the most external stripe, delimited by a snake in a circular form (Fig. 45.1). The images depict the celebration of the king’s deeds²³⁸⁷ as he leaves the city and passes through the countryside, where he hunts, offers sacrifices to the gods, defeats monstrous figures with divine help, and returns to his fortified city. Apart from the median stripe with horses and birds, the central scene is of great interest in its representation of a king-pharaoh who triumphs over his enemies. The bowl belongs to a typology widespread in Cyprus, Crete and Greece, and in particular in Italy during the seventh century.²³⁸⁸ It gives clear evidence of the vast circulation of images enhancing and strengthening the language of power of these warrior-kings.

This sample sufficiently demonstrates how the culture of Etruscan (and Latin) *principes* of the Orientalizing period is fully integrated into a wider framework of international relationships managed by groups that, broadly speaking, can be defined as aristocratic.²³⁸⁹ The lifestyle of Etruscan aristocrats displays a language of power that tends to transform itself in a ceremonial code. The development of a prestigious lifestyle turns into a ceremony including gestures, codified actions and performances, that includes the custom of receiving gifts, the symposium-banquet and marriage, all powerful tools to form alliances and to establish socio-political ties. Furthermore, this code provides for the use of *insignia* of military, political, and religious power²³⁹⁰ (shields, clubs, scepters, *flabella*, axes and the *lituus* (Fig. 45.2), religious symbol of the *Etrusca disciplina*); the construction of a cultural memory through the celebration of one’s own ancestors; and the representation of a privileged relationship with death and the divine world so

that *principes* can present themselves as heroes.²³⁹¹ The connective tissue of this code corresponds to a display of wealth (*tryphè* or *habrosyne*). This wealth alludes to the lifestyle of the gods, and—through the exotic provenience of behaviors, techniques and objects (for example, ostrich eggs)—shows a “geography of the world” in a way similar to that of the kings of the Near East, represented while receiving the war chest or other gifts from far off lands. The almost mythological figures of Croesus, king of Lydia, of Midas, king of Phrygia, or Arganthonios, king of Tarthish in Spain, whose incredible wealth is mentioned in literary sources, will become a model for the Etruscan *principes*.²³⁹²

Fig. 45.1: Circular bowl from Praeneste (photo SAR-Laz)

Between the ninth and seventh centuries, the Neo-Assyrian Empire assumes a leading role in the Near East, together with Egypt and the small kingdoms and city-states of the Syrian-Phoenician-Palestine belt.²³⁹³ The Neo-Assyrian empire creates an extraordinary language of power through images.²³⁹⁴ The walls of the regal palaces of Kalkhu-Nimrud, Khorsabad and Quyunjik-Ninive are completely covered in slabs with reliefs whose uninterrupted sequence narrates the war deeds of kings, the defeating of enemies, the homage defeated enemies had to pay, and the lion hunt (and other wild animals) symbolizing the absolute power of the king. From the Northern Palace of Quyunjik-Ninive comes a notable relief that depicts King Assurbanipal and the Queen at a banquet, dated to around 640 (Fig. 45.3). On the right, the king is laying on a bed (*kline*) and in front of him Queen Assur-serrat is seated on a high throne with footrest. To the left, the severed head of King Te-umman is hanging from a tree and alludes to Assurbanipal's victory. The entire scene gives the impression of a very solemn and luxurious ceremony, with people delivering the war chest or servants attending the regal couple with ceremonial fans and *flabella*. The *kline* and the throne are richly decorated with inlays or *appliques* and refer to the splendor (*habrosyne*) of the furniture, paired with the consumption of luxurious drinks. As a matter of fact, the king and queen are both drinking—most likely wine—according to the grapevine covering the scene, which is similar to the golden one produced by the bronze craftsman Theodoros of Samos for the Persian kings.²³⁹⁵ The consumption of wine in the Near East assumes the ceremonial form of the *marzeah*, one of the roots from which the symposium originates, adopted by the Greek and Latial-Etruscan aristocracies.

Fig. 45.3: Relief with king Assurbanipal and detail (after Sciacca 2007, fig. 16)

Fig. 45.4: Gold ribbed bowls from Nimrud (after Sciacca 2007, fig. 13)

The goblet held by King Assurbanipal in the relief is lost, on the contrary the Queen holds in her hand a ribbed bowl. Between the ninth and seventh centuries, this typology is widespread in Assyria, Urartu, Iran and, to a lesser degree, Syria, Anatolia, Cyprus, Greece and the Iberian Peninsula; it is completely lacking in Phoenicia. But its largest diffusion is in Italy, with almost 300 samples between the last quarter of the eighth and the middle of the seventh century. The ribbed bowls convey a definite meaning as shown, for example, by their discovery also in the Nimrud royal tombs (Fig. 45.4). In the entire Middle East, the ribbed bowl has to do with the king or his court, and signals that wine and its ownership are a privileged gift to deities or a tribute offered by defeated enemies to the victorious king.²³⁹⁶

Oriental products were already circulating during the Villanovan period, but the quick diffusion of the ribbed bowls in the early Orientalizing period reveals the adoption of a real lifestyle comparing the Etruscan *aristoi* to the Middle and Near Eastern kings. It is worth to observe that ribbed bowls only

come from Etruscan high-ranking tombs.

At first the ribbed bowls are produced in the Middle East, and begin to circulate in the western Mediterranean thanks to the tight connections between Phoenician (or Oriental) trade and Greek (mainly Euboean) trade. Later, ribbed bowls are likely manufactured by Oriental craftsmen located in the western areas. Later still, we find local production of ribbed bowls by Etruscan apprentices, which reveal variations in shape and use. This process indicates a more general phenomenon connected with the features of the contemporary trade, because technologies and artisans—as well as ideas and cultural patterns—circulate together with goods. The ribbed bowls were symbol of the Middle Eastern royalty and of the linked gift system. They suddenly disappear around the middle of the seventh century, making way for different cultural patterns in the frame of the rapid change and development of the Etruscan and Roman world during the Orientalizing period. For example around the middle of the seventh century, the nobleman Demaratus of Corinth, who is forced to abandon his own city, takes refuge in the Etruscan city of Tarquinia, marries a woman of noble birth, and one of his sons moves to Rome to become King Tarquinius Priscus. These aristocracies continue to operate on a Mediterranean scale and share a common lifestyle that glorifies wealth as an instrument through which it is possible to legitimize one's own political, social, and economic power.²³⁹⁷ On the other hand, the example of Demaratus makes the increasing influence of the Greek world clear.

2The “landscape of power”: the palace and the tomb

The new power of the Etruscan *principes* becomes fully visible through two architectural structures that define the landscape in a much more incisive and spectacular way than in earlier periods. The circular hut made of lightweight materials and with a thatched roof continues to be used during most of the seventh century, but starting in the middle of the century, square planned houses are introduced.²³⁹⁸ The House of Impluvium at Rosellae²³⁹⁹ is one such house. At Acquarossa (Viterbo) and Murlo (Siena), we also find houses with stone foundations in *opus quadratum* and walls constructed of uncooked mudbricks, or wooden frames and stones able to support heavier clay tile roofs, and cut out *akroteria* where the artisan carves the shadow of a figure in clay. Moreover, in the second half of the seventh century, we find another house plan—the *pastàs* house—well known in Greece and most likely with an Eastern influence. A rectangular space, with the entrance on the long side giving access to three rooms, the *pastàs* house seems to be particularly suitable to signal the status and the prestige of the family, as effectively exemplified in the “Tomb of the Shields and the Chairs” at Caere. Two carved

thrones flank the central door, while some carved shields—no longer military armory—hang on the wall, symbolizing the family's rank and power.

Fig. 45.5: Plan of Murlo (courtesy A. Tuck)

The transformations of this period can be fully observed in the Murlo palace, built around 590 (Fig. 45.5).²⁴⁰⁰ Around a central court with a portico on three sides is a series of rooms; on the northwestern side we find a complex of three rooms opening toward the courtyard, where there is a small building around which religious ceremonies of the *princeps*' family (*gens*) would probably have taken place. Around the courtyard, there was a series of slabs with reliefs depicting ceremonial scenes that symbolize the family's prestige. These include a banquet, horse races, a marriage procession with the bride, and an assembly of the principal gods (Fig. 45.6), the last of which was intended to show the familiarity and intimacy between the gods and the *princeps*' family. On the roof of the building and easily visible from a distance, more than twenty statues, sitting among real and imaginary animals, represent the ancestors who protect a real *regia*, and signal the power of the *princeps* throughout the territory.²⁴⁰¹

Fig. 45.6: Relief with deities from Murlo (photo SAT)

The Murlo palace requires a very high level of organization and a high quality of complex artisanal techniques. Ancient authors – in particular Pliny the Elder (*HN*35. 151–152) – shed light on these techniques. In this way we know the aforementioned nobleman Demaratus, fleeing from Korinthus, arrives in Etruria with a painter, Ekphantos, and with a team of *fictores* whose names describe their profession and skills. There is Eucheir (“good-hands”); Eugrammos (“good drawer”) and Diopos (likely meaning “good architect”). From this story, we can identify the latest architecture, painting, and sculpture techniques from the Greek world. In this context, a new form of clay decoration begins to expand, giving also the possibility of making statues, *akroteria*, and slabs with reliefs.

In addition to the palace, the tomb is the other great symbol of aristocratic power. One can observe how monumental tombs with multiple depositions replace pit tombs and well tombs. These monumental tombs resemble the inside of the house and express the strength of family ties.²⁴⁰² Since earlier times, the tombs are covered by great barrows that occupy the necropolis of Etruria’s main cities.²⁴⁰³ The cremation of the deceased—which recalls the Homeric rite noted for Patroclus funeral—is only the final step of a complex procedure that involves the transport of the dead (Gk. *ekphorà*) to the tomb where a long and complex series of ritual ceremonies take place. The areas in front of the tombs are often set up in a way that the *gens* can easily attend the ceremony.²⁴⁰⁴ In other cases, a podium with steps allows people and the religious officers to stand on the mound in order to perform the religious rites. Finally, the deposition of the body inside the tomb is accompanied by the deposition of the funerary set, the value of which is evident by the number of objects and the quality of precious materials.

Fig. 45.7: Statues from Casale Marittimo (photo SAT)

Inside the burial mound there are multiple tombs, which makes the meaning of *nomen gentilicium* (established during the seventh century) clear (Fig. 47.1). That is to say that the aristocratic groups are able to identify themselves through the presence of an ancestor, whose memory is made permanent by his *nomen*. The tumulus represents the cultural memory of the *princeps* and his dynasty, which is transmitted not only through the architectural form of the tomb, but also through its sculptures and paintings. The architectural form of the tumulus probably derives from examples found in the Near East and Anatolia, also well known in Greece, as showing the case of Salamina of Cyprus.²⁴⁰⁵ Homer also mentions a tumulus situated on a headland facing the sea in honor of Achilles.²⁴⁰⁶

The majority of accounts regarding Etruscan sculpture of the Orientalizing period come from funerary contexts. Around 680 at Ceri, near Caere, two *imagines maiorum* are carved in the interior of a tomb that derive from northern Syrian examples (Fig. 35.4).²⁴⁰⁷ The tomb of the Five Chairs in Caere dates to 640.²⁴⁰⁸ One room contains five chairs on which clay statuettes were seated, two *mensae*, two empty chairs for the dead lying in the adjacent room, a small altar and a container. The entire set is extraordinarily interesting, because it literally represents the *post mortem* reunion of the family.

Fig. 45.8: Tomb of the Roaring Lions (courtesy TPA, Carabinieri)

Two statues, recently found during the excavations at Casale Marittimo in the area of Volterra, date to the same period (Fig. 45.7).²⁴⁰⁹ The statues, made of limestone, are represented with belts and loincloths. It is still unknown whether they were ever located on the burial mound. Finally, dating back to the last quarter of the seventh century are eight limestone statues standing in a position of mourning, arranged along the *dromos* of the “Tumulo della Pietrera” in Vetulonia. All of these sculpture groups derive from Near Eastern models and might as easily have been made by Oriental artisans in Etruria as by local craftsmen deeply influenced by Near Eastern patterns. At any rate, the Etruscan *principes* love and require this type of iconography.²⁴¹⁰

Painting also enriches the decorative apparatus of the tombs. The most ancient examples come from Veii and Caere, and later on from Tarquinia. First of all, painting a tomb makes it as luxurious as the deceased’s house, and early on, its walls are embellished with vegetable elements, animals and narrative scenes.²⁴¹¹

The Roaring Lions Tomb in Veii is one of the most ancient examples of funerary painting, dating to the beginning of the seventh century (Fig.

45.8).²⁴¹² Its decoration includes outlines of ducks and lions, which reveals a stylistic influence from Greek late Geometric vase painting, mainly the Euboean tradition. The “Tomb of the Ducks,” again in Veii, clearly shows the use of outline and silhouette techniques as well.

The painting technique, based on red, yellow, white and black colors, is likely linked to techniques of other productions, like pottery, and especially the “white-on-red vases.”²⁴¹³ Caere documentation includes the “Tomb of the Painted Lions” and the “Tomb of the Painted Animals.” The paintings in the “Tomb of the Ship” probably refer to the episode of Ulysses and the Sirens. In the second half of the seventh century, among the different stylistic traditions from Near East and Greece, the Corinthian component emerges. The “Tomb of the Panthers” in Tarquinia and, more significantly, the “Campana Tomb” of Veio, which features an important narrative scene, are remarkable examples of the Late Orientalizing period.

3Wine and the symposium-banquet

Wine is a very precious drink that is appropriate to kings such as Assurbanipal or Alkynoos, who offers wine to Odysseus, a guest, and to the god Zeus.²⁴¹⁴ The historian Titus Livius recalls that the consul L. Papirius Cursor offers a little cup of wine to the gods in order to win their favor and a victory at war.²⁴¹⁵ In the Etruscan world, there is no clear distinction between banquet and symposium but the *principes* know the Greek and Eastern models, which associate the ceremonial consumption of wine with singing, music, and the use of perfumes and sets of specific bronze or fine ceramic vases.²⁴¹⁶

We probably have to distinguish between different types of wine and their way of consumption, starting from a very ancient indigenous wine, called *temetum*.²⁴¹⁷ The Montescudaio urn (Fig. 45.9), from the mid seventh century, shows an Etruscan lord banqueting in the “Homeric way,” surrounded by a servant holding the Eastern ceremonial *flabellum* in his hands, near a table (*trapeza*) bountifully set with food and a large container for wine. Early on, the Near Eastern style of banqueting with the *kline* begins to circulate, as shown by the famous Krater of Eurytios from Caere. Furthermore, the use of particular objects like the “plate-tripods” as mortars²⁴¹⁸ or graters recalls the custom of adding spices, aromas or cheese to wine, a practice well known in the Near East. Cup and practice have been described by Homer about the famous “Nestor’s Cup.”²⁴¹⁹

Fig. 45.9: Urn from Montescudaio (photo SAT)

Oriental or Phoenician and Greek wine spread the Tyrrhenian area with their set of vessels²⁴²⁰. During the second half of the seventh century, kraters and cups belonging to the Greek tradition mostly show how the symposium had become a fundamental element of the aristocratic lifestyle.

The famous Chigi Olpe, which arrived in Etruria in the mid seventh century, shows a repertoire of images that are very close to the aristocrats' hearts (war, hunting, marriage—which is referred to through Paris' judgment). The Aristonothos Krater, probably made in Caere by a Greek artisan, shows the blinding of Polyphemus by Ulysses and his companions on one side (Fig. 35.3), and a battleship scene on the other (Fig. 22.3a). The decoration with images represents a further form of *habrosyne* within the context of ceremonial wine drinking.

It is important to remember that the Etruscan way of wine consumption

produces the creation or adaptation of some vase shapes, testifying the fundamental importance of this practice for the aristocratic lifestyle. The bucchero *kyathos* from the San Paolo Tomb 1 of Caere is a magnificent sample also displaying an inscription recalling the gift system typical of the aristocratic rank.

4The principes and the heroes of Greek mythology

The language of power created by the aristocrats from Etruria (and Latium) becomes even more well structured during the Orientalizing period with the insertion of another element that makes that language stronger and more powerful to legitimize the rank of the *principes*.

The heroes of the Greek mythology—Theseus, Achilles, Odysseus, the Argonauts and Herakles—become the examples for the enterprises and the lifestyle of the Etruscan *aristoi*.²⁴²¹ The pyxis from the Pania tomb of Chiusi²⁴²² (Fig. 45.10), which dates to the end of the seventh century, is made of ivory, and bears a rich repertoire of carved images. Among others, the departure of a warrior on his chariot surrounded by his personal army is depicted, and on the higher frieze, two scenes that represent important endeavors during Odysseus' wanderings are shown: the escape from Polyphemos' cave, and the encounter with the sea-monster Scylla. It is evident that the endeavor of the princeps-warrior is compared to Odysseus' endeavors. This new language of power will be later translated into monumental forms in the friezes of the Etruscan and Latium *regiae* during the sixth century,²⁴²³ as we see for example in the clay reliefs from Acquarossa with Herakles' labors (the Nemean Lion and the Cretan Bull) that accompany the *princeps*' departure. This kind of language has a further message, according to which the princeps-warrior acquires a status similar to the Greek heroes' status through apotheosis.²⁴²⁴ Here we can also track down a pattern similar to the new performance of the triumph that the Etruscan kings introduce to Rome: that is to say the celebration of the military victory in the framework of the institutional structures of the city, in which the triumphant king is assimilated to Jupiter.

Fig. 45.10: Pyxis of Pania (photo SAT)

5Conclusions

In conclusion, the Orientalizing Etruscan culture, which has a deep influence on the other cultures with which it comes in contact—such as Latial and the Italic populations—can be exemplified through an extraordinary monument: the chariot found in Monteleone near Spoleto (Central Italy), now at the Metropolitan Museum of Art in New York. Central Italy has therefore given us a rich documentation about this fundamental sign of power.²⁴²⁵ On the bronze parapet of the chariot—its chronology is fixed at the second half of the sixth century—an incredible series of images shows the heroic qualities of Achilles in three main scenes (Fig. 45.11): the chase, his duel with Memnon,

and his apotheosis with winged horses. On the front, Achilles receives the precious arms made by the god Ephestus from his mother, Thetis, according to Homer's narration. The Etruscan *principes* climb on the chariot to be like Achilles or the king represented on the gilded bowl from the Bernardini Tomb.

46Handicraft, 730–580 BCE

Abstract: In the last decades of the eighth and the beginning of the seventh centuries, the Tyrrhenian elite reached an unprecedented level of wealth and manifested a sudden need for status symbols that could represent their new lifestyle. The solution was to model themselves after Near Eastern dynasties and their courts. The Near East supplied models of life as well as sumptuary goods, raw materials and, most notably, skilled craftsmen specialized in many sectors, who started workshops in Etruria and gave rise to local production. At the same time, contacts with Greece started an extraordinary phenomenon of acculturation expressed through material culture, as well as through the acquisition of writing and Hellenic mental forms.

This work aims to illustrate how, in the different categories of handicraft—jewelry and other precious materials, metalwork and pottery—these Near Eastern and Greek elements combined with local traditions to create an original Etruscan Orientalizing style.

It was an uneven process, however. In the earliest phase of the Orientalizing period (around 725–680 BCE), it mainly involved Veii and Tarquinia; in the seventh century, the most important poles of production were Cerveteri and Vetulonia, from which technical and stylistic innovations widely radiated in both Etruscan territory as in foreign areas.

Keywords: Etruscan Orientalizing period, Etruscan handicraft, Etruscan jewelry, Etruscan pottery, Etruscan metalware

Introduction

In the last decades of the eighth and the beginning of the seventh centuries, the Tyrrhenian elite reached an unprecedented level of wealth and manifested a sudden need for status symbols that could represent—physically and symbolically—their new lifestyle. It is clear they modeled themselves after Near Eastern dynasties and their courts. The Near East supplied sumptuary goods, raw materials, and, most notably, specialized craftsmen who were masters of advanced techniques with a mature tradition rooted in a multicultural setting. Their encounter with the Villanovan tradition and that of Greeks (also found in Etruria) initiated the formation of an Etruscan Orientalizing style. Due to the lack of recognizable public institutions and the particular importance consequently gained by the private sphere of these new *aristoi* in the political and religious lives of their communities, this new Orientalizing style can be evaluated above all in the handicrafts.²⁴²⁶

1Jewelry

Already in the second half of the eighth century, this ongoing change can be detected by the increase in jewelry made of precious metals. Villanovan objects typically made of bronze (e.g. fibulas, hair spirals and pendants) were now made of gold and silver. These were further decorated with granulation and filigree, two refined goldsmithing techniques previously unknown in Etruria, which were certainly introduced by Near Eastern artisans.

Alongside these techniques, there was a diffusion of exuberant, Near Eastern decoration, including rosettes, palmettes, guilloches, Egyptian protomes and animal and anthropomorphic figures. These were also made with traditional repoussé techniques on Near Eastern (like anchor-shaped pendants or *bullae* with embossed star motifs), as well as on local forms.

Until the mid seventh century, the typology of jewelry grew and defined itself. The display of a family's wealth peaked in female burials with a variety of fibulas (leech, boat and lozenge-shaped fibulas), necklaces, pendants, armlets, earrings, hair spirals and small metal plaques for decorating clothing. Many varieties of serpentine fibula are typical of men's costumes, like the comb and bolt fibulas, used to pin mantels onto their shoulders or on their belts.²⁴²⁷ Sumptuous chest ornaments have been found for both sexes on the highest rungs of the social hierarchy. Certain men's grave goods highlight the deceased's role as a warrior, as in the case of the embossed gold lamina put on the bronze *kardiophylax* from the Tomb of the Warrior at Tarquinia.²⁴²⁸

The pomp reached its peak during the first half of the seventh century, with princely grave goods that include refined jewels of extraordinary value, which can often be traced to the same workshops. These jewels satisfied a large demand, and— thanks to the widespread practice of aristocratic, ceremonial gift-exchange—reached southern and northern Etruria, Latium and Campania, with more sporadic occurrences in Etruria Padana and on the Adriatic coast.

The workshops can be located in various Etruscan centers. In the Early Orientalizing period there were particularly active workshops in Tarquinia, where goldsmiths from northern Syria might have worked, and in Veii, where they also worked amber from the Adriatic coast (Verucchio).²⁴²⁹ Amber was used for fibulas, necklaces, gold pendants and the inlaid gold pectorals from tomb 101 at Castel di Decima, tomb Galeassi at Praeneste, and the Montetosto tumulus at Caere.²⁴³⁰

Fig. 46.1: Gold breastplate and disk-fibula from Caere, Regolini-Galassi Tomb. Vatican, Museo Gregoriano Etrusco (from Cristofani and Martelli 1983)

From the second quarter of the seventh century, Caere's workshops clearly demonstrated their leadership, here too initiated by Near Eastern goldsmiths and characterized by technical perfection, virtuosic use of granulation and filigree, and the ability to assimilate and build upon ideas from different provenances. These characteristics were largely expanded upon in the extraordinary gold female grave goods from the woman's burial in the Regolini-Galassi Tomb. These include the famous embossed breastplate with its semi-elliptical form of Egyptian influence and the giant disk fibula of the late Villanovan tradition (**Fig. 46.1**), attributed to a workshop that masterfully combined Near Eastern, Greek, and local forms, techniques and motifs. Among the products of the same workshop, there are valuable examples of jewelry (disk, serpentine, comb and bolt fibulas), from Caere, Praeneste, Vulci (where the spectacular fibula from Ponte Sodo with a dueling scene, a local variation of a style found in Cypro-Phoenician bowls, was found: **Fig. 48.5**), Vetulonia and Marsiliana, with zoomorphic figures made by joining two symmetrical halves through micro welding and finished with granulation. These find their highest achievement in the sumptuous pectorals from the Barberini and Bernardini Tombs at Praeneste (**Fig. 46.2**).²⁴³¹

Fig. 46.3: Gold fibula from the Tomba del Littore of Vetulonia. Florence, Nat. Archaeol. Mus. (photo SAT)

Goldsmith workshops were also active in Vetulonia starting around the same time, perhaps due to the transfer of artisans from Caere who were attracted by favorable economic circumstances or in the wake of eminent personalities, like the deceased of the Tomba del Duce, who was cremated in a silver house-shaped urn attributed to a Caeretan workshop.²⁴³² The goldsmiths of Vetulonia developed a particular local style with embossed motifs (palmettes and female protomes), and a sophisticated use of the “pulviscolo” technique, a variant of granulation, which is better suited for making figures (Fig. 46.3). Their products rapidly acquired a wide diffusion in northern areas, from Marsiliana, Roselle, Volterra to Chiusi and the Chiana Valley and up through Bologna and Verucchio.²⁴³³

2Ivory, bone and glass

Among the luxury goods crafted by Near Eastern artisans, there are also precious objects of ivory and bone: pyxides, chests, fans, combs, statuettes, as well as plectra and dice games (e.g. in the Regolini-Galassi Tomb). The ample production of Southern Etruria, in all likelihood based in Cerveteri, has been divided by modern scholars into two main groups, which can be linked to the same stylistic trends of Syrian and Phoenician inspiration also seen in imported goods.²⁴³⁴ The homogeneous group of refined ivories from Marsiliana, dating to the mid seventh century,²⁴³⁵ can be attributed to craftsmen with Near Eastern training from southern Etruria who were likely active in Vetulonia. Northern Etrurian workshops are attributed for the remarkable collection of ivories, from the second half of the seventh century, found in tombs of the middle Arno and Ombrone Valleys, and from

Murlo.²⁴³⁶ These ivories are evidently related to the Late Orientalizing production of Chiusi²⁴³⁷ through style and decoration, characterized by clear references to the Greek myths (Fig. 46.4).

A few ivory plectra (see [chapter 30](#) Li Castro) from rich Etruscan tombs remind us of the existence of related instruments and many other wood objects, surely an important category of handicrafts that has been almost completely lost.²⁴³⁸

Correlate to that of the ivories is the manufacture of oinochoai and cups made from ostrich eggs, with painted, incised and excised decorations. Eggs from Carthage that were cut to form hemispherical cups in the first half of the seventh century were followed, in the second part of the century, by a series of richly decorated, Etruscan incised eggs (found in Vulci, the Florentine countryside and Picene territories), which were mounted in oinochoai with different precious materials, including ivory and gold (see [chapter 50](#) Micozzi). The workshops can likely be located in Vulci—which also rendered clay versions of these same forms.²⁴³⁹

The prestige of Caeretan workshops is also visible through the widespread diffusion (southern and northern Etruria, Latium, Campania and Picenum) of a series of precious glass objects (perfume bottles or balsamaria, tools for spinning and ornaments) made between the mid seventh century and the early decades of the sixth in the “friable nucleus” technique, which was certainly introduced by Near Eastern immigrant glass workers.²⁴⁴⁰

3Metal vases

Much of the work of Orientalizing craftsmen was dedicated to creating

vessels and utensils for eating, drinking, pouring, mixing and filtering liquids, roasting or boiling meat, used in banquet ceremonies, the finest expression of the aristocratic way of life.

The goldsmiths also produced gold (such as the Bernardini kotyle, with sphinxes on handles, and the ribbed bowl from Praeneste now in the Victoria and Albert Museum²⁴⁴¹) and silver vessels and utensils. Along with prestigious, Near Eastern metalware and proto-Corinthian pottery, these compose the exclusive sets used for the consumption of wine according to Greek and Oriental ceremonies present in princely grave goods in Etruria, Latium and Campania.²⁴⁴²

Even in this case, the oldest evidence is clustered in Tarquinia (Warrior's and Poggio Cretoncini Tombs) and among key grave goods from Latium and Campania (Castel di Decima, Cumae and Capua).²⁴⁴³ In the second quarter of the seventh century, these were followed by the output of Caeretan workshops guided by Near Eastern craftsmen. On the one hand, the Caeretan workshops referred back to tradition (for example with the spiral amphora and the cups with vertical handles from Regolini-Galassi). On the other hand, they oriented themselves towards foreign shapes—skyphoi and kotylai that imitate proto-Corinthian models (exported to Praeneste, Pontecagnano, Marsiliana, Vetulonia Populonia and Fabriano), as well as paterae and hemispherical bowls with incised scale patterns just below the rim (found in Caere, Praeneste, Marsiliana, Veulonia, Narce and Capua), with Near Eastern prototypes in glass, bronze and ceramic (Fig. 46.5).²⁴⁴⁴

The decoration of some kotylai, inspired by the Phoenician bowls, but with contributions from the Greek and local repertoire, shows the eclectic vibrancy of Caere's workshops. These are also attributed with the gilded silver situla belonging to Plika-sna of Chiusi, a unique piece that illustrates the acme of this aggregation.²⁴⁴⁵

Two bronze kotylai—one from the Bernardini Tomb and the other from tumulus F at Satricum—and the Barberini tripod with Sirens can also be attributed to Near Eastern craftsmen active at Caere, who combined Greek forms with the Near Eastern “double wall” technique.²⁴⁴⁶ The widespread imitation of other Near Eastern valuables, like Assyrian-made ribbed bowls, suggests their manufacture in various Etruscan towns, including Caere and Vetulonia.²⁴⁴⁷ For the duration of the Orientalizing period, Vetulonia's bronze workers acted as the northern counterpart of Caere's metalworkers; their production is easily recognized and includes a wide range of products, as censers, urns with handles decorated with lotus flowers and zoomorphic protomes, and tripods, some of which imitate and elaborate upon trans-Alpine types, bearing witness to the city's extensive external contacts.²⁴⁴⁸

Fig. 46.5: Set of silver-gilt vessels from the Regolini-Galassi Tomb of Caere (Rome, Vatican, Museo Gregoriano Etrusco) (elaboration from Cristofani and Martelli 1983)

4Bronze objects

Bronze workers were also responsible for the production of a series of objects associated with the exaltation of the male warrior (weapons, war chariots or vehicles for transport—also destined for the *ekphorà* of the deceased—and equestrian harnesses). In the Orientalizing period, these instruments of war largely became symbols of rank. The weapons were often inadequate for warfare and suggest the existence of a vein of production dedicated to funerary or votive functions, as seen in shields from female burials and in the deposits of Verucchio and on the Civita of Tarquinia. In the latter, the shield was found near a musical *lituus* and an ax, other objects used in aristocratic spheres as insignia of power, as can be seen in Casale Marittimo or in the Tomba del Littore of Vetulonia.²⁴⁴⁹

Furthermore, the embossed barrel-shaped sheet bronze thrones certainly indicated status, rather than serve as functional objects. They were often associated with similarly decorated stools and fans and, at times, with scepters and *litui* to form sets directly related to the royalty,²⁴⁵⁰ as documented in the iconography of the statues from Ceri and Veii Picazzano and the akroteria from Murlo (see [chapter 45](#) Menichetti). They may have often been made of perishable materials, as seen in the wooden finds at Verucchio (see [chapter 76](#) von Eles). Wheeled bronze trays also belong to the same category; identified by M. Torelli with the *praefericula*, they were objects with specific cult functions, prerogatives for certain, eminent figures.²⁴⁵¹

Fig. 46.6: Silver scepter, flabellum and bronze sheets from Veii, Monte Michele, Tomb 5 (Rome, Museo Etrusco di Villa Giulia) (photo SAR-Laz)

It is likely that bronze workshops were present in the major Etruscan, Latin and Faliscan cities, but it is difficult to distinguish their production because the stamped technique continued to prevail despite the introduction of Near Eastern decorations, and lends a conservative and uniform veneer to the sheet bronze objects (urns, flasks, tripods and more). For example, Ingrid Strøm suggests that Veii was the main source of barrel-shaped thrones, for which Fritz Jurgel proposes Tarquinia, a city that, like Vulci, certainly hosted remarkable bronze workshops. A large number of the bronze shields that Armgart Geiger attributes to Marsiliana likely came from these two centers.²⁴⁵²

Local workshops can be traced back to valuable collections of bronzes from the princely tomb of Monte Michele at Veii (house-shaped urn, wheeled tray, scepter and flabellum (Fig. 46.6)²⁴⁵³ and that of the Carro di bronzo (Bronze Chariot) at Vulci.²⁴⁵⁴ The latter striking set of grave goods illustrates a particular application of the technique—the *sphyrelaton*, in which parts of the human body are assembled from different materials to reconstruct an image of the body of the cremated deceased, as seen in some other high ranking burials of the first half of the seventh century concentrated in the area around Vulci.²⁴⁵⁵ Above all, we can recall the bust from the Circle of the Fibula at Marsiliana, considered the work of bronze workers who were experts in weaponry.²⁴⁵⁶ Such cases show the difficulty of distinguishing between the “fine arts” and handicrafts in this chronological period.

There was a sharp change in Caere tan metal workers, which introduced figured decoration in free-hand drawing. The Regolini-Galassi Tomb is once again the foremost example, with the cauldrons on conical stands, the bronze sheets reused in the restoration of the throne, which originally belonged to a chariot,²⁴⁵⁷ the wheeled tray decorated with realistic and fantastic animals

immersed in phytomorphic patterns of Near Eastern inspiration (and those from the same workshop found at Praeneste and Vetulonia).²⁴⁵⁸ These express a tendency found in all Caeretan handcraft: to metabolize influences from various sources into the dominant Syro-Phoenician vein until the creation of an original Caeretan, Orientalizing style. With regard to metalworking, this can be seen, at the very end of the seventh century, in the decorative exuberance of chariot panels of Tomb XI at Eretum/Colle del Forno.²⁴⁵⁹ Through exported goods and the migration of craftsmen, Caeretan Late Orientalizing bronzeworking influenced other centers, including Orvieto and Chiusi, which produced many sheet bronzes, especially amphorae and thrones for canopic urns, also demonstrating a certain Vetulonian influence.²⁴⁶⁰

5Painted pottery

The leadership of Caere is particularly evident in pottery painting, where the Caeretan workshops show a capacity for renewal unknown to other centers, certainly due to privileged relationships with new Greek people active in the Tyrrhenian Sea. Even amidst the battery of Orientalization, vase painting maintained a strict adherence to Greek models limiting its Near Eastern influence to the adoption of a few new types of vases—especially plates—demonstrating a preference for a way of eating different from that of the Greeks.²⁴⁶¹

From the third quarter of the eighth century, Vulci's ceramic workshops had a period of remarkable creativity, due to the presence of several immigrant leaders who gave rise to the so-called Etruscan geometric production by introducing decorative patterns, iconographies and vascular forms from different regions of Greece. By the end of the century, the most important workshops—conventionally called “of the First Craters,” “of the Ticinian Craters,” “of the Vulcian Biconical” and “of the Argive Painter”—equipped the Etruscan repertoire with a wide range of new forms, especially for use in symposia (craters, amphorae, oinochoai and various types of drinking vessels), decorated in the Greek Late Geometric style and including the first narrative scenes with figures.²⁴⁶² From the early seventh century, Vulcian pottery fossilized into a routine production that repeated Euboean and proto-Corinthian geometric patterns organized in a metopal scheme, the “Metopengattung,” which dominated in Vulci and Tarquinia until the middle of the century.²⁴⁶³

For most of the seventh century, Tarquinian workshops settled into a nearly slavish imitation of proto-Corinthian and Cumaeian vases. Only through the first decades of the century did they begin to open up to innovative stimuli, with the Painter of Bocchoris and the Palm Painter, who distinguished themselves by introducing Attic and Near Eastern influences.²⁴⁶⁴ Very similar

to the production of a Tarquinian workshop is the oinochoe by the Painter “dei Cavalli Allungati,”²⁴⁶⁵ which features one of the first mythical scenes—perhaps the *geranos* of Theseus and Ariadne—now in the British Museum.

Since the early seventh century, the Caeretan Subgeometric pottery (plates, amphorae, stamoid ollas, stemmed bowls, oinochoai)²⁴⁶⁶, was enlivened by friezes of fish and marsh birds (the “Heron Class,” also diffused in non-Etruscan areas)²⁴⁶⁷, and flanked, in the very same workshops, by a new figurative style inspired by Proto-Orientalizing, Attic and Cycladic experience. The Greek models were known thanks to Attic vase painters, like the recently identified Goat Painter,²⁴⁶⁸ or the Narce Painter.²⁴⁶⁹ In the first decades of the seventh century, they settled in Caere and Veii, where they adapted Protoattic figures and stylistic elements to local forms (biconical vases, amphorae, plates). Thanks to the Tomb of the Roaring Lions at Veii, we can compare ollas painted by the Narce Painter (Fig. 46.7) to wall paintings, which demonstrate—even better than the contemporary Tomb of the Ducks—the close relationship between vase painting and wall painting,²⁴⁷⁰ a relationship which remained strong over the course of the Orientalizing period.

Fig. 46.7: Olla from the Tomb of the Roaring Lions at Veii, attributed to the Narce Painter (photo SAR-Laz)

The presence of the aforementioned Greek vase painters at Veii, Caere and Narce, areas which are characterized by strong cultural interrelations,

provides an appropriate base for the renewal of Caeretan vase painting in the first half of the seventh century. With the Cranes Painter and the Heptachord Painter, Caere inaugurated monumental, figured registers of Cycladic and Protoattic inspiration in both subject and style.²⁴⁷¹ The Crane Painter was the leader of a prolific workshop, who worked both clay and impasto with white-on-red decoration and preferred large vessels, especially amphorae that reached the Veian-Faliscan area too.²⁴⁷² He experimented with human and theriomorphic figures that were inspired by the Hellenic world (a centaur and a warrior on two “white-on-red” pithoi now in the Castellani collection), but did not depict complete narratives, unlike the Heptachord Painter, who must have drawn from Greek epics (Fig. 16.3). Although it is not certain, the Heptachord Painter may have depicted the meeting between Helen and Menelaus on a biconical vase from Monte Abatone, or Orpheus and the Argonauts on the eponymous vase.²⁴⁷³

Caeretan pottery lets us trace the key stages through which Etruscan aristocracy selected from the corpus of Greek myths. At the beginning of this extraordinary process of acculturation, the Etruscans preferred episodes related to epic sea voyages like those of Odysseus, Jason and Theseus.²⁴⁷⁴ A skillful patron who could understand Greek myths and reinterpret them for self-celebration appropriated the famous crater with the blinding of Polyphemos and naval battle, signed by Aristonothos,²⁴⁷⁵ an Attic vase painter of Cycladic origin who was active around 650 at Caere. His signature is the first known example in Etruria, where pottery painters rarely signed their works, even in later centuries.²⁴⁷⁶ The Aristonothos crater began a local series of vases that depicts epic mythological episodes, both in clay, like the amphora by the Amsterdam Painter with Medea and the dragon of Colchis,²⁴⁷⁷ as well as in “white-on-red” impasto, like that of the Sirena-Assurattasche Painter with Odysseus’ encounter with the Sirens.²⁴⁷⁸ In the second half of the seventh century, Caeretan series of red impasto vases with white decorations developed a particular sensitivity to mythological scenes, largely attributable to the Workshop of the Calabresi Urn, which specialized in large containers (pithoi, amphorae, pyxides and house-shaped urns).²⁴⁷⁹ The Painter of the Birth of Menerva (active between 640 and 620), a leading figure in this workshop and, perhaps, painter of wall paintings (Tombs of the Painted Lions and of the Painted Animals),²⁴⁸⁰ depicted the birth of Athena on pyxis D 150 (now in the Louvre), and the blinding of Polyphemos on a Fleischmann collection pithos (Fig. 14.4).²⁴⁸¹ These scenes were translated into the composite language largely derived from a Phoenician matrix, which would become the distinctive feature of the Caeretan Orientalizing style.

The Tragliatella oinochoe exemplifies the self-representation of an aristocratic Etruscan *gens* through a Greek mythological model.²⁴⁸² It also acts as a primary document of the formation of local sagas that were executed in a polychrome Corinthian technique, which dominated the Caere-Veii territory at the close of the seventh century, with the Caeretan Group of Monte

Abatone and the Castellani Cycle of Veii.²⁴⁸³ The unbroken succession of cultural ties and migrating artisans from different parts of the Greek world is the most decisive factor for the undisputed supremacy of the Hellenic model as a reference for the rising class: over the last decades of the century, the Swallow Painter and the Bearded Sphinx Painter—respectively bearers of Eastern-Greek and Late proto-Corinthian /Transitional models—are the origin of Etruscan-Corinthian production at Vulci, mainly in black-figure technique and poor in narrative scenes (with exceptions like the oinochoe with the Ilioupersis by the Bearded Sphinx Painter).²⁴⁸⁴

6Other pottery

Social change in the late Orientalizing period and the consequent increase of those who had access to the wealth sparked a decisive transformation in Etruscan artisan activity, which restructured itself through tighter organization and greater specialization of labor. In Vulci's Etrusco-Corinthian workshops, this dynamic translated into an actual subdivision of the market. On a broad scale, we also see the rise of wine and oil containers (as well as the smaller ones for perfumes) to meet the surplus produced by intensive agriculture and destined for trade. One effect of this industrial-style production is the standardization of vase types, particularly evident in the bucchero, the characteristic ceramic whose black color comes from reduction firing, the most profitable “invention” of the Etruscan Orientalizing period.²⁴⁸⁵

Bucchero appeared in Caere at the end of the first quarter of the seventh century, without an experimental phase, with high quality products (the so-called thin bucchero, often with silver finishes). There is a clear inclination towards pottery for banquets, with forms derived from three main sources—proto-Corinthian ceramics, precious Near Eastern imports (such as the Cypro-Phoenician oinochoai and rare ribbed phialai with human protomes), and local brown impasto, within which the bucchero tradition belongs. Hence, bucchero vases catered to both endemic and foreign modes of drinking wine (provided that Mario Torelli's association between spiral amphorae and *temetum* holds true)²⁴⁸⁶.

Once considered surrogate to precious vessels made of ivory and metal, bucchero was conceived as a prestigious product, a flexible material from which objects of great symbolic value could be made, like the mourning statuettes from the Regolini-Galassi Tomb and from the Tumulus of Poggio Gallinaro²⁴⁸⁷ and the calamus from the Regolini-Galassi Tumulus. The production of refined works in relief intended for elite patrons began in the mid seventh century.²⁴⁸⁸ It includes exceptional pieces like the olpe from Tomb 2 of the Tumulus of San Paolo at Caere, with rare versions of the sagas of Daedalus and Medea²⁴⁸⁹ (Fig. 46.8) and a group of kyathoi decorated in

relief, incision, excision and punching from Caere, Vetulonia, S. Teresa di Gavorrano, Casale Marittimo, Monteriggioni, Chiusi, Murlo. Some of these bear inscriptions that qualify them as precious ceremonial gifts from the Paithina gens—partly, perhaps, made in northern Etruria.²⁴⁹⁰

Fig. 46.8: Bucchero olpe showing in relief Medea, the Argonauts and Daedalus. From Caere, Tumulus of San Paolo, Tomb 2 (Rome, Museo Etrusco di Villa Giulia) (photo SAR-Laz)

As mentioned above, food storage vessels were made of impasto and usually reddish in color. Red impasto ware is present throughout Etruria with local variations in morphology and decoration,²⁴⁹¹ but always with a series of large dimension vases (pithoi, ollas, and braziers), sometimes with painted decoration (in addition to the Caeretan, there was also a “white on red” production in the Faliscan-Capenas area and in inner Etruria)²⁴⁹² and, by the end of the seventh century, with stamped patterns.²⁴⁹³

Abstract: The Etruscan elite furnished their tombs with extraordinary sumptuousness, following a specifically “barbarian” custom—adopted throughout their civilization—that began in the second half of the eighth century BCE and reached its peak in the seventh. The three major arts—stone sculpture, architecture, and painting—developed in this period mostly for use in burials. The sets of grave goods include luxury items of Near Eastern and other provenances, which testify to the considerable capacity for assimilating outside influences and the role the Etruscans played in the Mediterranean and Europe. Archaeological evidence shows that the Etruscans received objects and ideas relating to a new way of life from the Near East, while their mythology came from Greece; they received cultural models from both. This original mixture determined a new type of culture, which allowed both men and women to play important roles in society.

Keywords: Orientalizing, elites, lower classes, competition, family name

Introduction

The Etruscan elite furnished their tombs with extraordinary sumptuousness, following a specifically “barbarian” custom—adopted throughout their civilization—that began in the second half of the eighth century BCE and reached its peak in the seventh.²⁴⁹⁴ The three major arts—stone sculpture, architecture, and wall painting—originated and developed in this period mostly for use in burials.²⁴⁹⁵ The sets of grave goods are our main source for Etruscan society. They include luxury items of Near Eastern and other provenances, which testify to the considerable capacity for assimilating outside influences and the role the Etruscans played in the Mediterranean and Europe.²⁴⁹⁶ Archaeological evidence shows that the Etruscans received objects and ideas relating to a new way of life from the Near East, while mythology came from Greece; and from both they received cultural models. This original mixture determined a new type of culture, which allowed both men and women to play important roles in society.

1Elites, lower classes and geographic mobility

In the Orientalizing period, the Etruscan elite adopted certain markers to demonstrate their power and high status. Three elements stand out, permitting

the conclusion that beginning in the second half of the eighth century, Etruscan elites become more conscious of their social status.

First, because excavations of domestic remains in Etruscan cities are still in progress, and general knowledge about the urban residences is limited,²⁴⁹⁷ the burials are the commonest source of information. Huge tumuli with diameters reaching 50–60 m contained the chamber tombs. Often, these monumental graves accommodate only one chamber tomb for a man or woman, and subsequently they received further chamber tombs that probably belonged to the same family, as shown by the four tombs of Great Tumulus 2 in the Banditaccia cemetery at Caere (Fig. 47.1). From the beginning of the seventh century to the first half of the sixth, a new chamber tomb was built every thirty years or so in that barrow. In the burial landscape, tumuli became a visible marker of the power of the family that owned it and probably of its ancestors, following a model developed by Near Eastern societies.²⁴⁹⁸ For the interiors of the chamber tombs, see [Section 5](#) below.

Second, the tombs were full of luxury goods, which had already been displayed in the residences and in the funeral rites that came to Etruria from various overseas regions and Central Europe.²⁴⁹⁹ Several items are closely connected to the diffusion of new modes and costumes, which cannot always be clearly interpreted or understood. Middle and Late Geometric Greek drinking cups testify, for instance, to the display of wine.²⁵⁰⁰ Greek vases for use in symposia are likely to have been ceremonial gifts offered by Greeks to the local elite, not only to establish relations with them, but also to have access to the natural resources they controlled. This is supported by the geographical distribution of such items, which is not limited to the major centers such as Veii, Caere, and Tarquinia, but also includes peripheral districts, such as the huge Euboean krater found out its original context at Pescia Romana (Grosseto province, Tuscany), which dates to the last quarter of the eighth century, and the vases found in the coastal settlement of La Castellina del Marangone (Rome province, Latium), corresponding to the mine district of the Tolfa Hills in the hinterland.²⁵⁰¹ There is little information about the functional use of imported goods in Etruria. The huge Near Eastern bronze cauldrons with lion protomes and/or griffin protomes, for instance, may have been status symbols, pots for boilings meat, wine containers, and so on.²⁵⁰²

Lastly, an important marker of the awareness reached by the Etruscan elite was the adoption of the family, or *gentilic*, name, which developed in Etruria as early as the eighth century, as is known because it is widely documented in the earliest inscriptions, which date to the first half of the seventh century.²⁵⁰³ It is necessary to stress this custom, because family names in this period are exclusive to Italy; in Greek and other Mediterranean societies, the custom was to use a name consisting of the personal name and the father's name.²⁵⁰⁴ Instead, for both men and women, the societies of pre-Roman Italy adopted a distinctive two-component name formed from the personal name and the

family name. The family name made it possible not only to declare one's proud loyalty to a group, which in the eighth and seventh centuries was of course identified with the elite, but also to state the right to the inheritance of that name and the family properties, namely land and livestock. Inheritance, however, cannot have been the main reason for the introduction of the family name, because it was used by societies that did not adopt the family name system. Not by chance did the Latin law tradition attributed to the age of Romulus (753–716 according to traditional chronology) state that the owner (Lat. *herus*) can bequeath to his descendants (Lat. *heredes*) a plot of land (Lat. *heredium*) of 2 *jugera* (ca. 0.5 ha).²⁵⁰⁵ An important role was played by self-awareness of one's own high role and social status, as the rich and exotic grave goods show. In this way, the earliest Etruscan inscriptions, which show a high number of such binomial names, further stress the importance of the family name, whose origins in pre-Roman Italy are still an open question for research.

Fig. 47.2a: Line-drawing of the Etruscan inscription *TLE 155 = ET, Ta 6.1* *axapri rutile hipukrates*

If the coexistence of monumental graves, luxury goods, and family names helps to define the formation of elite Etruscans, other practices show that the aristocratic groups may have been interconnected in many ways to form a social network. These include gift exchanges, as attested in Etruria by inscriptions, and marriages, as in Homeric Greece. Several years ago, the late Mauro Cristofani pointed out that in Orientalizing Etruscan society, the practice of gift exchange between members of the elite, based on sumptuary goods, spread widely between 675–575. Precious gifts such as metal or clay vases with particular purposes show the donor's name—usually a man, but occasionally a woman—and sometimes the recipient's name.²⁵⁰⁶ In contrast, marriage as a useful link between two aristocratic groups is a practice documented in pre-Roman Italy as early as the Early Iron Age, although specific research on Orientalizing Etruria is yet to be done.²⁵⁰⁷

Fig. 47.2b: Line-drawing of the Etruscan inscription TLE 761 = ET, OA 2.2 mi *larθaia telicles lextumuza*

These practices seem quite typical of a dynamic society, which was open to strangers too. The literary tradition quotes the case of Damaratos, a Greek who came to Tarquinia from Corinth around the middle of the seventh century (Dion. Hal. *Ant. Rom.* 3.46.3). Etruscan inscriptions dating to the seventh century quote male names such as *Rutile Hipukrates* and *Larth Telicles* (Fig. 47.2a-b). These genuine Etruscan binomial names are half Etruscan (*Rutile* from the Latin *Rutilus*; *Larth*) and half Greek (*Hippokrates*; *Telikles*). The bearers can therefore be identified either as Greeks (*Hip-pokrates*, *Telikles*) who came to Etruria and assumed Etruscan names—"Hippokrates the Red" in the first case—or as sons of mixed marriages between Etruscans and Greeks.²⁵⁰⁸ In each case, such persons may be taken as examples of geographic mobility between members of the upper classes of Greece and Etruria.

Alongside so many elite markers, however, the archeological record of this period, which is based almost completely on funerary evidence, includes only a few traces of other classes; they are almost invisible. In the Banditaccia

cemetery at Caere, the huge tumuli were surrounded by similar but smaller burial monuments, which, being contemporary, may correspond to lower social groups. These may be related to the elite group in a way similar to that of the patrician and *clientes* in archaic Rome.²⁵⁰⁹

The late Richard Linington, who was for several years field director of the excavations in the Laghetto area of the Banditaccia cemetery, saw evidence of the existence of lower classes in the tomb architecture of that area. Linington divided the explored graves into seven periods, dating from the eighth to the third centuries. According to him, the dimensions of the graves in this area are quite similar to those in other cemeteries of Caere in the late eighth and early seventh centuries (his periods 1 and 2), a little bit smaller in the second half of the seventh century (period 3), and clearly smaller in the early sixth (period 4). If it is really the case that no more rich graves were built in this sector because the upper classes used other areas of the same cemetery, then from the sixth century onward it would have been available to the lower classes.²⁵¹⁰ To verify this intriguing suggestion, which is based exclusively on the study of tomb architecture, it would be necessary to correlate the architecture with the composition of the remains of the grave groups found in the same tombs, which is not possible at the moment given the fact that only a few tomb groups have been published.²⁵¹¹ Social division within an Etruscan cemetery dating to the seventh century has been documented at Pontecagnano in southern Campania. Several clusters of tombs that reflect different statuses and different origins of the deceased—mostly Etruscans but also probably Daunians and Picones—are placed in different sectors of the cemetery. Tomb groups of the Pontecagnano cemetery reveal a capacity for emulation and competition among the different elite groups; they include rich female graves.²⁵¹²

Toward the end of the eighth century, a woman was buried in Pontecagnano Grave 2465 not only with her gold jewels, but also with the markers of the rank she held in life: a bronze chariot; a bronze symposium service; a metal banquet service including andirons, spits, knife and axe for the meat—both for eating and for use in the sacrifice—and some large clay food containers (See [chapter 74](#) Cinquantaquat-tro and Pellegrino). Similar very rich female depositions in other Etruscan cemeteries show that such burials are not unique. To stress the spatial distribution across Etruria, one may mention at least Banditella 2 at Marsiliana and Regolini Galassi at Caere, both of which date to some time later than Pontecagnano 2465, in the first and second quarters respectively of the seventh century.²⁵¹³ The three female burials have several elements in common. Each includes either belongings of the deceased *dominae* in life (precious jewelry and metallic ornaments for clothing), or part of the burial ritual (metal bed frames, but only at Caere and Marsiliana), or the markers of their very high social rank (the metal chariot, the symposium service for wine, the banquet service for meat, and the large food storage vessels). Each set, which might have actually seen use, had a different

corresponded to a new role for women, is confirmed by iconographic representations. Concerning the iconographic record, one must begin in the Orientalizing period with the wooden throne found in Grave 89 of the Lippi cemetery in Verucchio, dating back to the very beginning of the seventh century.²⁵¹⁸ The scenes engraved on the semicircular back, originally painted, show women at work, engaged in the processing of wool—washing, spinning, and weaving—and women participating together with men in some activities that are hard to define. According to Patrizia von Eles, these women are probably engaged as priestesses in ceremonies or cults.²⁵¹⁹

Tomb 5 of the Arsenale Militare cemetery in Bologna, called Tomba del Tintin-nabulo and dated to around 600, has yielded the cinerary urn of a thirty to forty year old woman and her jewelry, gold items including a fibula and two hair bands, an amber chain, and an exceptional bronze sheet rattle or *tintinnabulum*, a bell-shaped pendant depicting several stages of processing wool, from spinning to weaving.²⁵²⁰ This exceptional find stresses once again the importance of wool working for high-ranking Etruscan women.

Fig. 47.3b: Line-drawing of the Etruscan inscription ET, Cr 2.36 *mivelelias θina mlaxmlakas*

The friezes on the terra-cotta plaques decorating the second phase of the palace near Murlo, dated to the end of the Orientalizing period (around the year 580), still reflect the Orientalizing world and its symbols. Four scenes are depicted in all, each including a woman with the attributes of her rank, such as thrones and footstools, parasol, fans, and servants. I agree with Annette Rathje that “these women must be seen as more than just mothers, wives, daughters and sisters to the ruling men.”²⁵²¹ A new phase probably began at the start of the sixth century (see [chapter 53](#) Amann).

3Kings and queens

Imported objects and their associated uses—if any—reflect the existence of a stratified society in Etruria, which for us is hard to articulate because the only information we have comes from burial remains. It must be remembered that the available documents have mostly been found in tomb groups, so it is not known exactly what role was played by burial customs and to what extent the

luxury objects correspond to the social status of the deceased.²⁵²² Specific criteria for categorizing tomb groups according to their richness are still lacking in modern-day research. Chariots and items such as helmets, shields, fans, and parasols (represented on the plaques from Murlo) are well documented by Etruscan finds as elite status symbols that derived, in the case of most of the objects, from Near Eastern, and in the case of helmet, Central European models.²⁵²³ The richest graves we have allow us to look for the deceased's particular roles and functions, such as kings and priests (see [section 4](#) below). According to the late literary tradition, in this period kings of Etruria had gold crowns, ivory thrones, scepters, and purple garments, all of which are symbols of power.²⁵²⁴ Can it therefore be suggested that the few tomb groups containing thrones and scepters belonged to kings or queens?²⁵²⁵ The archaeological evidence forces prudence; the general situation in Etruria might have been highly variable, depending on each location. The cemeteries of a very rich but relatively small center like Verucchio yielded eleven wooden thrones dating from 750 to 650, belonging to at least seven male and three female graves, with one not attributed. In the tombs of Chiusi, model bronze thrones belong to the funeral rites of rich male individuals dating to seventh and sixth centuries.²⁵²⁶ Thus the question posed above has no sure answer, although in few cases the attribution to kingly burials seems very probable. Only in the Barberini tomb group from Praeneste—a very rich inhumation outside Etruria in Latium Vetus dating to the second quarter of the seventh century (see [chapter 79](#) Naso)—has a bronze throne ([Fig. 47.4](#)) been combined with a probable scepter of gold and silver and a bronze cult wagon, suggesting the possibility that the deceased was an individual of royal status with priestly knowledge.²⁵²⁷

Fig. 47.4: Etruscan Bronze Thron from the Barberini tomb at Praeneste (Rome, Museum of Villa Giulia). Photo SAR-Laz

4Priests

Some specific finds from rich male and female burials allow us to assume for the deceased a probable role as priest. Bronze cult chariots, already documented in central Italic graves from the ninth century onward, attest to

religious rites involving the use of water (Fig. 47.5). The deposition of such items in tomb groups—mostly belonging to males, but in two cases, Bisentium and Veii, to females—may be interpreted as relics of such ceremonies or else as objects referring to the possible role of the deceased as priest.²⁵²⁸ The scenes engraved on the wooden throne from Verucchio and their interpretation by von Eles have already been mentioned, in which women are acting as priestesses. Perhaps not by chance, the Etruscan Tanaquil, wife of Tarquinius Priscus, the fifth king of Rome (616–579 according to the historical tradition), was believed to have deep knowledge of haruspicy, the Etruscan science of the interpretation of the livers of sheep.²⁵²⁹

It is difficult to identify a female role in votive offerings of this time, which are rarely documented in the archaeological record of the Orientalizing period for two main reasons. First, votive offerings were less popular than they would become beginning in the early sixth century, and second, because only a few votive deposits—consisting of highly perishable materials—have survived and they are quite difficult to find and to explore.²⁵³⁰ In an Iron Age votive deposit explored at Banditella, near Vulci, a bronze group has been found, which as one of the latest votive offerings of that context, has been dated to the first half of the seventh century. It now includes two horses, but was originally more elaborate and probably decorated the lid of an amphora.²⁵³¹

Fig. 47.5: Bronze cult-chariot from the Regolini-Galassi tomb at Caere (after Woytowitsch 1978, no. 123, pl. 121)

5The family

The shift from the protohistoric “clan” to the historical “family” is attested in Orientalizing Etruria through the adoption of the family name, but the composition of a “typical” Etruscan family in the Orientalizing period, if there was such a thing, remains obscure. Bone analysis and other anthropological research, which are definitive, are actually too limited to be used on a large scale.²⁵³² Inscriptions that show important phenomena like family names are scarce. The main sources for Etruscan society in general—the tombs—can be used in this context only in part. The development of the tomb architecture of the necropolis of Caere, as traced by Friedhelm Prayon, shows that the chamber tombs in the Orientalizing period do not have a unique form, but can include many chambers, and any one chamber can accommodate a varying number of individuals. By contrast, in the Archaic period, the chamber with two beds cut into the tuff was pervasive.²⁵³³ But caution is necessary: although chambers and beds can reflect the number of family members, we are not sure about the exact use of these structures. It is useful to compare our hypothesis with the few tombs that have been found intact. For instance, in the chamber with the ship painting in the Tomba della Nave at Caere, which contains only one bed dug into the tuff, Raniero Mengarelli found the remains of two individuals, a man on the bed and a woman in a wooden sarcophagus on the floor.²⁵³⁴

It is difficult to compare this tendency with the information from dwellings, because it is undefined and often refers to later periods (see [chapter 49](#) Nijboer). Taking into account the current state of the research, it can be interesting to ask some questions the answers to which will probably come in future years. For instance: how many people lived and worked in the palace of Murlo? According to a recent calculation, at least 350 individuals, including elite citizens, soldiers, craftsmen, and “service” personnel like butchers, dairymen, poultry farmers and gardeners, lived and worked in the Tartessian palace of Cancho Roano (Badajoz, Spain), which was smaller (24 x 24 m) than the Etruscan palace of Murlo (60 x 60 m).²⁵³⁵ The estimate is based on the theoretical consumption of the elite and not on the capacity of the palace. Although it seems somewhat high, because it counts different roles for some functions that were carried out by one person elsewhere,²⁵³⁶ the suggestion is useful for estimating the order of magnitude of the number of individuals involved. Future research will answer such questions.

48Ritual and cults, 730–580 BCE

Abstract: In Etruria, the passage from the late Iron Age to the Orientalizing period played an important role in the development of Etruscan funeral rituals and practices based on the aristocratic ideology. Greek and Oriental influences were decisive contributors to the process, as luxurious elements from the Near East became graves goods. Aristocratic funeral rituals were turned into sumptuous ceremonies, divided into several different stages—the display of the deceased, the ceremonial procession and the funeral lamentations—intended to increase the ceremony's pathos and its symbolic value.

Among the established funerary customs, the banquet practice gained more importance; it represents the aristocratic ties in the perpetual dimension of burial. Between the end of the eighth and the beginning of the seventh century BCE, we notice that the Etruscan banquet steadily developed Hellenic features because of the increasing relationships with the Greek colonies.

Spatial partition in graves also became more important during this phase. The importance of the grave structure related with the symbolic value of the ritual practice is more evident with the development of the great burial mounds in the necropolises of the Etruscan Tyrrhenian area.

In the Orientalizing period, funeral rituals in Etruria were intended to better celebrate the aristocracy, and was focused on the glorification of the deceased, who, entering the afterlife, took on the role of mythic ancestor and became an object worthy of worship for his/her descendants.

Examples of religious practices can be found in Etruria—even for this period—in several different sources. The consolidation of strongly elite worshipping models is evidenced by symbolic items among the grave goods and some figurative representations, which prove a close connection between the aristocratic worshipping models and the formation of an Etruscan-Italic mythical repertoire. At the same time, however, the emergence of the first urban religious structures, such as those of the sanctuary of Portonaccio in Veii, where female deities—previously limited to the aristocracy—gained an oracular value that turned deities into great civic goddesses during this period.

Keywords: Orientalizing period; funeral rituals; Etruscan aristocracy; religious practices in Etruria; worshipping models

1Funeral Ritual

In Etruria, the passage from the late Iron Age to the Orientalizing period played an important role in the development of Etruscan funeral rituals and practices based on the aristocratic ideology. Greek and Near-Eastern influences were decisive contributors to the process, as luxurious elements from the Near East became graves goods, not only increasing the richness of grave goods, but also their symbolic value. It was not merely about acquiring

goods and iconographies, but, new manners and demeanors. This new lifestyle was based on Eastern royalty and fitted to local customs; aristocratic funeral rituals were turned into sumptuous ceremonies, divided into several different stages marked by specific ritual practices.

Among the numerous examples to describe this passage we can observe the burial grave 871 in Casale del Fosso at Veii.²⁵³⁷ Its structure is reminiscent of the previous models, but the lateral *loculus* has been enlarged into an actual main chamber, where the most prestigious goods and the main pottery items were placed. The grave goods include local traditional banquet vases, but also a big bronze cauldron, some bronze ribbed bowls and a hemispherical silver bowl, all of which have clear Oriental origins. The presence of wagon items and a complete set of armor—including a bronze rolled helmet with a tall bronze crest—is very important and might indicate a sign of priestly authority,²⁵³⁸ which can also be connected with a bronze ritual chariot. There was also a footrest along with the throne, a bronze *flabellum*, and a wooden, ivory and gold-leaf scepter.

The cremation grave known as Lippi 89/1972 at Verucchio²⁵³⁹ represents a similar example (Fig. 48.1). In the grave were placed a cinerary urn “dressed” in a mantle and decorated with bronze, gold and amber *fibulae* and a double *panoplia* that included a high-crested helmet, a conical helmet, two swords, two shields, two spears and a javelin. The grave goods include four knives, one of which was found with an ivory and amber hilt (used for sacrificial rites),²⁵⁴⁰ three winged axes and several elements of a horse harness and three wagons. On the other side of the grave, opposite the cinerary urn, we can find a rich ceramic and bronze banquet set composed of a neck vase and a biconical vase, three *situlae*, seven *cistae* and a cup. There was also a wooden carved throne symbolically set above the big coffin, a footrest, a *flabellum* handle and a wooden box.

Both cases underline a complex and composite way of expression. The typical elements of the Etruscan tradition²⁵⁴¹ are enriched by the attributes of familial hereditary power, directly adopted from the oriental features.²⁵⁴²

Spatial partition in graves became more important during this phase, and gave a precise ritual meaning to each side of the burial. The importance of the relationship between the grave structure and the symbolic value of the ritual practice is more evident with the development of the great burial mounds in the necropolises of the Etruscan Tyrrhenian area. These massive structures, inspired by the eastern dynastic models,²⁵⁴³ stand as “great gravestones” of tombs of princes and their descendants, that tangibly indicate their land ownership and their aristocratic power.²⁵⁴⁴ These structures had a further role in funeral rituals, suggesting one of the most important ceremonial phases: the display of the deceased, which was one of the ritual key-steps²⁵⁴⁵ which emphasized social status and the family prestige.²⁵⁴⁶ This practice, in which the deceased and his/her grave goods were publicly displayed, is understood to have taken place on the burial mound itself.²⁵⁴⁷ Something similar can also

be observed in the contemporary burials in the Etruscan area in the Po valley, where the use of small mounds has been suggested.²⁵⁴⁸ In the most prestigious graves in Bologna are the famous *protofelsinee* stones²⁵⁴⁹, whose monumental origins were likely carved by the northern Syrian masters, directly commissioned by the local aristocracy.²⁵⁵⁰ The funeral ritual communication system at this stage is extended to the grave outside, showing the effort to make the symbolic message more lasting and forceful.

Fig. 48.1: Plan of the grave Lippi 89/1972 at Verucchio (after Torelli 1997c, fig. 42)

Other types of material remains of Orientalizing graves are evidence of another key-step of the aristocratic funeral richness—the transportation of the body to the burial site.²⁵⁵¹ In many prestigious graves there is documentation of several kinds of wagons, which have several symbolic meanings. The war chariot is an indication of upper-class men, the cart is usually related to women, while the transport carriage can be found in male and female graves as a symbol of aristocratic status and is connected with land and livestock ownership.²⁵⁵²

These means of transportation were supposed to be used for the displacement of the deceased during the ceremonial procession.²⁵⁵³ The most emblematic case is represented by the Regolini Galassi grave in Caere.²⁵⁵⁴ The buried princess was taken to her grave on a four-wheeled chariot, which was found in the access *dromos* with several items of the mortuary equipment. In some cremation burials in Verucchio, some chariot parts were burned, which suggests that the chariot itself functioned as a deathbed on which the body had been carried and cremated.²⁵⁵⁵ We can fully understand the

symbolic meaning of this ritual practice if we consider that the Near-Eastern symbolism of the corpse transportation vehicle was intended to turn the dead into a hero during his/her passage to the afterlife.²⁵⁵⁶

There's no doubt that funerals used to take place with a solemn procession, where a further exposure of the grave goods and funeral lamentations—to increase the ceremony pathos—had a large and important role. These practices are supported by the Latin literary tradition²⁵⁵⁷ for ancient Latium, and by archaeological traces in Etruscan graves. In the Regolini Galassi antechamber, there are forty weeping bucchero statuettes placed around an empty deathbed. Several bronze and ceramic vases are reminiscent of celebratory banquets, and some shields leaning against the walls—which were typically used to decorate halls in aristocratic houses²⁵⁵⁸—may also be traces of the display of the corpse. In Pitigliano, there are weeping female and mourning knight figurines on the edge of a ceramic lebes (Fig. 48.2).²⁵⁵⁹ These are evidence of a different aristocratic ceremonial element. It has been suggested that the male figurines refer to a funerary knight joust, perhaps the Etruscan and Italic *Lusus Troiae*,²⁵⁶⁰ which is documented by Latin literary sources,²⁵⁶¹ and which consisted of performing a carousel (*decursio*)—riding a horse around the corpse—to glorify the deceased and confirm his entrance into the afterlife by the members of his own social class.²⁵⁶²

Fig. 48.2: Ceramic lebes from Pitigliano with female and mourning knight figurines on the edge. Second half of the seventh cent. BCE. Florence, Archaeological Museum (photo SAT)

Among the established funerary customs, the banquet practice gained more importance, as it represents the aristocratic ties to the perpetual dimension of burial. Between the end of the eighth century BCE and beginning of the seventh, the Etruscan banquet steadily developed Hellenic features,²⁵⁶³ because of the growing relationships with the Greek colonies.²⁵⁶⁴ The ceramic

cinerary lid in Montescudaio, dated to the mid seventh century, shows the deceased being served by a maidservant, sitting on a three foot long table next to a large crater for wine and water blending (Fig. 45.9). This is the representation of a purely Homeric Greek banquet; it pays particular attention to the convivial features, which became more and more essential in the Etruscan banquet practice. The bronze or silver gilt bowls and the impressive ceramic pottery sets imported from Greece or copied *in loco* are common in the graves of the member of the elites, and attest to these new banquet practices. The full adherence to the Homeric conviviality is also represented by the collective consumption of meat, a precious meal directly connected to the sacrificial ceremonies of animals and therefore, with the religious domain,²⁵⁶⁵ as shown by large sacrificial knives, large bronze cauldrons, tripod, spits and andirons in upper-class male and female graves.

Spinning tools and weapons still had a distinctive gender role in funeral ceremonies. Personal items give useful indications about the deceased and his/her individuality. These elements were clearly expressed in areas in which cremation was the prevailing practice, such as the Po valley, where the anthropomorphism of the cinerary urn was very important,²⁵⁶⁶ and northern Etruria—especially in Chiusi—where local elites distinguished themselves by anthropomorphic funeral urns, the *canopi*,²⁵⁶⁷ which were frequently placed on thrones with personal ornaments and marks of power (Fig. 48.3).

In women's graves, spindles, spindle whorls and distaffs were found made of precious materials such as bronze, amber, bone and glass paste. These are of a highly symbolic value, and refer to an aristocratic woman's role in her household and economic management.²⁵⁶⁸ A *tintinnabulum* that dates to the last part of the seventh century was found in the "Tomba degli Ori" in the Arsenale Militare necropolis at Bologna (Fig. 29.6).²⁵⁶⁹ It is one of the famous bronze pendants²⁵⁷⁰ typical of upper-class women's graves during the Orientalizing period in Bologna. It features embossed portrayals of the different stages of wool manufacturing by richly dressed upper-class women. Clearly evident is the intent to emphasize the aristocratic status of this symbolic traditional activity in the economy of the family, in which the woman's role was very important.

As for men's grave goods, the indications of power become more complex during the Orientalizing period. Items such as wooden, bronze and silver scepters in grave 5 in the Monte Michele necropolis at Veii²⁵⁷¹ show the acquisition of self-representative oriental models by the Etruscan aristocracy. However, the local symbolism of axes as indications of aristocratic power remained, and led to some extraordinary artifacts, such as the axes with wooden handles covered in bronze in graves H1 and H2 at Casale Marittimo.²⁵⁷² The bundle of iron rods (*fascēs*) surrounding a double edged axe (*bipennis*) in the "Tomba del Littore" at Vetulonia show how axe symbolism was still extremely important in male characterization, and suggests its evolution into an indication of magisterial power during the

Fig. 48.3: Anthropomorphic urn or *canopo* on throne from the grave 253 of Tolle (Chianciano), End seventh cent BCE. Chianciano, City Museum (photo SAT)

The described picture clearly shows how funeral rituals in Etruria were structured to better celebrate the aristocracy and its top-members. This process is focused on the glorification glorify of the deceased, who would gain the role of mythic ancestor and became an object of worship for his/her descendants upon entering the afterlife. This conceptual component was so

strong that it became totally explicit in several cases, and it is not a coincidence that the first examples of stone and *terracotta* statues in Etruria are linked to these ideas. One of the most famous examples is the relief carvings of the deceased's ancestors seated on thrones²⁵⁷⁴ in the hall of the “Tomba delle Statue” (Tomb of the Statues) at Ceri (690–670 BCE: Fig. 35.4).²⁵⁷⁵ A similar guarantee and legitimacy function had the small five *terracotta* statues in the “Tomba delle Cinque Sedie” (Tomb of the Five Chairs) at Caere, dated to 630 BCE.²⁵⁷⁶ These statues were placed in a reserved room, where the deceased's ancestors are depicted during a banquet in which two empty seats suggest the participation of the two grave owners.²⁵⁷⁷

The glorification of a family's status and its social and political function is predominant, beginning in the last decades of the eighth century, both in funeral rituals and in the idea of the afterlife. Paintings both in the Tomba delle Anatre (Tomb of the Ducks)²⁵⁷⁸ and the Tomba dei Leoni Ruggenti (Tomb of the Roaring Lions) (Fig. 45.8)²⁵⁷⁹— the oldest examples of funeral painting in Etruria, both of which are in Veii and date to the beginning of the seventh century—portray monstrous aquatic birds and underworld creatures. These figurines are still closely connected to the figurative representations of the previous century. In contrast, we can observe a complex figurative representation on the walls of the late Orientalizing “Tomba Campana,” which shows many iconographic oriental features.²⁵⁸⁰ The glorification of the deceased, drawn on a horse in his triumphal entrance to the underworld with his marks of power, was by then completely expressed.

2Forms of worship

Examples of religious practices can be found, even for this period, in several different sources. In addition to plastic and figurative representations we can notice more sacred structures in the urban areas in Etruria.

As for the plastic representations, we must first mention the small naked ivory goddess coming from “Circolo della Fibula” in Marsiliana d’Albegna²⁵⁸¹. The statuette represents a fertility goddess,²⁵⁸² and its iconography is very similar to that of Ishtar, a goddess worshiped in Syrian and Phoenician areas. The statuette has been attributed to an immigrant manufacturer and is evidence of the oriental influence in the worship of female deities already attested in the previous stage.²⁵⁸³

The wooden throne in the Lippi 89/1972 grave at Verucchio features two overlapping scenes carved on its back (Fig. 48.4). The upper part is a scene of wool manufacturing, in the middle are two weaving scenes in which women sitting on a thrones are working on tall vertical looms, and the lower scene depicts two converging wedding processions with a woman and a man in a chariot. In the middle of the two processions is a big platform decorated with waterfowl, which most likely indicate the afterlife. The platform is guarded by a rank of warriors armed with spears, crested helmets and oblong shields. Above them, two women exchange gifts, in the form of tissues and clothes (although it has not been possible to positively identify the items they hold in their hands). The scene ritual value has already been explained, both in its social and political meaning²⁵⁸⁴ and in its relation with the ceremony form and place. We therefore have to underline the location and the actions in the middle of the lower scene, which most likely depicts wedding processions.²⁵⁸⁵ In their middle we can see gift exchanges, represented by tissues and clothes. This exchange is depicted in a detached area from the inhabited one²⁵⁸⁶, maybe at its boundaries, and is emphasized by sacred elements such as waterfowls indicating the afterlife. It has also been suggested that the women are performing sacred activities,²⁵⁸⁷ as the objects they hold in their right hand—possibly big knives²⁵⁸⁸—might indicate. Despite the varied interpretations, we must highlight that we find on the throne one of the most ancient representations of a suburban sanctuary, protected by the military and a guarantor of exchanges and/or religious practices, involving different groups of people. That seems to anticipate the fundamental role that great sanctuaries in Etruscans *emporia* will have during the following centuries.

As further examples of this interpretation we can also add two archeological finds from different findspots, but with almost the same figurative set. A series of small tin *lamina* figurines was found in the Lippi B/1971 grave at Verucchio²⁵⁸⁹ and dates to the end of the eighth and the beginning of the seventh centuries. The *laminae* constituted a sole set: on the sides of a vertical element two warriors with round shields, half-sphere helmets and spears stand opposite one another. Behind each warrior is a semi-monstrous beast with its jaws wide open. Above the two warriors are aquatic birds and a cross-shaped pattern. A very similar scene is carved on a slightly more recently discovered golden *fibula* at Vulci Ponte Sodo (Fig. 48.5).²⁵⁹⁰

The compositional scheme and the subjects are the same: two fighting warriors, with waterfowl and a cross-shaped pattern above them, and semi-monstrous beasts behind. The iconographical affinity is clear: in both cases a duel is depicted, which does not indicate a war, but a private competition with strong symbolical elements that refer to the afterlife. The birds are connected with the relationship between the scene and the celestial sphere; the cross-shaped elements are reminiscent of the solar and cosmic sphere. The beasts refer to the underworld and evoke its not human trait. The analogy between these scenes and the Roman saga of the twins Romulus and Remus has been suggested in the context of the formation of an Etruscan and Italic mythological repertoire.

Fig. 48.5: Golden fibula from Vulci, Ponte Sodo. Munich, Antikensammlungen (after

As for the ruins of worship areas, there was a continuation in the sacred area of Pian della Civita in Tarquinia,²⁵⁹¹ where in the seventh century the first important masonry palace was built, composed of two rooms in sequence with a sacrificial altar at one end. Outside, a votive deposit has been found, in which was found a *lituus* (Fig. 45.2),²⁵⁹² an intentionally damaged shield, an axe, and ceremonial pottery. This deposit has been interpreted as an offer made by a powerful local person, probably a king, or as plunder taken from an enemy king and sacrificed to the gods.²⁵⁹³ The whole complex was renovated and fenced in during the mid seventh century. Also in this area, the body of a deceased woman has been found, who might have been connected to the worship of female deities;²⁵⁹⁴ it is possible that the woman was a priestess. These ritual burials seem to be a sacred part in the trans-generational continuity in the Tarquinian community, and as such, are strong elements of cultural identity.

The initial building stages of the sanctuary of Portonaccio in Veii date to the end of the seventh century. During this same period a first altar might have been placed, and a paved stone plan for a wooden structured aedicule were created. A large amount of oblations are gathered around these places, including Etruscan and Corinthian ceramics and several *ex voto* and inscriptions clearly related to female deities.²⁵⁹⁵ The complex was almost entirely dedicated to *Menerva*,²⁵⁹⁶ who is closely related to fertility and breeding, and her worship there was probably oracular.

The sacred area of Sant' Antonio at Caere²⁵⁹⁷ is a further example of stable sacred building in Etruria. The sanctuary was expanded to its maximum size between the late archaic Archaic and the classical Classical periods; the main earlier structures were some cavities discovered between the later constructions, a tank and a building with three rooms connected by a lengthened one. These structures were left during the late sixth century. The worship function of these kinds of buildings has not been fully clarified, but we can suppose that the tripartite plan building, which dates to the seventh century, is one of the oldest examples of an aristocratic masonry house in Etruria,²⁵⁹⁸ and testifies to a close relationship between the worship administration and the aristocratic houses models.²⁵⁹⁹

These last examples lead us to focus on a key-conceptual shift in the evolution of these forms of worship. We can observe the consolidation of strongly elite worship models, shown by symbolic items in the grave goods and by an aristocratic administration of ceremonies. That has been widely emphasized by the themes of funeral rituals and figurative representations, which show a close connection between the aristocratic worship models and the formation of an Etruscan-Italic mythical repertoire. At the same time, however, the first urban religious structures emerged. This must be the meaning of the worship of *Menerva* in Portonaccio sanctuary at Veii, where the worship of female deities, previously reserved for the aristocracy, gained

their oracular value, and turned deities into great civic goddesses.²⁶⁰⁰

We therefore note a triggered process, which led to more mediated worship models, as suggested by the example of Sant'Antonio in Caere. These models brought a more communal administration to the religion, and became typical of the great urban sanctuaries during the following centuries.

49Economy, 730–580 BCE

Abstract: In this chapter a divide is presented between the economies of:

1. The Early and Middle Orientalizing period (730–640/630), with its lavish levels of wealth and conspicuous consumption as documented in funerary rituals. This phase also records the emergence of monumental architecture, tombs and infrastructure; and
2. The Late Orientalizing period (640/630–580), with its rising urbanization, increasing workshop mode of production and expanding markets for better quality, mass-produced commodities.

The shift between this divide is exemplified by the transition from huts to houses during the Late Orientalizing period but can also be illustrated by the imitation of luxury products in more modest materials. Stylistic conformity and devaluation were the result, revealing close relations between the various crafts. The economy remained largely landlocked. The increasing exploitation of the available resources rose gradually, starting from patterns that became established during the eighth century. However, during the seventh century, the scale and differentiation of the economy in Etruria enlarged significantly assisted by considerable population growth. Surveys have shown that the countryside around major centers became more and more inhabited with minor settlements. Hierarchies of craft workers evolved with differences between primary, secondary and tertiary settlements. Specialization was most advanced in the capitals of the rising city-states. The demand for ceramics during the late seventh century probably established early nucleation of pottery workshops at key sites such as Veii, *Caere*, Tarquinia, Vulci, and Vetulonia. At secondary settlements the process of craft specialization occurred as well but not to the same extent as in the main power centers.

Market conditions and exchange by quantification were more developed in the trading sites along the coast for the management of long-distance exchange with overseas traders. Most local exchange was still reciprocal and by barter. Many farmers lived in or near the key centers and acquired progressively more products from specialized workshops, reflecting the growth of interior markets.

Uncertainties remain about the economic role of war and of rising institutions. It is probable that ongoing economic growth created opportunities for many and that enduring warfare was absent to some extent as long as the surrounding hinterland of the rising Etruscan city-states was not fully exploited and dominated. Institutions were predominantly run by the leading families of various clans. By managing labor and exchange, their hold on the increasingly more complex economy of Etruria had become considerable.

Keywords: Standardization, urbanization, settlement hierarchy, workshop mode of production, expanding demand

Introduction

Most of the economic principles and models presented for the Iron Age (see [chapter 43](#) Nijboer) remain valid for the Orientalizing period, since the

economy continued to be essentially agricultural and landlocked, though labor became increasingly controlled by the upper classes.²⁶⁰¹

For transparency, this phase is subdivided into:

The Early and Middle Orientalizing period: 730–640/630 and

The Late Orientalizing period: 640/630–580.²⁶⁰²

During the Orientalizing period, Late Villanovan centers developed into a network of emerging Etruscan towns. The socioeconomic progress that is recorded for the second phase of the Early Iron Age (EIA 2) continues during the late eighth and early seventh centuries.²⁶⁰³ Elaborate warrior tombs of EIA 2 became *tombe principesche* that predominantly contain a mix of high-value local goods, table-wares in gold and silver and numerous oriental *keimélia*. These tombs demonstrate that the Etruscan upper classes were increasingly able to appropriate surplus-production and wealth. Nonetheless they still lived in settlements and proto-urban centers with huts, some of which became more monumental during the seventh century. Full craft specialization continues to be documented in prestige goods until around 650.

Besides continuity, there are some basic differences between EIA 2 and the Orientalizing period. Urbanization led to substantial economic growth that differentiated previous customs of production and exchange. The Orientalizing period in Etruria refers increasingly to the Eastern Mediterranean with its more complex socioeconomic institutions.

The main differences between EIA 2 and the Orientalizing period are:

- The mounting exploitation of the local resources in the hinterland of main centers resulting in a settlement hierarchy;
- The evolution from household production of goods to workshops, also for ceramics – The emerging replacement of huts by houses;
- The rise of monumental architecture, tombs and defense works, marking an increase in corvée labor; Forms of early state formation;
- The final upsurge of a short-lived period of Etruscan overseas trade that flourished from around 600 to 500.

1Demography

A rise in population is documented by the transition from huts to houses and by changes in settlement patterns. In some central Italian settlements, groups of huts dating to the eighth and seventh centuries have been excavated, which so far do not reveal a very close packing of structures. Huts are freestanding and surrounded by open space, which greatly affects the feasible population density in such settlements. The transition from huts to houses from around 640–630 onwards led to a denser concentration of homes in the main centers. The early urbanization process, which was fully established in the sixth

century, resulted in primary centers that housed thousands of people. In addition a clear settlement hierarchy around these primary centers emerged. This infill of the countryside, with more permanent, secondary and tertiary settlements, suggests an intensification of land-use and larger population densities in the hinterland as well. Including the population in the countryside, the number of people in the territories of the early Etrurian city states may in some cases have risen to 10,000–15,000 people or more by 580.²⁶⁰⁴ When compared to the figures for around 730, this would indicate at least a doubling of the population in a period of about 150 years.

I maintain low to average figures. Some calculate higher numbers, but a soaring growth in population is unlikely since the economy remained basically agricultural and not industrial. Comparison with other early civilizations makes it probable that population increase was slow rather than rapid.²⁶⁰⁵ Moreover, the high rate of infant and child mortality did not change much. On the other hand people from outside Etruria might have moved to the emerging, booming Etruscan centers; rapid economic growth usually attracts people from elsewhere. Some suggest a mean population density of about 100 people per hectare in the primary Etruscan centers. This would equal means given for more urban sites such as Mid-Republican Cosa or for various cities in Northern Italy during the fourteenth century CE.²⁶⁰⁶ Such a level of urbanization is unlikely for Etruria during the Orientalizing and even the Archaic period. An average of fifty inhabitants per hectare still gives us several thousand inhabitants for some primary centers in Etruria during the sixth century.

It is concluded that the demographic trend of EIA 2 did continue and that there was a significant increase in population during the Orientalizing period, which considerably affected the scale and organization of the economy.

2Agriculture, resources and their intensified exploitation

The demographic growth was sustained by increased use of the surrounding farmland. The gradual infill of the hinterland around the primary Etruscan centers is recorded in the form of larger and smaller villages, and provides evidence for a growing exploitation of the agricultural and mineral resources.²⁶⁰⁷ By the eighth century, the population was large enough for the existence of nucleated settlements while being simultaneously small enough to live from the land immediately surrounding these centers. With further population growth, more fields—including remote fields—were exploited, and farmers started settling in the countryside.

Flavio Enei surveyed a section of the territory of Caere and found a considerable rise in the number of sites in the countryside during the seventh

and sixth centuries.²⁶⁰⁸ A systematic exploitation of the territory is registered, similar to that noticed in the territory of Veii and elsewhere.²⁶⁰⁹ Enei recognized 113 sites. In the most fertile areas, some of these were located almost next to each other indicating regular, agricultural plots. The evidence implies small square or rectangular buildings of 20 to 50 m², covered with tiles of varied manufacture. Pottery included storage jars, cooking stands and loom weights. Grindstones were recovered as well. Many of the ceramics were made from a red-brown *impasto*, while the tableware is predominantly bucchero. Transport amphorae of diverse provenance were frequently encountered. Thus some of the products recovered in these hinterland sites derived from pottery workshops elsewhere, which suggests expanding home markets. In addition, a range of burial grounds was distinguished, from rural to urban, revealing permanent and stable habitation sites of country people in various types of settlements.²⁶¹⁰ The intensification of agricultural production is eventually verified by the production of Etruscan transport amphorae from 600 onwards.²⁶¹¹

Another remarkable feature of land use, especially in southern Etruria and parts of Latium vetus are *cuniculi*, the monumental water-controlling shafts for drainage and water supply cut in the bedrock, some of which are a few kilometers long.²⁶¹² They might pertain more to the sixth century and later but it is probable that their construction started around 600.²⁶¹³

A comparable intensification, as recorded for the agricultural land, is documented for the metal ore resources. Acquarossa and Populonia provide fine examples for the increasing exploitation of minerals in Etruria.²⁶¹⁴ The archaeological evidence from both sites reveals a development from village to early towns, which makes it unlikely that we are just dealing with mining as *corvée* labor.

3Territorial control over resources

Territorial control over resources was directed from the main centers in Etruria. Road networks, *cuniculi*, and settlement patterns radiate from these primary towns into the hinterland.²⁶¹⁵ The rise of high status tombs in the countryside from 650 onwards suggests that agricultural resources were controlled by the upper class. Nonetheless private ownership of land is still reconstructed as limited because clan-heads/ patrons provided access to these resources for their clans/clients. An example of territorial control is provided by Casale Marittimo in northern Etruria. The remarkable finds record an upper-class family living in the countryside during the Orientalizing period. It is implied that Volterra, 15 km northeast of Casale Marittimo, regulated these small-scale, elite exploits.²⁶¹⁶ This pattern of the upper classes gradually occupying and informally claiming the hinterland coincides with a model

proposed by Andrea Zifferero,²⁶¹⁷ who suggests that territorial control is first documented in the rise of monumental tumuli in the countryside around the primary centers during the Orientalizing period.²⁶¹⁸

A number of secondary centers, emerging from the eighth century onwards, might have had an autonomous development, to some extent. However, the economic-political weight of many of these sites altered or declined during the sixth century with strengthening processes of city-state formation. An example of this phenomenon is Marsiliana d'Albegna, where there is an exceptional number of high-status tombs.²⁶¹⁹ No other site besides Vetulonia revealed so many bronze ribbed bowls, one of the status markers in Italy, while Adriana Emiliozzi lists fourteen chariots/wagons/ carts mainly dated to between 700–650.²⁶²⁰ Some of these tombs also contained gold, silver and ivory. The data imply that several specialist craftsmen, working for the upper classes at Marsiliana d'Albegna, were fully employed producing these prestige goods.²⁶²¹

Fig. 49.1: Acquarossa, the three settlement areas, two metal ore deposits in walking distance and some burial grounds 1. Acquarossa; 2. Ferento; 3. M. Piombone; 4. Ore deposit of Solfatara; 5. Ore deposit of Macchia Grande (from Zifferero 1991a, fig. 13)

Acquarossa provides another example of a site that grew considerably

during the Orientalizing period but declined during the late sixth century (Fig. 49.1). Its development seems to be closely linked to the expanding exploitation of its nearby metalores.²⁶²² Thus the archaeological data document an increase in scale of the economy, and tightening territorial control over resources during the Orientalizing period.

4Exchange network

The overland exchange network, covering large parts of the peninsula, continued to flourish. For example, Baltic amber, which was distributed overland, was ever more deposited in female tombs during the period between 730 and 650. Throughout this phase, the demand for high-value goods grew rapidly thanks to conspicuous consumption not just in the primary Etrurian centers but also elsewhere, as illustrated by sites like Marsiliana d'Albegna, mentioned above. A register of high-status tombs and their long-distance imports does not exist, but elite markers such as chariots and bronze ribbed bowls give a hint to the scale of the phenomenon. Thus Emiliozzi assigns around ninety tombs with chariots/carts/wagons in Etruria to the Orientalizing period.²⁶²³

The overseas network with traders/craftsmen intensified as well. The import of particularly Levantine luxuries during the eighth century appears to have been associated with freedom of trade. This kind of trade initially develops when small groups originating from elsewhere are involved, such as traders from various Phoenician city-states and Euboean settlements. Mediums of exchange, weights and other units appeared and the market principle became incorporated, especially for trade in metals and long-distance commerce. Moreover, this stimulated internal changes in the modes of production, which subsequently became directed to the Etruscan involvement in an overseas trading network. From around 600 onwards, the export of Etruscan transport amphorae, bucchero and other commodities to mainly southern France, documents the effective transition of the domestic economy (Fig. 49.2), which is associated with a rising standardization of local goods produced in workshops (see below).

According to Olaf Höckmann, the Iron Age Etruscan boat models were predominantly used for inland navigation on rivers and lakes.²⁶²⁴ Larger vessels are depicted in Etruria from around 700 onwards, including seaworthy “hybrid” boats with local, Phoenician and Greek shipbuilding characteristics.²⁶²⁵ Some ships and traders from Etruria participated in the seaborne trading network as partners of Phoenicians and Greek speaking groups. *Emporia* or entrepôts are an intriguing feature of this network.²⁶²⁶ Some of these trading posts are well defined, such as the *emporion* at Pyrgi and Gravisca. With the rise in scale, commerce with foreigners became consigned

to neutral locations along the coast. Freedom of trade with overseas merchants became regulated trade during the seventh century.²⁶²⁷ The upper classes in Etruria took measures to control economic relations with their overseas partners, thus protecting existing domestic socioeconomic arrangements.

Fig. 49.2: Find spots of Etruscan amphorae and Etruscan fine tableware, especially bucchero (compiled by A. Naso)

5Practice of exchange

Based on growing patron-client relations within a clan structure, reciprocity in all its variations remained at the heart of the local exchange mechanism in Etruria.²⁶²⁸ Some of the collected surplus production was redistributed by the upper classes during feasts and religious ceremonies while conspicuous consumption is mainly recorded in funerary rituals.²⁶²⁹ The necessary prestige goods were produced by specialized craftsmen, who were employed by the elite.²⁶³⁰

Close relations with Phoenician and Euboean merchants and craftsmen led to the adoption of specific metrological units and the alphabet around 700.²⁶³¹ It seems that in gateway communities, exchange with strangers was sanctioned by ritual and religious convention originating from a formalized guest meal/banquet between members of the Etruscan upper classes and their overseas guests.²⁶³² Metrological units are associated with the production and exchange of metals and with agricultural surplus production as marked by the Etruscan transport amphorae. A lucid context illustrating the use of metrological units is the wreck at Campese Bay near Isola del Giglio, which dates to between 590/580,²⁶³³ whose cargo included merchandise of diverse

provenance.²⁶³⁴ In addition to unprocessed amber, pitch, raw and worked metals, it contained fifteen Greek transport amphorae from Corinth, Sparta and Samos and one from a Phoenician-Punic center. Around 130 amphorae — the majority — were Etruscan. The contents of the amphorae mark the commercial exploitation of pines and olive groves in Etruria.²⁶³⁵ The commodities on board reflect a wide exchange circuit while the ship went from relay point to relay point, at each place both exchanging and loading commodities resulting in mixed cargo. The presence on the ship of some weights and more or less standardized vessels, such as transport amphorae, substantiates the notion that certain goods were exchanged in Etruria by quantification within an early, market mechanism. This mechanism emerged soon after the arrival of Phoenician and Euboean traders during the late ninth and eighth centuries.²⁶³⁶ By 650, metrological units were acknowledged in gateway communities and other trading places. For local exchange, however, quantification seems to have been limited. In rising towns, many goods were made in workshops by 600, but these seem to have been partially transferred within restricted market conditions. Most of the domestic exchange was probably still by barter and continued to be reciprocal.

6 Primary evidence on production; the rise of workshops

The primary evidence on production suggests a hierarchy in craft specialization that is in line with the emerging settlement hierarchy. In main centers a range of workshops became established while in small sites, part-time specialization was dominant. The Orientalizing period saw the evolution from household production of goods—including ceramics—to workshops. For example, some ceramic vessels from Tomb 7 at Poggio Buco were made in series during the Late Orientalizing period. Another example is provided by the ceramics produced at Veii. Surveys and excavations have established the existence of areas on the extensive plateau where ceramics were produced from the Iron Age onwards.²⁶³⁷ The output of craftsmen gradually included more standardized, customary goods. Increasingly high-volume/low-value artifacts were produced in early urban workshops from around 650 onwards.

In the main Etruscan centers, complex levels of industrial specialization are found. During the Orientalizing period there are a number of ware groups that suggest various ceramic workshops in these centers. For example, the local production of bucchero is attested for several sites. The development of the bucchero production was described as “*pièces de prestige (au VIIe s), pièces de demi-luxe perpétuant une tradition aristocratique (fin du VIIe et VIe s) et pièces utilitaires communes (fin du VIe au IVe s).*”²⁶³⁸ This transformation of the bucchero production characterizes the change of the entire ceramic

industry in Etruria.²⁶³⁹ Besides bucchero, other main ware groups, such as *impasto rosso* and tableware made from depurated clays on a fast wheel, were increasingly produced in workshops.²⁶⁴⁰ It is especially in the production of ceramics that we witness the rising quantities of “*better quality, mass-produced commodities*” or low value/high volume goods in main centers such as Caere and Tarquinia.²⁶⁴¹ The output of the various crafts in the major centers of Etruria makes it probable that nucleation of workshops arose during the Late Orientalizing period. The existence of several workshops per profession in one settlement is a characteristic of early towns requiring a population of at least several thousand.

At secondary centers more mixed arrangements for craft specialization are recorded. Poggio Civitate is discussed in some detail here and provides a fine example of a monumental building complex in the countryside, where a number of crafts were performed from around 640 to 550/530.²⁶⁴² The monumental buildings at Poggio Civitate were part of a small settlement. Loom weights, spools and spindle-whorls are common and reveal the domestic production of textiles.²⁶⁴³ Among the architectural ceramics, there are quite a few that belong to the earliest examples in central Italy. The life-sized terracotta figures and substantial drainage pipes exemplify the outstanding competence of the artisans who erected these buildings.²⁶⁴⁴

Two major building phases are reported. The first phase dates to the period between 640–590, in which the southeast building or stoa-workshop is singled out.²⁶⁴⁵ It is a spacious, roofed area that was open on all sides for adequate light and ventilation, and can be dated to 630.²⁶⁴⁶ The manufacture of tiles and architectural decorations in this workshop is verified. Moreover, industrial waste from the processing of other materials like ivory, bone, and metals, was recovered in or around the structure.²⁶⁴⁷ Therefore, one of the functions of the building was to serve as a manufacturing area. Around 590 the stoa-workshop was destroyed by fire. The large, rectangular buildings at Poggio Civitate were replaced by an impressive construction with a generous, colonnaded central courtyard.

The unitary style at Poggio Civitate in both the terracottas and other pottery reflects an organization of the ceramic craft, which involved both potters and coroplasts.²⁶⁴⁸ It has been established that tiles, ceramic statues and *impasto* household wares were locally produced from the same clay deposit.²⁶⁴⁹ Progress in efficiency is documented in the roof tiles because the early specimens are not as standardized as those produced around 590/580.²⁶⁵⁰ Thus the pottery workshop at Poggio Civitate made architectural terracottas, common household vessels and tableware besides elaborately constructed bucchero cups with molded handles. A similar close relation was noticed at other secondary sites. This supports the view that in several settlements in Etruria a range of materials were processed near to each other, possibly in one workshop.²⁶⁵¹

Another example of a secondary site is Acquarossa that was briefly

mentioned above in relation to the exploitation of its nearby metal ores (Fig. 49.01). The transition from huts to houses in Etruria from around 640/630 onwards created a massive demand for tiles, which can best be exemplified by the site of Acquarossa, where huts were replaced by buildings with stone foundations and tiled roofs.²⁶⁵² Construction proceeded and the site grew in a relatively short period to include numerous buildings at the time of its destruction around 550/525.²⁶⁵³ The detailed publications by Örjan Wikander allow for some quantification of the output.²⁶⁵⁴ More than one pottery workshop probably existed at Acquarossa. Workshops that modeled the ceramic building materials increasingly absorbed the manufacture of other coarse, household and tableware. In time, the household production of these ceramics became restricted, especially in the larger settlements. Thus the upsurge in building activities at Acquarossa and elsewhere suggests a concentration of workshops at the sites that acquired urban characteristics during the sixth century.
